Peer review Scholars has been invited to submit researches on theoretical and methodological aspects related to Heritage, Architecture and LanDesign, and show real applications and experiences carried out on this themes.

Based on blind peer review, abstracts has been accepted, conditionally accepted, or rejected. Authors of accepted and conditionally accepted papers has been invited to submit full papers. These has been again peer-reviewed and selected for the oral session and publication, or only for the publication in the conference proceedings.

Conference report 200 abstracts received from:

Australia, Austria,
Brazil,
Canada, Chile, China, Cyprus,
Denmark,
France,
Germany, Greece,
India, Israel, Italy,
Jamaica, Jordan,
Kingdom of Bahrain, Kosovo,
Lebanon,
Malaysia, Malta, Morocco, Mexico,
New Zealand,
Poland, Portugal,
Russia,
Serbia, Slovak Republic, Spain,
Tunisia, Turkey,
Ukraine, United Kingdom, U.S.A.

About 300 authors involved.

157 papers published.

Preface The XI edition of the International Forum Le Vie dei Mercanti entitled Heritage, Architecture, LanDesign aims to promote an international debate on local experiences relating to the issues of conservation, regeneration and innovation in heritage, architecture, landscape and design.

In recent years, technological developments have revolutionized not only the forms that surround us but also our daily routines. However, this new global language often does not take into consideration the identity and vocation of the area, which require appropriate courses of action in relation to both the individual context and local traditions.

The historical memory of the characteristics of the identity, local materials, building traditions as well as the tangible and intangible cultural heritage is a repertoire of signs to draw from in order to operate within each historical context and consequently enhance its uniqueness.

The recovery of the authentic vocations of a place does not mean inaction, but rather regeneration through measures to enhance an area by increasing its natural strengths, transforming the weaknesses into opportunities for future development based on innovation.

The international comparison can be an opportunity to share good examples of conservation, regeneration and innovation related to the tangible and intangible heritage in its broadest sense; architecture intended as the identity of the places that shapes the landscape, from traditional to global forms; design at all scales, from the object to the territory, in a sustainable way to start a process of regeneration through a new relationship between man and the environment.

The conference is open to multidisciplinary experiences of one or more of the proposed themes. Scholars are invited to submit research on theoretical and methodological aspects as well as present experiences and practical applications carried out on these issues.

Architecture, heritage, landscape, in time of crisis

Carmine GAMBARDILLA

Department of Architecture and Industrial Design "Luigi Vanvitelli", Second University of Naples, Italy
carmine.gambardella@unina2.it

In this times of crisis, there has been a return to discussing the value of cultural, architectural and landscape heritage, with the use of quite worrying terms such as "consumption" of art or "offer" of culture, almost as if they were goods to be sold to "consumers" or sold off to the highest bidders.

The problem of the commodification of cultural and environmental assets in Italy, launched more than 10 years ago, is still far from having found a solution. It was July 2002 when the most important German newspaper, the "Frankfurter Zeitung Allgemeine" broke the news of the Italian law which made the alienation of state assets possible, including the cultural ones, with an article entitled "The Taliban of Rome. End of season sales. Italy is going to sell out its cultural heritage."

The article referred to the Tremonti Decree with "Urgent provisions for the privatization and exploitation of public property and real estate development investment funds", which are still today the fundamental regulations for the dismissal of public assets. In conclusion, the journalist Ute Diehl commented: "Today the cultural heritage of Italy has been degraded to a mere economic value, as a resource that can be discarded at will. However, there is nothing that gives the measure of the state of health of a society as the relationships it is able to have with its monuments and its own landscape".[1]

Taking a stand with his 2002 book "Italy S.p.A., The assault on cultural heritage", Salvatore Settis explained that "What is being destroyed is neither the Coliseum nor a castle in Aosta, nor the Parco degli Abruzzi nor the smallest and most beautiful church in Tuscany, but a much larger monument, even more significant (because it is the safety of all others): the age-old culture of conservation developed by the Italians over generations, on an institutional level and in terms of social conscience".[2]

The desired institutional consideration and reversal of the trend, unfortunately, has not arrived, nor have investments been made in education in order to make citizens understand, and in particular young people, that the landscape, coast, mountains, cities with their churches and palaces, constitute our identity, our consciousness, our soul, and that commodifying them would mean selling ourselves, an identity built by generations of Italians who were the first in the world to create a culture of conservation that is now at risk of disappearing.

The results have not been slow to emerge, involving the most famous and valuable monuments: to give just one example, the area of the excavations of Pompeii, the most famous archaeological site in the world, a UNESCO World Heritage Site, has been hit by a series of collapses and upheavals, which began in November 6, 2010 with the collapse of the Schola Armaturarum, the gladiator school along Via Abundance, and has continued until today with relatively severe episodes.

Unfortunately, Pompeii is not an isolated case, but is the most emblematic example of the degradation that is eroding many monuments, in the absence of effective planning of interventions and adequate funding.

There seems to be the idea of making a profit from cultural heritage without investing. In an article last year, Sergio Rizzo reported the Court of Auditors' report on the reduction of public funds to artistic and cultural heritage, equal to 0.19% of public expenditure compared to the 0.34% of a few years ago, while the French state invested a budget five times higher than ours and Germany had increased its expenditure by 7%. [3]

In the same article, data from the Court of Auditors were also reported about the size of the Italian cultural heritage, amounting to 3,430 museums, 216 archaeological sites, 10,000 churches, 1,500 monasteries, 40,000 castles, towers and fortresses, 30,000 historic houses, 4,000 gardens, and 1,000 historical centres. It also drew attention to the responsibility of Italy compared to the rest of the world, as the guardian of the greatest number of assets protected by UNESCO: 45 out of 911.

A cultural heritage of this magnitude, widespread throughout the country and in addition to a natural heritage and landscape of great variety and beauty, is a special case within a global context, and as such, should be understood and protected with appropriate solutions. It seems that this heritage is mostly seen as a burden, to be freed of at the earliest opportunity by selling it off and with the only advantages being for the private buyer.

It is clear that the Italian heritage needs to be adequately managed, even if it may not be easy. In Italy, there is no sense in trying to apply the American model of sponsorship to isolated "emergency" cases as attractors of tourist and consumer flows: our museums, churches, works of art, are incardinated into the territory, the landscape and the city, being essential elements of continuity, not severable and not to be understood outside of their context. This was fully understood by the Italian legislators of the past. From the edicts of the pre-unification states to the Constitution of the Italian Republic, up to Law 1089 of 1939 on the "Protection of the things of artistic and historical interest", it is possible to recognise the respect of two guiding principles that have now seem to be forgotten: the public artistic heritage is property of citizens as holders of popular sovereignty, and the State has a duty to protect the cultural heritage in its entirety, promoting knowledge through research.

The American museum-centric model, characterised by strongly attractive collections completely unrelated to the context of the host, is absolutely misleading and inapplicable to the Italian context.

Unfortunately, life in capitalist society in general has become a build-up of shows, and culture is no exception, as claimed by Mario Vargas Llosa in a paper recently published entitled "The civilization of the show". The contents of literature, music and art are oversimplifying: everything has to entertain and amuse; artists do not have to justify their talent through their own works, but by becoming shows themselves; museums have to attract throngs of conformist admirers through major events, when "The number is not the quality. Culture was never justified statistically". [4]

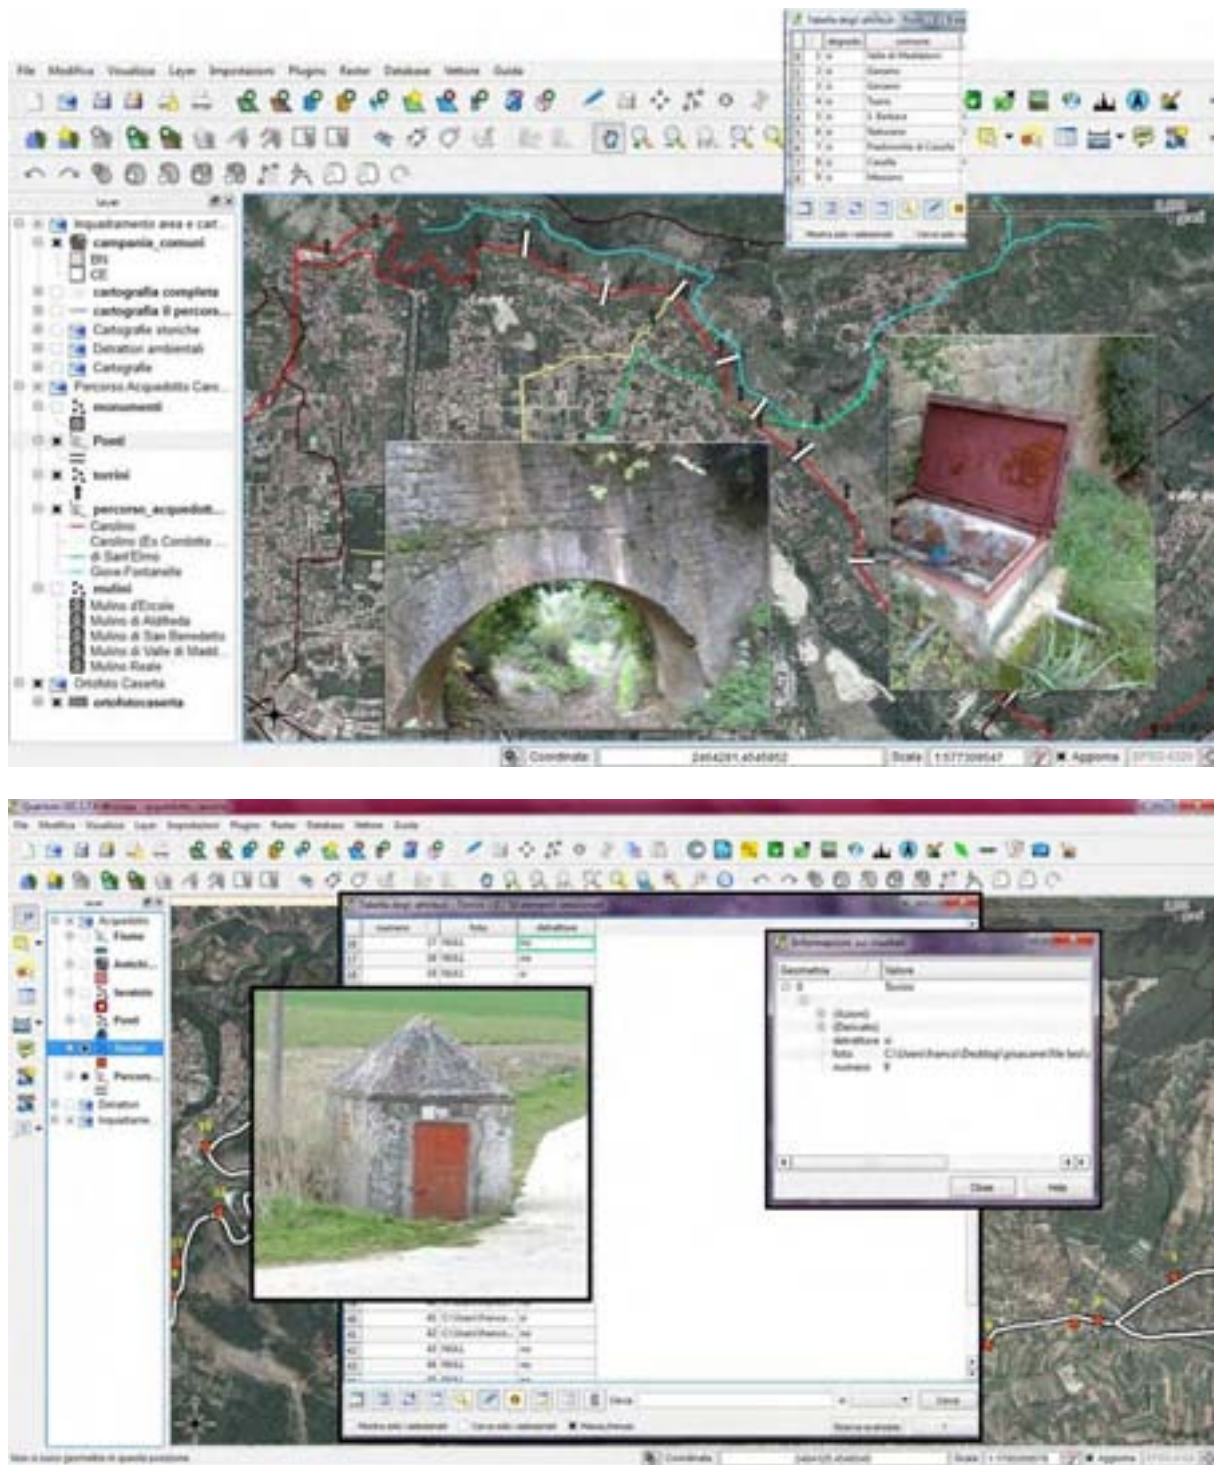

Fig. 2-3: Geographic Information System: analysis of the bridges (fig. 2) and the towers (fig.3).

In our country, the cultural heritage, both inside and outside museums, must be considered as a unicum (whole), within which it is a mistake to focus on ephemeral and spectacular events rather than on the knowledge and protection of the heritage itself as a structural and permanent objective.

The idea of spectacularising culture is ruining the symbol of Italian art cities such as Florence and Venice, reduced to tourist fetishes, money making machines, a sort of amusement park or shopping centre in which citizens have lost the spaces of their everyday lives.

This is what emerges from the words of Tommaso Montanari in "A Manifesto for our heritage", in which he reiterates the civil and constitutional function of heritage, which must be maintained with public money, but is the property of every citizen. "The Italian historical and artistic heritage is coextensive and fused with the environment and must be protected, understood and communicated in its organic and continuous aspects. It is unacceptable for any cultural policy that focuses on so-called "absolute" masterpieces (i.e., literally, "freed" from any network of signifiers), to explant and force them

into exhibition routes with a cognitive value of zero. In other words, the events in Italy are killing monuments and, therefore, there is a need for a drastic change of direction. The vast majority of ancient art exhibitions are also marketing operations which exploit the works, ignore research and promote a passive reception based on the television model". [5]

The same issue had been raised by Settis for whom "The concept of the exhibition as a tourist trap is not only culturally backward, but is a short-sighted economic calculation, likely to cause sudden ignitions of interest and increase in visits, followed by desert and silence [...] The only exhibitions encouraged should be those aimed not at the ephemeral but the permanent, opportunities for knowledge which lead to a reassessment of the lesser known parts of the heritage, and therefore forms of winning investment (in money and energy)". [6]

Against the mis-education produced by the dominant models, the only way out is to start from the educational role of art, culture and the landscape. Heritage is like school: it is a powerful tool for citizenship education and spiritual upliftment. It cannot be considered a luxury or entertainment, and especially not with an ultimate goal of producing an income.

Any consideration of privatization, hiring, contract management or disposal, gives citizens a distorted view of the assets as a "cultural bed", like Italian oil, to be extracted and put to use.

The same is true for the landscape, systematically destroyed for profit, with a short-sighted perspective that does not take into account the enormous damage arising from the hydrogeological instability that subsequently entails, in addition to the loss of environments in which national identity is no less reflected than in cultural heritage. Also in this case, the defence of the environment and landscape includes ethical values, the civil and social associated with them, to contribute to building a better future.

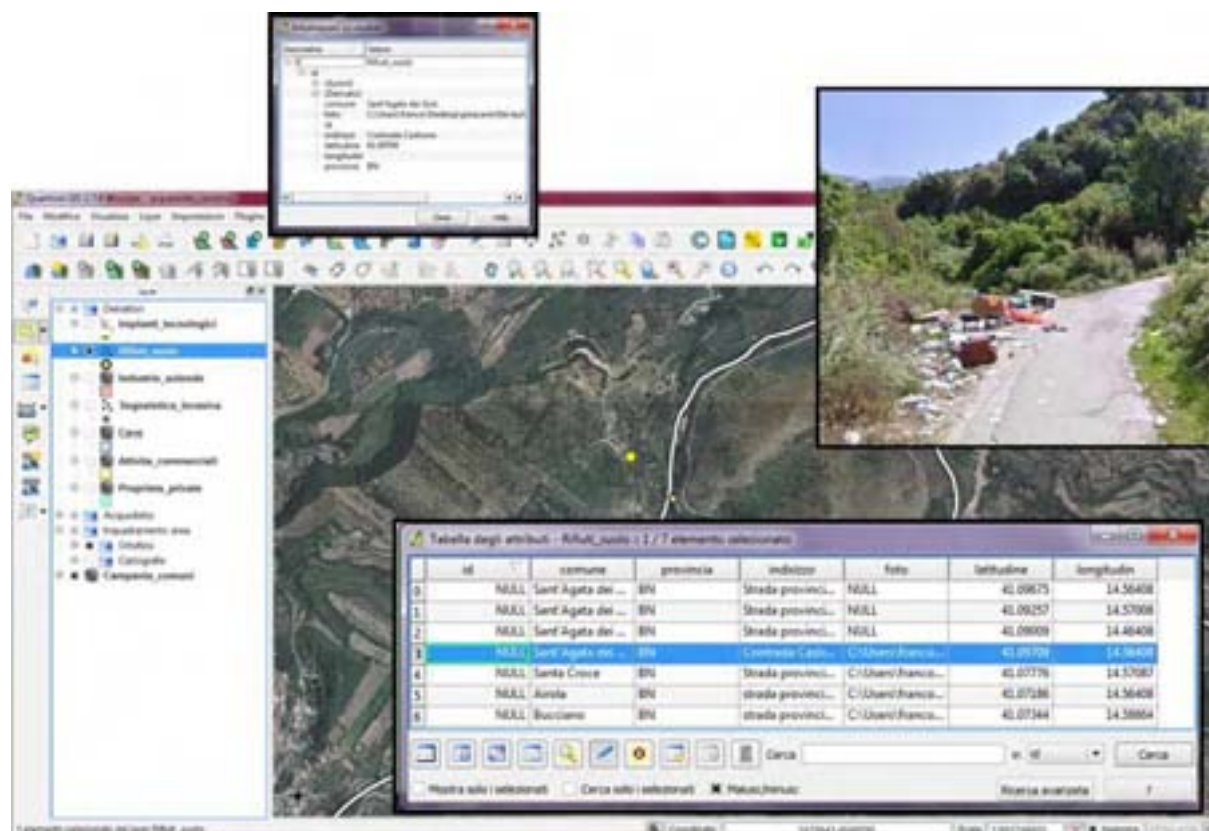

Fig. 4: Geographic Information System: survey on waste.

Starting from education means counteracting widespread figurative illiteracy, making the art, history and culture of the country, which are essential for full conscience of the nation to which one belongs, known and loved by children and young people within the Italian education system.

Young people, when at school, must be the first and most important recipients of the initiatives related to cultural heritage and landscape, in order to be able to understand the national identity understood as a connective tissue which includes monuments, language, literature, theatre, music and so on. The

investments made in this direction would certainly pay off in terms of wealth for the country itself, as is always the case for any investment in human capital, which should never be cut in times of crisis. The museums, instead of investing in ephemeral events, should be seen as places of research and education, to develop, in cooperation with other research institutions, strategies of knowledge and access to their heritage, differentiated by specialists, for the general public as well as for the younger members of society.

Regarding the role of specialists, who must be professionals with technical and cultural skills, or in other words art historians, archaeologists, architects and restorers, and in addition, they should have a civic and institutional sense that only education can give. One of the roles of universities today is to form young people from both a moral and intellectual point of view as well as a technical and professional one, so that they can act with due sensitivity in this area.

University also has a key role in research, assuming that the acquisition and dissemination of knowledge is a worthwhile investment for the protection (i.e. to preserve the value of assets) but also to increase its value through proper communication activities.

Also in this case, research should be specifically addressed to the peculiarities of Italian heritage. It has been said how this is a unique connective tissue. It is therefore important to create a network, a sort of virtual museum of the territory, in which the relationships between the artefacts stored in museums, the other works in the area, villas, churches, monuments, and so on are highlighted. The aim is to broaden knowledge and hence the widespread interest in the assets, creating alternative itineraries to major attractors, allowing less well-known sites to enter the virtuous circle of knowledge.

Fig. 5: Management Plan of the UNESCO site "Royal Palace of the eighteenth century in Caserta with the Park, the Aqueduct of Vanvitelli and the complex of S. Leucio. " Path surveyed by platform Topcon IP-S2 Mobile Mapping installed on a dedicated vehicle.

Fig. 6-7: Images captured by platform Topcon IP-S2 Mobile Mapping installed on a dedicated vehicle.

As stated by Settis, in his recent “Landscape. Constitution. Cement” when he wrote that “museums and monuments, so as not to die, must converse with the city and the world that surrounds them, re-positioning themselves through knowledge and communication mechanisms suitable to the times. To start from the museum, it must be an essential urban node that is grafted onto the heritage, civil and social fabric of the city, the distillation and showcase of the historical sedimentation and collective memory”. [7]

The network would have a key role in reconnecting the works to their tissue of belonging and reuniting lost contexts or geographically dispersed collections, for a better understanding of the work, the artist and the cultural context that produced it. Technology makes it possible to multiply indefinitely the connections, as well as display the logical, chronological, stylistic, geographical, genetic relationships

Thus, knowledge becomes alive, attractive, accessible. The route is not approved and imposed onto the visitor as exhibitions-event, but it is in progress, in the sense that it depends on the relationships that individual users prefer to view, creating their own specific cognitive approach.

To conclude with the words of Montanari, “We have to fight so that the historic fabric of our cities returns to being the instrument of cultural growth guaranteed by the Constitution, and escape the choice between destruction and transformation into an entertainment theme park”.

NOLI ME TANGERE – ON TOUCH

Monika BOGDANOWSKA

Department of Drawing, Painting and Sculpture, Faculty of Architecture, Krakow University of Technology, Kraków, Poland

mimero@interia.pl

Abstract

This paper discusses the issue of physical interaction with monuments. John Ruskin suggested that “...we have no right whatsoever to touch them...”. At the same time, Violet le Duc took the opposite position, encouraging contemporaries to enter into creative interactions with relics of the past. During the hundred and fifty years this controversy remains a classic issue. At the beginning of the 21st century we face new quandaries as a result of our ‘traditional reality’ gradually migrating into ‘virtual space’. Do we still need physical interaction with authentic historic items during the current era, given that our perceptions can be so readily deceived? The human need for creativity and experience may be satisfied by digital tools, which are created and exist in the ‘virtual world’ – away from physical reality. Perhaps this is the ideal moment to discuss such dilemmas, since we have the benefit of more than a century of informed discussion and an urgent need to understand our presence in the context of the modern world, before change overwhelms our understanding of the past. Shifts in attitude towards Neo-Gothic structures are illustrated through examples from Kraków and Oxford, plans to demolish urban heritage in Vienna, Chester and Liverpool and through commercialisation of prehistoric artifacts in the Lascaux cave system.

Keywords: theory of conservation, heritage, conservation philosophy

Introduction

Impatiens noli tangere is the Latin name of the ‘touch-me-not’, a common herbaceous plant often found in damp places. When touched, its pods explode seeds and the life of the flower reaches its end – hence the name.

In “The Lamp of Memory” John Ruskin wrote about monuments: ‘...They are not ours. They belong partly to those who built them and partly to all the generations of mankind who are to follow us. The dead have still their right in them...’ [8]. Both the dead, that is and our successors, but not us. What sense did this interdiction have? Is it still relevant today?

We are a generation experiencing the end of an era: we have witnessed the collapse of the free-market myth, together with the pyramid built upon faith in unceasing economic growth. This is the end of a two-hundred-year era of industrial revolution based on fossil fuels and the relentless conquest of the Earth. Some say that we are heading towards a global environmental disaster. As a civilization, we still have huge potential but surprisingly few ideas how to put it to good use. We are the first generation who will bequeath future generations a world covered in waste, polluted by radioactive leaks, with a disturbed and genetically modified ecosystem. It is a great paradox of our production-governed times that, leaving heaps of indestructible waste, we are not in the least focused on durability! Our knowledge, experience and even art are ephemeral; we record it onto non-durable media which require complex technology to be decoded – the recordings are not even resistant to cosmic radiation. How far are they removed from works carved in stone, created with the use of lengthy and complex technological processes? It is all mind-boggling and difficult to comprehend. Obviously, also for us – art restorers and preservationists, the time has come to make some crucial reassessments.

As history suggests, each period poses new challenges for conservation-restoration. However, this does not mean that old principles are no longer used; it means that nothing gets accepted once and for all and principles undergo verification, sometimes in a very painful way, as a result of dramatic events. This does not necessarily mean that old principles should be discarded, thus: how should the Ruskinian 'do not touch' mantra be understood today? Times and the world have changed and new technologies have appeared. In the context of more than one hundred years of experience, this appeal sounds like a warning, like a directive coming from the past. Can it inspire us, in whose hands lies the duty to preserve what we inherited from the previous generations and the choice of what we should pass on to those who will follow?

It can be concluded, rather perversely, that even *no* intervention is *some* kind of intervention in fact; for leaving an object to itself means agreeing to it being transformed – destroyed by natural processes. However, this is not what Ruskin meant. He simply opposed any material interaction with the historic fabric, because he wanted it to be preserved with all secondary additions brought on by the passing of time. But let us look at those whom Ruskin denied the right to touch. During his era, conservation of architecture was synonymous with rebuilding and renovation; archaeological sites were freely dug through and irreversibly damaged and discovered artefacts went to supply private collections. Coats of varnish and overpainting were brutally removed from paintings, frescos were experimentally transferred. Those were times when methods of structural consolidation or hydrophobization were still unknown; times when Violet le-Duc, a self-appointed constructor of Gothic cathedrals, raged on the Continent. In a phrase: those were entirely different times.

To be honest, however, it seems that no one ever did take the Ruskinian principle literally. His appeal was a reaction to a specific situation and it sprang from his exceptional sensitivity. Ruskin was a person – if I may put it this way – who was deeply aware of the essence of what he was looking at. A mind incapable of reflection, which looks without seeing and listens without hearing, will fail to perceive the hidden values of the surrounding world. A visible sign of Ruskinian insight is Venice, which he discovered for his contemporaries, even though at that time most travel guides suggested it was best to steer clear of the city.

'Not to touch' is perhaps the most difficult task for a restorer, for how can one resist touching when it is so easily possible? In its classical definition, art conservation excludes passivity – it is an action whose aim is to preserve, protect from damage and deterioration. Even 'preventive restoration', whose aim, as defined by Brandi, is to bring back the artefact's value into a recipient's consciousness, not necessarily involving any direct interaction with the artefact, is an action [1]. According to every definition that has ever functioned, the restorer's task is to maintain the life of an object and take care to preserve its fabric and meaning. So we preserve the fabric, the substance of the work, and take care of its artistic form and its meaning by documenting it.

As I mentioned above, each new era poses new and surprising challenges to restorers. The period of Romanticism, of searching for national identities, was a time when relics of the past were cherished, collected and contemplated. Collecting passions gave rise to scientific research and development of new branches of knowledge: archaeology, conservation and art history. A dilemma unavoidably appeared - how should one deal with historic artefacts? What should be done to preserve their state, restore their greatness and reveal their exceptional features? The nineteenth-century instances of restoration sprang from the needs of that society and while they did contribute to increasing interest in monuments and more generally in historic artefacts, the scale of damage they caused must have made those sympathetic to Ruskin's view cry out: *Noli tangere!*

Then, just when it seemed that the principles of handling relics of the past, as formulated by Riegel and developed by Dvořák, would remain unchanged, the two world wars brought out the necessity to verify them. The complete reconstruction of destroyed built heritage became not only acceptable, but simply necessary. The object's existence in a specific, historically documented form became more important than its authenticity. The trauma of war damage showed how addicted we had become to matter, how submissive we were towards the primacy of historic fabric. It took a major re-evaluation of the former way of thinking for the decision to be taken to rebuild the Old Town in Warsaw, which meant to reinstate the *genius loci* of the destroyed capital using entirely new materials, while not being entirely faithful to the original form.

The second half of the 20th century, with the economic prosperity of the West and the poverty of the East, brought new challenges. After years of estimating losses and rebuilding destroyed historic cities, in

the ruins of which millions of artefacts of lesser and greater importance and of different periods got lost, there appeared a new slogan – *modernity*. This slogan, inscribed on banners displayed by proponents of 'progress', became a challenge to the past and, although it was not entirely clear then, to historic artefacts and buildings. It is surprising that the power of this word circumvented the barrier of the Iron Curtain and despite the economic differences between the East and West, the process of destroying cultural heritage proceeded in a similar fashion simultaneously on both sides. The need to break away from the aesthetics of the old and the destroyed was overpowering. In Poland, some objects carried the additional burden of the Partitions; being branded as work created by invaders, while others, in turn, were seen as exposing the backwardness of the Polish countryside vernacular. There was absolutely no place for them in the modern Socialist reality.

And so, the 1960s irreversibly changed the appearance of many European cities. For example, in Liverpool during 1966, the city council earmarked for demolition *seventy-eight thousand* buildings which made up the core of the residential area in the city centre. Derek Latham commented of that time: "Councils seemed to vie with each other to complete destruction of their built heritage, encouraged by government and supported by architects and planners, who presented watercolour images of a sunlit concrete world peopled with brightly painted figures living under a blue sky" [6].

Mario Schwarz and Manfred Wehdorn, discussing one hundred instances of restoration of historic town buildings in Vienna, recall the danger which loomed over many of them in the 1960s and 1970s, giving the example of Spittelberg, a street which was planned to be entirely razed to the ground [9].

On our Cracovian ground, an excellent illustration of those changes is the discussion about the leading Neo Gothic building in Cracow – the Jagiellonian University, Collegium Novum. This is probably the most important building of Cracovian Historicism. The modern seat of the oldest Polish university, the edifice was erected between 1882 and 1887, mainly using funds drawn from the Austro-Hungarian invaders thanks to the cunning of University professors. The building was designed with passion; every detail was discussed by a circle of professors, eminent architects and historians of art and the main idea held by the building committee was to introduce as many motifs typical of the Polish Gothic style as possible. At the time it was constructed, it was a synonym of Polishness for the nation living under partition.

Subsequently, in the 1960s, Karol Estreicher, the most eminent Cracovian historian of art at that time, publicly voiced an opinion that the Neo Gothic style in Cracow was first and foremost a tool of Germanisation. This was a very strong argument, especially if we take into account the fact that it was voiced only 20 years after the war. What is more, Estreicher not only criticized the architectural design, but also questioned the knowledge of art historians participating in the project, calling them flatly dilettantes. In his article, Estreicher writes: "The most important work by Księżarski, which up to this day is regarded as his original architectural creation, that is the Collegium Novum of the Jagiellonian University, is – simply put – an instance of architectural plagiarism. It has to be said once and for all for the sake of truth. Księżarski reproduced here, from the outside, the Kreuzgymnasium in Dresden (...), and from the inside, in the staircase, the vaults of the Teutonic Castle in Malbork" [3].

The opinions voiced by Estreicher affected not only the architectural value of the Collegium Novum, but the value of Neo Gothic architecture in general, although obviously one cannot put the whole blame on Estreicher. He was, in colloquial terms, "a child of his times," involved in a common trend contesting Historicism and Art Nouveau. Even though one might have expected that the war experience and commonly accepted principles of conservation-restoration would have been an effective antidote which protected historic buildings from devastation, the objects erected at the end of the 19th century were not under protection; they were eagerly adapted and their furnishings were thoughtlessly destroyed.

At almost exactly the same time in Oxford, a dramatic decision was taken to dismantle the Oxford University Museum of Natural History – an architectural masterpiece, co-created, paradoxically, by John Ruskin. This magnificent building, which masterfully resolved the dilemma of constructing a modern structure on the basis of historical patterns, which displayed ingenious solutions concerning the interiors and through which Ruskin could actually bring to life his conceptions concerning granting creative freedom to simple workers – this magnificent edifice was to be pulled down to make way for a modern concrete structure. The *opus magnum* of the nineteenth century architecture of Oxford ceased to be attractive, which was borne out by the words of T.S.R. Boase, the English counterpart of Estreicher: "The museum has never been widely admired" [7].

Obviously, the heritage protection millieux did not stay put. In 1962 in France, the *Loi Malraux* was formulated: it was the first directive which expressed the need not only to protect, but also to revitalize historic sites as a whole [10]. Another document was the *Venice Charter*, whose entire fourteenth chapter

was devoted to this subject; it was the first to take into account the inextricable connection between an object and its context, thus making Max Dvorak's conceptions legally valid. The Charter also emphasized artistic and cultural values displayed by "humble objects". In Polish circles, the Venice Charter was supported by the Warsaw-Nairobi Recommendation.

The 1970s carried a whiff of a breakthrough. Several phenomena contributed to this fact. First and foremost, there appeared the so-called 'best preserver' – the money shortage caused by the recession during the second half of the 1970s. Due to the economic slump in Western countries, demolitions were suspended, which rescued, for example, the market square in Chester – one of the more valuable medieval cities in Britain, even though the rest of the city was unrecognizably transformed. The 1970s also brought an important cultural breakthrough, mistakenly perceived only to be 'rebellious youth' and the associated rise of new musical forms. However, it was the 'Flower Children's' generation who appreciated the history of civilization and culture and by searching for Romantic references in the past, they changed the approach to historic artefacts. The year 1975, hailed as the European Architectural Heritage Year, turned out to be crucial for European art restoration. Many initiatives and organizations were launched and the first entries appeared in the UNESCO World Heritage List. The following years further widened the scale of protection, whose range was then defined in the Washington Charter of 1987. Apart from historic architectural assemblies, the natural, archaeological and social aspects were noted, thus making cultural landscape the object of heritage protection.

The rehabilitation of the Neo Gothic style did not happen until the 1980s, when the first art history sessions devoted to art of the second half of the 19th century were held. It was during this period that Collegium Novum was finally accepted as one of the peak achievements of the Polish Neo-Gothic. Shortage of money also rescued the Oxford University Museum of Natural History, although part of the assembly, i.e. the curator's house, was demolished.

It is difficult to estimate the scale of damage done across Europe as a result of earlier aversions. Today, we can freely call it 'a holocaust of cultural landscape'. Under the excuse of 'progress' and modernity, not only thousands of buildings, but also their furnishings were destroyed. Amongst the Neo-Gothic furniture of Collegium Novum only that of the assembly hall remains; the rest was burned. No one appreciated the splendid artefacts of pre-war craftsmanship: tiled stoves, wooden staircases, old chandeliers, wrought iron bars, stuccos, or window woodwork. The arrival of the entry-phone led to the loss of decorative door handles. Changes came, as they still are coming – the world is in a state of flux, under permanent reconstruction...

Noli tangere. Today we, the next generation, are crying and lamenting the damage done by our predecessors to artefacts which, according to Ruskin, did not belong to them. Our fathers only inherited them from their fathers. If only they had listened to Ruskin – the historic centres of European cities would look very different today. Wooden and military architecture, so mercilessly demolished in Poland, would have survived.

And what about today? Let us have a look at the most recent years which preceded the end of the neoliberal economic boom and left us in the dramatic present-day situation. In the 1980s profit expectations were transferred from money-markets to production efficiency, which resulted in the lowering of employment costs through automation and consequently the rise of mass-produced items. This process caused massive social changes: traditional craftsmanship declined and mass production began to oust local products. Ruskin's anticipations became reality: the creator turned into a consumer.

With mass production there naturally appeared a mass culture. The roots of this culture can be traced to the process of cultural globalization. It is assumed to be remote from local creativeness, hence locally created objects are alien to it, although they may be attractive – but only as products. That is why, at one point, marketing specialists suggested we refer to monuments as 'tourist products' and those whose interest should be awoken – the 'target'. Thus, heritage became subject to economic estimation. Today, nobody speaks of memorial or historical values anymore; the historic artefact has been given a new *material* value. It had to be so, since every historical period tends to perceive the world 'through its own glasses'. Who is going to spend money on protecting something of an intimate unspecified sentimental value? Ours are different times. Since the material value is part of the value of a historic artefact, its merits will be considered in the context of it being 'a worthy investment', and consequently worth protecting. This breeds tension between restorers and users, for the values for which we protect historic artefacts are not always saleable. On the other hand, searching for consensus is necessary if we truly want to save our heritage.

Is there still a place in contemporary culture for objects which are deeply rooted in native tradition and landscape, but fall short of economic challenges? Where in this globalized reality is there room for historic artefacts? What is the restorer's place?

A possible answer to these questions may be found in the case of the mosaic on the façade of the Cracovian Biprostal building. A magnificent abstract 600-square-metre decoration, on the wall of the only high-rise building erected in Cracow in the 1960s, was to be torn down during thermal modernization in 2010. Information about this appeared on social networks and was quickly picked up by the media. The proponents for its destruction put forward the following arguments: the owner is allowed to do anything to the building, the economic aspects of using the building are more important than the mosaic and insulating the walls would lower the running costs. Why should the building be protected when it is not even a monument? and, last but not least, the mosaic is "hideous" – even if some people like it, it is devoid of any value. It is worth noting that none of the arguments quoted above belongs to the realm of art, culture, restoration or heritage protection. They all belong to a world driven by the logic of the free-market and consumption. The conviction that the mosaic is not a monument springs from a belief that a monument must be a listed object protected by the law. Moreover, a contemporary perspective conforms to the idea that a monument should be "pretty". Unlike their 19th century predecessors, who may have appreciated the charm of ruins, for example, the materialists fail to reflect upon the passing of time. In turn, the proponents for keeping the mosaic intact emphasized its uniqueness as well as its perfect integration with the building for which it had been designed. (It should be noted that such ceramic decorations, popular in the postwar period, were almost all destroyed during the last two decades). Eventually, social pressure and numerous protests, along with letters and appeals to conservation-restoration authorities rescued the mosaic, since it is one of the very few left in Cracow. *Noli tangere*. After all, it didn't belong to us!

The above example shows that we cannot discuss cultural heritage protection using the language of economics. This language is suitable for planning a budget, or concluding a credit agreement, but not for heritage protection. In the same way, nobody will discuss the intangible value of goods within the field of banking.

The best illustration of the change in approach towards cultural heritage during the 20th century are perhaps illustrated by two prehistoric painting galleries: the caves in Lascaux and Chauvet. The Lascaux system of caves, discovered in 1940, was quickly opened to visitors and became a major tourist attraction, bringing economic revival to the region and attracting thousands of visitors. With time, it became evident that such intensive intrusion distorted the caves' delicate microclimate, leading to an invasion of microorganisms which is causing problems to this day. We now know that re-establishing the climatic balance inside the cave through air conditioning is impossible. The cave contains a complex ecosystem and functions like a living organism. Letting people enter it irreversibly distorted that balance. The Chauvet cave was discovered half a century later in the 1990s and was immediately sealed. The assembly of paintings discovered inside is nearly twice as old as those in Lascaux. It is possible to enter only with a consent from the French Ministry of Culture for research purposes and only for a few hours a year, with a small group of people. Werner Herzog's four-member team were allowed only three hours to shoot material for the film: *'Cave of Forgotten Dreams'*. It was recorded in 3D and gives one a feeling of being inside the cave – even of experiencing the almost physical presence of the prehistoric painters. No tourists. No crowds, stalls or shops – the cave is closed. The stone walls and steel doors protect its unsalable values. The paintings in Chauvet are not to be touched.

Ironically, it is during our extremely materialistic and consumerist era that tools have been created which allow us to protect historic artefacts without touching them. We have the power to restore an object, make it readable to contemporary tastes – as Brandi desired – using no treatment at all. A damaged original can be placed safely in a repository. An art restorer can apply virtual treatments to it: remove yellowed varnish, reconstruct it and then invite visitors to view it in a virtual gallery. Given that even now we can take virtual walks, soon we will likely be able to experience an almost real-life full-sensory experience of visiting, for example, the Acropolis from any geographical location. Will this possibility heighten or diminish the rank of this place, which for many today is little more than another 'must-see' on a trip itinerary, unreal in the sense that it is usually filled with crowds of perspiring and disinterested tourists?

Let us put these futuristic visions aside. If there is one important lesson to be taken from the experience of the past then it is that we are unable to foresee what will happen next, what needs will arise, what principles and expectations will appear. Our task is to protect heritage from thoughtless destruction and to persuade people that even if they cannot respect the works of past generations, at least they should grant their successors freedom of choice. In the face of looming cultural homogenisation, it is art restorers who

will lay claim to objects belonging to different periods and cultures. It will be a new and important challenge for them, for they will no longer fight for individual masterpieces, but for the very embodiment of the cultural richness of the past.

Looking back at the damage done during the 20th century, we may arrive at the conclusion that the erroneous thinking lay in ascribing specific values to cultural objects and in the continuous assessment of whether they were of value and what exactly that value and the rank of the objects were. It happened regardless of whether the highest value was perceived as historic, as it was in the past, or material, as it is today. A generation will perceive particular values in a particular way and future generations will formulate their own perceptions anew. However, is it possible to protect historic artefacts without ascribing *any* value to them? Yes, if we think like Ruskin did: "They do not belong to us." They just *are* and the only thing we should do is pass them on to our successors. We can interpret them, use them as a source of knowledge or aesthetic experience – they may even evoke anger or repulsion in us – but we have no right to destroy them simply because we fail to notice in them values that we currently deem significant. Not touching, then, will be an indicator of the highest form of respect, not only to an artwork itself, but also to previous and future generations.

Conclusion

Noli me tangere are the words with which resurrected Christ addresses Mary Magdalene, who is the first person to meet Him outside His tomb. "Touch me not," or, "Don't hold me." The words that follow sound very mysterious: "Touch me not; for I am not yet ascended to the Father" [11]. Thus: "Do not touch" so as not to disturb an ongoing process.

What significance do these considerations have for us as people of the 21st century? Perhaps, before touching, it is worth asking, "What is the point of touching?" Maybe this question should be asked more often today. Perhaps sometimes it will help us verify our attitude towards an artefact and do what for the art restorer is the most difficult thing to do – accept the state of the work and the process it is in; agree to its untouched state and in this way, paradoxically, step out of time, in that very moment. *Noli tangere* tells us – do not touch, instead, look, see or think, or as a philosopher would put it: Just rest within your being, if by some curious coincidence you have been given this experience.

A new cultural landscape: the Historic District of Zhong Shan

Livio SACCHI

Department of Architecture, Università degli Studi "G. d'Annunzio", Chieti – Pescara

livio.sacchi@archiworld.it

Abstract

An agreement between three Italian schools of Architecture - the School of Architecture of the Università degli Studi "G. d'Annunzio" di Chieti Pescara, the School of Architecture of the Università degli Studi di Camerino in Ascoli Piceno and the IUAV, Istituto Universitario di Architettura di Venezia - the Zhong Shan Design Institute and the Municipality of Zhong Shan, has recently made possible a new Master Plan for the Historic District of the Chinese city of Zhong Shan. As a whole, considering the relationships that, originally, linked the Jiu Qu river (natural) to the (man-made) built environment, the District is a complex cultural landscape, a combined work of nature and men, its urban space being the product of different generations. The most interesting built examples date back to the so called Golden Age - the Twenties and Thirties of the 20th Century - when the merchants of the Guangdong region opened themselves to a new global attitude, successfully conquering the foreign markets. Many of these buildings, all of them accurately surveyed and laser scanned, date back to that period. Our design proposal aims at the conservation of the urban diversity; the rediscovery of the now underground river; the transformation of this valued, though run down, area into a lively and attractive one for Chinese and foreign tourists; at making it a significant part of China's *green* leap forward; at conserving and showcasing its peculiar southern Chinese cultural identity.

Keywords: China, Zhong Shan, Guangdong, heritage, laser scanner surveys

1. *Architectural history and the future of the city*

The architectural history of a city and its cultural heritage is among the priceless and irreplaceable assets, not only of Zhongshan and of China, but of humanity as a whole. The loss, through deterioration or disappearance, of any of these most prized assets constitute an impoverishment of the heritage of all the peoples of the world. Since the adoption of the UNESCO Convention in 1972, the protection and conservation of the cultural heritage constitute a significant contribution to a sustainable development. Based on the principles of the 1964 International Charter on Conservation and Restoration of Monuments and Sites (the so called Venice Charter), our specific duty is the identification, protection, conservation, presentation and transmission to the future generations of a cultural heritage of outstanding universal value, promoting the application of theory, methodology and scientific techniques to this valued, Chinese urban area.

The Historic District of the city of Zhongshan is made of different parts and of quite different buildings; most of them, because of their history, their architectural qualities, their typology, their building materials, their decorative apparatus, their homogeneity and the social and relational qualities of the public spaces, can certainly be considered of "outstanding value" from the point of view of history as well as art. As a whole, and considering the very interesting relationships that originally linked the river (natural) to the (man-made) built environment, the complex may even be considered as a true cultural landscape, a "combined work of nature and of men" and its urban space considered the product of the creative genius of different generations. "Outstanding value" means a cultural significance which is so exceptional as to transcend local (Guangdong) or national (Chinese) boundaries and to be of common importance for the present and the future generations of humanity. Nowadays, local Administration is

Fig. 1: Figure caption

demonstrating its full commitment - in the forms of appropriate policy, legal, scientific, technical, administrative and financial measures adopted and proposed - to restore and protect this urban complex and its great value: we are willing to cooperate with our specific scientific culture and technical know-how and with the experience made in decades of field studies on similar Italian and foreign urban complexes, well as art.

Fig. 2: Figure caption

As a whole, and considering the very interesting relationships that originally linked the river (natural) to the (man-made) built environment, the complex may even be considered as a true cultural landscape, a “combined work of nature and of men” and its urban space considered the product of the creative genius of different generations. “Outstanding value” means a cultural significance which is so exceptional as to transcend local (Guangdong) or national (Chinese) boundaries and to be of common importance for the present and the future generations of humanity.

Nowadays, local Administration is demonstrating its full commitment - in the forms of appropriate policy, legal, scientific, technical, administrative and financial measures adopted and proposed - to restore and protect this urban complex and its great value: we are willing to cooperate with our specific scientific culture and technical know-how and with the experience made in decades of field studies on similar Italian and foreign urban complexes.

The central part of the city represents an interesting example of the Southern Chinese urban and architectural creativity; it bears a significant testimony to a very specific cultural tradition and to a living civilization; it is also a very peculiar mix of different building types, an architectural ensemble which illustrates a significant stage in the city's history; quite a few areas of the Historic District, though partly spoiled by recent buildings of debatable quality, meet the conditions of integrity and authenticity (authenticity is expressed through a variety of attributes including: form and design, materials and substance, use and function, traditions and techniques, location and setting). It is also very important to note that the entire area is very lively and densely populated, if not as attractive, for tourists as well for the inhabitants of “modern” Zhongshan, as it should be.

The most interesting built examples date back to the so called Golden Age, a period that can be located in the Twenties and the Thirties of the 20th Century, when the many merchants of Zhongshan opened themselves to a new global attitude and successfully conquered the foreign markets. Many of the most interesting historic buildings, that have been accurately studied and surveyed, date back to that period. The rediscovery of the identity of Zhongshan is clearly linked to the rediscovery of this anonymously, but competently and also stylishly designed and built architectural heritage and of its original, now unfortunately lost, relationship with the underground river. We and our Chinese colleagues share the opinion that the city has to look back at its memories if it wishes to come to a fresh start for a brilliant future.

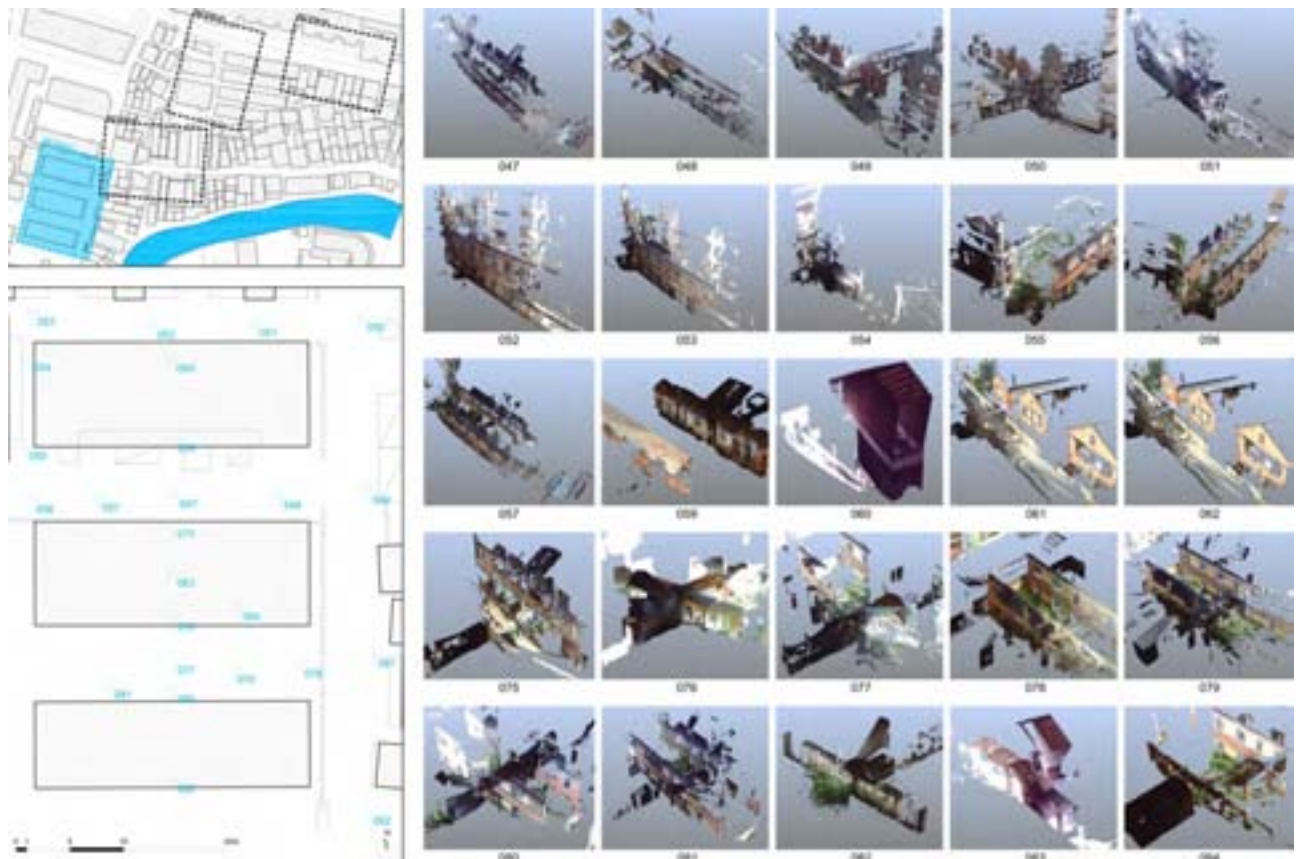

Fig. 3: Figure caption

Our project will aim at the conservation of the entire Historic District, prolonging the life and the integrity of its architectural characters, its built forms, its constituent materials, its original colors, its once strict relationship with the Jiu Qu river. In the mainframe of our proposal, we shall distinguish diverse interventions such as preservation, rehabilitation and restoration.

Fig. 4: Figure caption

Preservation emphasizes the retention of all historic fabric through conservation, maintenance and repair. It reflects a building's continuum over time, through successive occupancies, and the respectful changes and alterations that were and are made. It is a very important stage: preserving is better and cheaper than restoring and accurate and competent maintenance is essential for the healthy survival of our built heritage.

Fig. 5: Figure caption

Rehabilitation emphasizes the retention and repair of historic materials, with some latitude for replacement and reconstruction of the deteriorated or missing parts. The upgrading of the historic standards to contemporary ones is a necessity: nobody wishes to live now as our grandparents lived in the past. This is true in terms of size of the rooms, in terms of natural light and ventilation, in terms of service areas such as bathrooms and kitchens etc. But properly upgraded historic buildings can be more efficient and can provide a more comfortable, contemporary living than many recently built ones.

Restoration focuses on the retention of materials from the most significant time in the city's history, while permitting the removal of materials from other periods. It is the most delicate part of the intervention and it has to be executed by highly skilled craftsmen under the supervision of experienced scholars and professionals.

A subtle cultural sensibility and a deep critical know-how are evidently requested in order to correctly read and interpret the built architectural and urban heritage. Italian architectural and urban culture has possibly been the most actively and widely interested in interventions on the built heritage all over the world. As it is the case for China, Italy has been continuously inhabited since very ancient times; its historic cities are universally recognized among the most valuable western urban models of humankind; the quality of life that the historic central districts of some of our cities can boast is rated at the highest ranks in the world urban competition. Italian experts, though sometimes overcome by the quantity and the artistic quality of their extraordinary built heritage, have usually been very successful in preserving and restoring historic towns and as a whole.

The result of all this is that, though post war Italian suburbs share the same problems (and ugliness) of many other contemporary cultures all around the world, its historic urban legacy is still nowadays very successful among its citizens and extremely appreciated and looked after by tourists. It's understood that the built heritage should not be considered a heavy burden on the municipal finances, but an exciting opportunity to exploit – not without a high degree of cultural sensibility - for the future of the entire local community.

Fig. 6: Figure caption

2. Section *Architectural history and the future of the city*

The Historic District in central Zhongshan also has to become a significant part of China's *green* leap forward. Our current way of life, here as anywhere else, is clearly unsustainable, and that which is not sustainable does not continue. Our cities have to rely on renewable resources, they must be dramatically more ecologically sustainable and we have the challenging task to redesign them in order to achieve an entirely different kind of civilization.

Fig. 7: Figure caption

A green city can have a great, positive impact on the planet's future. Cities have to grow smart and old historic districts, if properly upgraded, can be way smarter than most recently built suburbs. The idea

of a green city can coexist perfectly well within an historic district. A well redesigned historic district won't just help comfortable people become prosperous, it will also meet its inhabitants most basic needs – from clean water and adequate housing to education, healthcare and other social services – better than spread out, car dependant suburbs do. Designers (architects, engineers, urban planners, technicians etc.) have to know the place well in order to make it better, because a given urban-planning tool never works for every city, and because the more we know and love a place, the more we want to participate in determining its evolution. This is the reason why the Italian architects and planners involved in this design proposal must strictly cooperate with their Chinese colleagues in order to share an exciting, common vision for the future of Zhongshan.

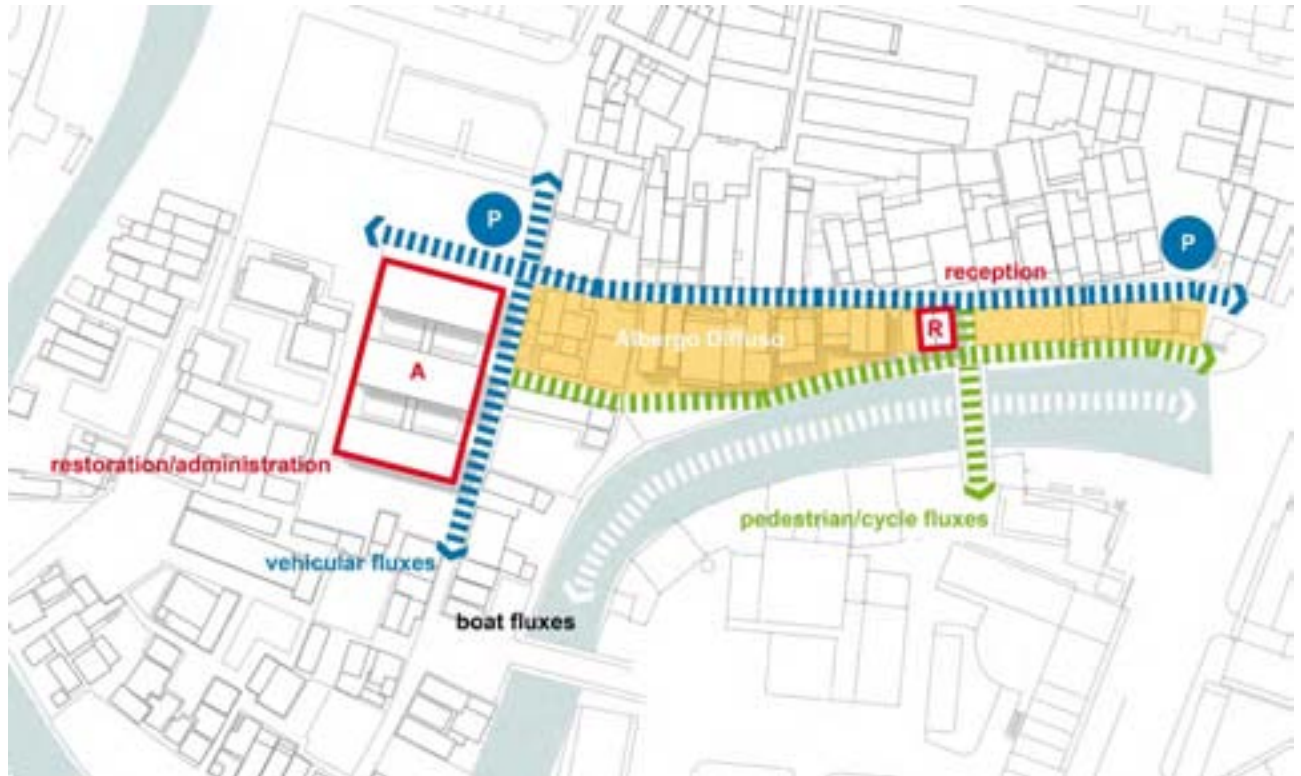

Fig. 8: Figure caption

Central Zhongshan will thus experiment a great variety of challenging and entirely new issues, like, for example, new forms of urban farming: people will be able to produce a significant percentage of their food using their small gardens, their terraces and green roofs and the public, green areas along their newly discovered river. The linear park along the Jiu Qu river will also preserve biodiversity in the midst of a densely populated urban environment. This park and other green areas, with their abundance of shade trees, will act as passive means of cooling, blocking hot sun rays from the houses. Achieving a high density - which is very much part of the Chinese as much as Italian urban traditions - is extremely important for achieving a more general urban efficiency: though contradictory, a dense compact neighborhood use less energy and spew less pollution. People can walk or bike, and everything gets cheaper and easier to provide: electricity, sewage and other basic services. And when more people share these services, they all have far less of an impact on the city and on the planet. We all know that we have to build in existing communities – it's the so-called *infill* housing – in order to have comparatively minimal impact on surrounding ecosystems, since the most damage has already been done there. Zhongshan, as any other contemporary metropolis, has to fight hard, avoid the urban sprawl and increase the quality of its urban life: improving air and water quality, creating vibrant and friendly neighborhoods and becoming a walkable city, at least in its central areas.

The new houses that will be built there and the old existing houses that will be competently and creatively renovated, will adopt solar panels to bring clean energy and refrigeration in the humid season and will make good use of the rainwater that falls on the roofs; passive solar energy will also make use of existing conditions and natural methods like conduction and radiation to heat the water; discarded hardwood coming for existing buildings that have to be demolished can be reused in new constructions; a ReBuilding Center will hopefully be opened in order to provide a vast selection of readily available material coming from these previously discarded buildings. The renovated houses, properly designed *ad hoc*, will be more flexible, adaptable and interactive than the old ones; smart

home technologies, for example, can easily be proposed in the renovated Historic District; geothermal pumps may also be adopted in order to achieve a natural cooling of the indoor temperatures: these and other similar design strategies, will produce homes that act not only as a passive shelter, but as an efficient, active service system, keeping up with its inhabitants' demands for a comfortable and convenient space; in the end they will prove ecofriendly but also wallet friendly.

Fig. 9: Figure caption

Housing must be dedicated to a range of incomes and mixed with offices, shops and a wealth of beautifully designed, low maintenance green spaces: parks, community gardens and playgrounds. Everything will be on a human scale to make pedestrians, elderly, disabled and children feel welcome. We have to make walking not only easy but pleasurable. Shopping areas and public transit must be within a five-minute walk of every home. Public transit (also on the river), walking and bicycle use, under the right circumstances and with appropriate long-term public policies, can serve as viable alternatives to reliance on the automobile. We have to discourage car ownership and invest in making public transportation safe, cheap and reliable. We have to protect key views of the river and of the many historic buildings that dot the area and introduce green roofs, rain gardens and green facades in order to reduce the heat-island effect, decrease ground-level ozone and limit the demand for AC. At the urban scale, for example, permeable pavements will be used in order to preserve all the functionality of regular pavement eliminating the downsides: they will allow rainwater to filter through into the ground, preventing street flooding and keeping urban greenery healthier, with less work and less water. Effective water technologies must obviously become a very important part of our design proposal: the homes of this neighborhood will be part of a natural system, considering the pivotal role played by the river in the new Master Plan.

Fig. 10: Figure caption

In the end, the Historic District will become a very interesting and lively area, crossed by the Jiu Qu river and highlighted by a variety of historic buildings that form a rich urban pattern, clearly different and easily recognizable from the more recent parts of the city. A mix of residential, educational and commercial buildings will also include showrooms, ateliers, galleries, exhibition halls, offices, boutiques, craftsmen shops, little hotels etc.: the result will be an exciting and creative neighborhood, very attractive for the locals (especially for young people) and their activities, but also open to the international trends and influxes, in a very similar way to what can be found in many successful and tourist oriented Italian historic towns. But, most of all, we must never forget the importance of carefully keeping the precious, cultural identity of the place, of its architectural and functional characters, in a more general attitude aiming at showcasing the traditional southern Chinese culture. The chosen methodology will be the same that has been used in similar projects by Italian architects in Italy and elsewhere, aiming at the conservation of urban diversity (in terms of building types, materials and functions), an extremely difficult quality to achieve in new interventions; the strengthening of civic pride (people must feel that they are part of a vibrant and deeply rooted community, that they are citizens and not city-users); the creation of a sustainable environment (the buildings should produce more energy than they request etc.); and - last, but not least - at the transformation of the Historic District into a very attractive and deeply rewarding area for Chinese and foreign tourists.

The Historic District of Zhong Shan has been surveyed and redesigned by professor Livio Sacchi with architect Luigi Valentino Losciale, Ph.D., architect Alessia Maiolatesi, Ph.D. and architect Sergio Di Tondo, Ph.D; the group is part of the Research Unit of the Department of Architecture of the Università degli Studi "G. d'Annunzio" di Chieti - Pescara.

Disclosure of historic and cultural potential and proposals for restoration of the castles of Western Ukraine

Jawdat GOUSSOUS¹, Galina TOTOVITSKAYA²

⁽¹⁾Department of architecture , University of Jordan, Amman, Jordan

E-mailjawdatgoussous@hotmail.com

⁽²⁾Chief architect of VERES co. Kiev, Ukraine

tot-g1@bigmir.net

Abstract

In 1989, Professor Nikolai Bevez (Lvov Polytechnic Institute) noted that the number of castles in Ukraine and their quality of architecture, showed a potential for it to become a leading European centre for heritage in this field.

In Ukraine, there are presently about a hundred castles. Due to scarcity of funding, there is a pressing need to halt the natural destruction of these castles, which are an integral part of the landscape of Ukraine, and assess the prospects for a sustainable restoration program that would contribute significantly to the national image and boost tourism revenue.

Due to geographical and historical factors, the majority of the castles are located in the west of the country.

Therefore, this Article focuses on castles in the Transcarpathian region, presenting an analysis of the current state of conservation of these monuments, the disclosure of historical and cultural potential, and possible reconstruction projects of some of these castle complexes.

Keywords: castles, restoration, architecture, monuments, style

Introduction:

All cultural monuments that are located in Ukraine are inviolable national property that presents scientific, historical and artistic value.

In Ukraine (income from tourism is 3.3 billion dollars) a year. For comparison, in Germany the figure is 80 billion dollars per year.

Historical and cultural objects in particular, are not valued as tourism resources, most of the sights are not entered in the tourist routes, which leads to their restricted use. All of this affects domestic tourism business; with proper advertising it can provide significant economic and social benefit.

Many monasteries in Ukraine as centers of pilgrimage, palace and park ensembles, castles and other historical and cultural monuments, are rarely used with a cognitive purpose and are out of the active tourist process in Ukraine.

The purpose of the article:

1. Introduce the audience to the early settlements and Carpathian foothills of Western Ukraine.

Particularly castles were the centers of life, future cities and settlements were built around them.

2. Typical plans for construction of fortifications in 14-17 century in Ukraine.

The layout configuration of castles was based on elevation contours, where the fortifications were built.

All castles were surrounded by a deep moat and an earth mold.

3. Example of luxury hunting lodge castles built in the style of French castles of Louis 14th - Schonborn castle in Berehvar district.

4. Example of reconstruction of castle ruins - creating historical and landscape park in its place.

Ukrainian castles mostly date from XIV - XVII centuries. We want to pay special attention to Carpathian and Transcarpathian castles, for two reasons: they are the closest to the European countries / easier to resolve travel issues / and the picturesque location at the foothills of the Carpathian Mountains.

Mostly, first castles were built of wood, then - of stone and brick. Since they were constructed for defensive purposes, most common for them was to be located on rocks, hills and river banks. Castles were peculiar life centers with settlements forming around them.

In total, there are 12 Transcarpathian castles. Most castles are under destruction, and from some there is no trace, however each of them is worthy of attention because these structures played a significant role in the life of Ukrainian lands and were associated with well-known families, individuals, and have left their mark in history of Ukraine.

Special attention needs be given to 4 castles of Carpathian region that have unusual popularity among tourists.

Nevytsky castle is considered to be the oldest in Ukraine reflecting defense architecture of XIII century. **Nevytsky castle** was founded in 12-13 century.

The uniqueness of castle is that it has an authentic style of architecture which is unique in Europe. However at present, you would rather call it romantic ruins than a castle, which are also magnificent and unique. The ruins of Nevytsky castle are located on a picturesque hill above the valley of the river Uzh. Stone castle in place of the wooden fortress was erected in the XIII century. Its plan determines the shape of the upper terrace of the mountain - close to oval. Along the defensive wall two-story buildings were placed forming a narrow castle courtyard with galleries, which was close to the parameters 35*12 m. Most of the fortified castle buildings were square in plan; the four-story tower dungeon is located in the south-east side of the building. Entrance gate was apparently locked from the south of the courtyard. The castle was surrounded by a deep moat and an earth mold.

All of this you can see in the plan of the castle below.

Unfortunately at this time **Nevytsky castle** is in the process of destruction and it's a pity that the castle is destroyed not only by time but also by people. They break the walls, draw pictures and throw trash around. Some of the buildings are in critical condition, so they are closed to the mass visit.

Uzhhorod castle

Uzhhorod castle — historical heart of Uzhhorod and Carpathia. The castle was built in middle ages by Drugeth family, and then rebuilt several times, now it is open as a museum.

The castle is located on a high hill of volcanic origin that hovers over river Uzh. Stone building was built in the XIII century on the site of ancient Kyiv Rus settlement of IX-XIII centuries. During the XIII - the first half of the XVI century castle repeatedly withstood the siege - it was destroyed and rebuilt. At the end of the XVI century the castle was rebuilt under supervision of the Italian masters with the latest achievements of fortification art of that time.

Uzhhorod castle - a masterpiece of Romanesque architectural style. The main building of the castle was the palace, additionally protected from the south-eastern and north-eastern side by the low wall of the bridge, which was built across the moat and drove to the northern palace entry.

Architectural structures of the castle at this stage are in good condition, which cannot be said about the landscape. Earlier, castle was surrounded by lush gardens, among which was the flower garden, recalling French parks. Restoration of the park - this is the main task of the reconstruction of **Uzhhorod castle**.

Shenborn castle.

The same thing should be noted about Schonborn castle, to emphasize the greatness and beauty of the building by landscape design that meets the requirements of that era. Castle of counts Schonborn is an elegant hunting palace located in Beregvar district, which is 10 km from Mukachevo.

Romantic view of the French castles of Louis XIV era is given to the building by an eclectic architecture dominated by Gothic and Renaissance elements. Astronomical year was taken as the basis of the project: 365 windows correspond to the number of days in the year, 52 rooms meet the number of weeks, and 12 entrances - the number of months. The building is decorated with numerous turrets, weather vanes, colorful tiles, stained glass, heraldic molding. Family crest with lion and a crown of Shenborn can be seen on the clock tower. Interior is partially preserved with a grand staircase and a fireplace. The palace is located in the heart of the English park with area of 19 hectares, with the natural landscape, of rare breeds of trees and shrubs: Boxwood, Cherry, Weymouth pine, Canadian spruce. Outline of the park pond resembles the map of Austria-Hungary. Each fall, nobles across Europe came to Schonborn hunting grounds for hunting and leisure.

Since 1946, clinical sanatorium "Karpaty" was open in the area of the estate, where they treat cardiovascular disease. There is a well-room with a unique mineral water "Polyana Fonts."

See the photo:

Pic.11 Clinical sanatorium "Karpaty"

Castle Palanok in Mukachevo is most visited castle by tourists. **Mukachevo castle** - is an example of medieval fortification architecture, which combines different styles. **Mukachevo castle** is located on a volcanic mountain with height of 68 m. and covers the area of about 14 sq. m². The castle consists of three parts and is placed on three terraces. The oldest - Upper Castle of XIV-XVI centuries is located on top of the mountain, the Middle of XVII century - on the terrace 6 m. below and the Lower Castle also of XVII century - 10m. below the Middle. At the beginning of the XVIII century, on the fourth terrace 10 m. lower, the tower was built for the protection of the gate and road to the castle on the western slope of the mountain. This road is preserved to this day, and the tower was destroyed in the early XX century, leaving only its foundation.

Each part of the castle is surrounded by stone walls 3-3.5 m. thick, dry moats with depth of 10-12 m., where they used to place lifting wooden bridges. The castle was under protection of 8 powerful bastions adjoined in XVII century on the corners of all three parts of the castle, where the artillery was placed. Gateway to the Lower Castle, where the guards were located, was protected by two powerful circular bastions. Middle Castle had four bastions, a large courtyard surrounded by a two-storey building, which housed the barracks for the garrison, an arsenal, knights' hall, kitchen, barns. On the north side of the yard once stood the house of the commandant, which was demolished in the second half of the XX century, leaving only the foundation. Behind Middle castle there are stone walls of the Upper Castle of XIV century, on which you can climb by the stairs from left and right. On the left - stairs of the square tower of the late XV century. On the right - the so-called "walking-trap", cut out by the south-east tower at the end of the XVI century.

Upper Castle - former residence of its owner, has the yard closed on all sides, two-three storey buildings - the luxury apartments of the former duke of XVI-XVII centuries. Three round towers of XIV century, completed in XVII century, the castle chapel of XVII century. On the north side of the Upper Castle there are two defensive bastions. In the southern part of the courtyard is a well with the depth of 85 meters, the water of which was used until the end of the XIX century (from Austrian sources XIX of century). In the well, at a depth of 71 m. there were two stone cut spiral staircases, which ended at 1.6 m. from the bottom niches. The first stairs were in the south, the second - in the north. According to legend, at the bottom of a well there was a secret underground passage to the shore of Latoritsa. Around the castle mountain in the XVI century, was a cut water moat, which was filled with water from the river Latoritsa. Later, in the XVII century, moat was fortified with oak palisade - Palanca. That is why the castle is called - **Palanok Castle**.

At this time, the castle is in good condition. The flow of tourists is probably the biggest compared to other castles of Transcarpathia. This is one of reasons why the souvenir shops are located inside the castle.

This shows to be a minus, because medieval structure loses its beauty and that is why there is a needed to remove all trading points inside the castle. Special area near the castle can be assigned for this purpose, where souvenir shops could be built along with food facilities. Otherwise, shops and cafes can be placed in the internal structure of the castle, so that they would not affect the architectural beauty.

Majestic and beautiful are also the castles of Ivano-Frankovsk region. To be clear with the specification, they are more considered to be ruins than castles. There are totally 5 castles in Ivano-Frankovsk region, though one of them could hardly be called a castle due to its tasteless reconstruction – **Rojnyatovsky Castle/Scarbak castle**.

Four castles in Carpathia take part in a contest «7 wonders of Ukraine: castles, fortresses, palaces». These include: **Starostinsky Castle** Halych city), **Pnivsky Castle** of 16-19 century (Pniv village of Nadvirnyanskogo district), **Chernelitsky Castle** of XVII century (Chernelitsa city), **Rakovetsky castle** of XVII century (city Rakovets, Rogatyn region).

Halych castle

It is worth noting **Starostinsky castle** in Halich, which can be called a model for transforming ruins of the castle in the place of interest for tourists. The project design for restoration of the complex has been already made, see the photo.

Wooden structure was first mentioned in 1144. Subsequently, strong citadel was turned into a castle of Halych dukes. There are allegations that it had a two-story basement.

Halych castle or they also call it Starostinsky castle, was constructed in 1367, during polish feudalism. The castle is located near Dnestr River near the dock of Halych. By one of the versions it was built by Volyn governor Lubart, in place of ancient Kiev Rus citadel, which stood on the site in the days of Daniel Galitsky. Until the fifteenth century the castle was one of the largest in Halych, the area of the castle-seven thousand square meters; the garrison consisted of one thousand men.

During XVI -XVII centuries, the castle was repeatedly attacked by Turks and Tatars, and only in 1649 it was retaken by the troops of Khmelnytsky. At first it was a wooden structure, which already, in 1658 by the orders of elder Count Andrei Galitsky Potocki (founder of Stanislav city) was turned to stone by the project of Italian engineer fortifier F. Korassini.

Citadel area of 1.7 ha was triangular in shape and consisted of two parts, one above the other. The towers were tetrahedral and pentagon. The castle had an underground storage of ammunition, food and arsenal. Moreover, the fortress was surrounded by two lines of defense. In good shape remain Shlahetskaya tower and the chapel of St. Catherine, which was part of the defense system.

Now the castle is a part of the National Park of Ancient Halych. There are also plans to open the exhibition of ancient weapons.

At present, from the castle of the end of XVI century remain the ruins of pentagon corner tower (west) at the second level and what is left of the defense walls with loopholes. Numerous basements still remain in the castle.

Not less romantic are the ruins of Chernelitsky castle built in the 17th century. It is characterized by the architectural style of Renaissance.

The remains of the castle are located on a right rocky bank of the Dniester River. The castle was built in the early XVII century, however, during Polish-Cossack battles its construction was in deterrence. It was completed in 1659, by Duke George-Michael Chartoriysky, governor of Bratslav. It was a bastion fortification, square in plan, with four bastions and two story gate tower with side porches along the western wall of defense. Its walls were six meters in height with up to two meters in thickness. A palace was standing out in complex of castle structures, which was repeatedly visited by Jan Sobieski II during his Moldovan campaigns in 1685-1691. When Duke Chartoriysky was involved in military actions, he left the castle to his wife - beautiful dark-haired Duchess Frosini Chartoriysky. Hence, by the legend is the name - **Chernelitsky castle** and settlement Chernelitsya.

After the loss of the function of the defense castle it was used as premises. Its owners were Galecki, Potocki, Stanitskie and other noblemen. Starting from XIX century castle gradually began to decline.

At present there are only ruins of the gate tower and parts of the structures of western defense walls. Including, white stone arch portal access gates, made in plastic Renaissance architectural style. Above it, imbedded in the wall, is the carved crest "Race".

Pnivsky Castle is located in Ivano-Frankovsk region, near Nadvirnynsk city. It is extremely interesting and valuable sight of military-defense architecture. The foundation of the castle - the second half of the XVI century. **Pnivsky Castle** - is one of the southern defense outposts of Halych lands of XVI - XVII century.

Pnivsky castle is located on high hill of Carpathian foothills. It was built in the second half of the XVI century by local landowners Kuropatvy. Regular layout configuration is determined by features of the **castle** area. Almost pentagon, it was formed with two story walls of 1.7 meters thick and with five corner two story towers. Out of these, south and south-east were round the northern and south-west - hexagon, and between them at the turn of the north-west wall is a semicircular tower with the built in rectangular house.

On the opposite side of the yard, along the south-eastern wall of defense, was a three-story palace, with and adjacent triangular tower behind the line of walls. The gate tower housing and half-bridge over the moat were on the axis of the southern wall. Now remain the ruins of defense walls, the remains of the foundations of the palace, and towers with loopholes at a level of the second floor. And now foundation is the only trace of the southern round corner tower.

Pnivsky Castle - a large, well-planned and well thought-fortification. It was the largest in Carpathians before the construction of Stanislav stronghold (1662). The castle is located on a natural hill, turned to the western side of the river Bistrica Nadvernyanskaya .

Number of towers of the castle stepped out over the general line of the walls, which allowed having a good view and a shot around the castle walls. The last, fifth tower was the entry. The entrance to the castle was through a lifting bridge over the special moat that was filled with water. Moat was artificial and it stretched along the south wall of the castle. On the eastern side the castle defenses were strengthened by a deep gill, with the small river flowing at the bottom. In the west, castle stands on a natural hill with a cliff. The most vulnerable and unprotected part of the castle was on the north side, nevertheless, during that time it was one of the most fortified and equipped places for a long siege in entire Ukraine. Strength of the walls of the castle was repeatedly tested during the past centuries.

Northern wall survived the most, without losing its integrity and original height, and without any traces of more recent works. It even has the part of the original material of plaster. Traces of the original appearance of the walls have also survived on the round tower, which connects the northern and eastern walls of the castle. This was a high tower and had several floors. Overlaps between the floors were made of wood. Inside the tower is a special place to fasten the woodblocks. There are still remains of them inside. In relatively good shape is the eastern tower. It is laid out not only of stone, but of red brick that was used for reconstruction. The eastern wall gives a clear idea of the difference in the ground levels of the castle and the surrounding area: the outer walls are more than double in height than the internal, and this forms the idea of the existence of underground system hidden beneath the castle. This was also proved by the numerous entrances leading down beneath the floor. Eastern wall has windows with bay overlaps made of stone beams. You can see cornice stepping out above the windows. Other walls and towers are in much worse condition, having cracks or being completely dispersed. Window bays and entrances to the inner yard were made by dome technique. Walls of the castle and especially towers have a large number of channels cut into the thick masonry, through them came out the smoke. This was a heating system in middle ages. The availability of these channels, as well as plaster and windows shows that from the moment of its appearance castle complex was planned and built not only as a fortification, but was also used as a place to live in.

Living quarters also existed in the entrance tower, which were located on the second floor. The tower itself is in heavily damaged condition, but the arch gates survived. On the facade of the tower entrance remains a niche for bridge and hoist chains. Castle was famous for numerous underground passages, which also greatly increased its defense, especially at the time of siege.

Underground entrances of square tower survived the most. How many were there, and which way they were leading - it is difficult to say now. However, one of them led to another citadel of round stone tower.

Pnivsky Castle

Pnivsky castle, which is now picturesque ruins of the walls and some towers, in the 15th century, was an inaccessible stronghold. Historians claim that the castle was captured by the enemy only once. And the defeat was not due to the weakness of its defenders but because of betrayal.

Here, in this historical site every year is the festival "Dzhendzhur Fist." One of the purposes of the festival is to raise funds for the restoration of the **Pnivsky castle**. Every year this festival is becoming very popular not only among the Ukrainians, but also among foreign visitors. So that the recovery, at least in part, is the initial target.

Another tragic story is associated with **Pnivsky castle** - execution of Jews during World War II. By the words of eyewitnesses there were about 3,000 people executed. The entire wall near the place of tragedy is riddled with small holes from bullets. It is near the wall we want to place a memorial to the victims of fascism.

Skarbek castle

In comparison with the previous castles, where they stood on the edge of settlements, **Skarbek castle** is located in the center of the small town Rozhnyatov. It was constructed in the fifteenth century. The castle was well fortified and surrounded by a deep moat, and had two loopholes. At this time, earthworks and loopholes are completely destroyed. It is even impossible to tell where they were because of the building near the castle.

Two underground passages led into the woods, to Baturin and Basilian Monastery district (now "Podmonastyr"). Construction of the castle is associated with the name of Count Skarbka. Skarbka together with Potocky, Yablonovsky, Koniiecpolsky were the richest Halych lords. It used to serve as fortification till XVII century. The name of the owner of the castle was Stanislaw Skarbek and it is related with reconstruction of the building. He made it a hunting lodge, added European refinement in the interior, making it an apartment for his residence. Neo-Gothic architectural style of the castle became clearly defined. A beautiful pond lies at the foot of the tower. To the great regret, it was covered with earth in Soviet times.

Along with this, Skarbek built the first blast furnace in Angelova Rozhnyatovskogo area, where they found the iron ore. He also built a church in that area. It was he, who invited John Pinzel. Later he was called Ukrainian Michelangelo to make sculptures for the church. There were 12 apostles skillfully carved out of wood, but after a fire, only three survived. His castle, he connected with the church by underground passage.

The present appearance of the castle remains on paintings and old photos.

After that date, papers will not be considerate for oral presentation and publication.

Abstract

This paper is inspired by the Erasmus Intensive Program "Architecture of Modernism in the Seaside Resorts of Bulgaria, Romania, Turkey and Italy" that will involve the authors' Faculties, and other European Universities, in the organization of plein-air workshops and student competitions concerning cultural heritage and the architecture of the coastal areas, starting at Varna Free University in 2014. The program sets a task to rediscover any lost examples of modern architecture, and preserved ones too, which are to be documented and mapped, as well as to propose measures for exhibiting them in various forms of architectural-and-artistic lighting, revealing the specific characteristics and qualities of the sites.

The aim of this paper is to provide a preliminary documentation about examples of modern architecture in costal areas of Italy and Bulgary, that will successively be integrated with examples from the other involved Countries. The documentation has the objective of verifying the presence of a common language in the different European coasts, both regarding the architectural language and the relation between architecture and landscape.

The documentation includes the conservation conditions of the architectures of major interest, in order to propose common solutions for the knowledge, preservation and touristic valorization of an important cultural heritage. It is also analyzed the representation at the time of such architectures, and the new communication language generated by the will to promote coastal resorts.

Keywords: Documentation, cultural heritage, architecture of modernism, costal landscape.

1. Introduction

In the 1930s, the ideas of modern architecture were gaining an increasing popularity. The seaside resorts proved to be among the places in Europe where principles such as openness to the natural environment, the ease of the solutions, the use of flat roofs, terraces, and large balconies found their natural implementation. Therefore, modern architecture was spreading along the European coastal areas at same time with their development and promotion of mass-scale leisure activities.

Often these architectures show an interesting integration with the landscape, obtained by the sliding glass doors, the use of patios and outdoor living spaces, a large expanses of glass, courtyards, horizontal orientation and integration of natural landscape features into design, use of natural materials.

Architecture, in varied innovative forms, became an essential ingredient in fashioning the seaside. Designed to entice people seeking leisure and pleasure, architecture became an important characteristic distinguishing one seaside place from another. [1] It can be considered as a cultural artefact, evolving over the time through a process of cultural design.

It has been argued that from the mid-nineteen century, the visual sense was increasingly hegemonic in the relationship with the nature, including the sea, that has been transformed into a visual spectacle. The fundamental process of tourist consummation became capturing the gaze, and seaside resorts became the tool for such experience. [2]

The architecture of the seaside is the product of a cultural design process: architecture and its representation generated a series of meanings that influenced the relation between people and seaside. This cultural design involves the representation of the seaside and its architecture in visual images, promotional materials such as guidebooks, publicity posters, postcards and photographs. These representation influenced the way in which seaside architectures and resorts have been viewed and used. That's why it is important to document at the same time the architectures and the new communication language used for tourism representation at the time, presenting similar characteristics in all geographical areas.

2. The Italian coast in XX century. Tourism, architecture and representation (M.P.)

The "tourism success" of Italy, at least until the seventeenth century, was due to the image of advanced and creative urban society. During the eighteenth century, the cultural point of view took minor interest. Tourists began to appreciate the beauty and power of nature, so that the Enlightenment led to the discovery of the sea, while the romanticism preferred the mountain. [3]

The first example of "modern tourism" was the thermal tourism. Was born in Britain at the end of the seventeenth century and registered the greatest development between the mid-eighteenth and early nineteenth century.

Even the discovery of the sea as a tourist destination belongs to English aristocracy in the second half of the eighteenth century, when they began attending the first seaside resorts, the success of which depended on the ability to manage the free time of vacationers and by the investments made. In fact, people rarely used to bath: they walked on the beach conversing and protecting from the sun with umbrellas, as the sun was not recognized to have any therapeutic function. [4]

It was only in late nineteenth century that the "culture of the sun" revolutionized the map of seaside tourism and seasons. The coasts of Mediterranean, already highly attractive for winter tourism, began hosting a growing number of tourists even during the hottest months of the year, competing with the cold seashores of the North Sea. Consequently, tourism on the Italian coast had a rapid expansion during the twentieth century. [5]

2.1 The origins of seaside tourism and the Liberty architecture

The development of resorts in the Mediterranean area began in France and Spain, then spread to Greece, Italy, Yugoslavia, and after that, to north Africa and Turkey.

Surpassed the travel style of the *Grand Tour*, during the twentieth century, the Italian coast had two phases of development: the first - at the beginning of the century - was still exclusive prerogative of aristocracy and upper middle class, and is testified by the presence of numerous Liberty villas and hotels, original examples of architecture during the golden age known worldwide as the "Belle Epoque". [6]

The most characteristic architecture, at the beginnings of seaside tourism, is represented by the architectural formula of the *kursaal*: literally "treatment room", a name that echoes the connotation of the therapeutic bathing in the sea at the origins of tourism. It consisted of a large building, which today would be called multifunctional, generally located on the beach and used as an hotel, bathhouse, game room, café-concert, casino. The first to be built was the one of Ostend in 1852, followed by a long series of such facilities spread throughout the continent, that made the word *kursaal* a synonym of tourism and recreation complex serving vacationers and bathers.

Fig. 5: The *Kursaal* in Rimini, built in the late nineteenth century in neoclassical style by Gaetano Urbani, and demolished in the postwar period.

The encounter between the new demands of seaside tourism and the new architectural taste, gave rise to modern buildings intended to satisfy the dream dimension of the architecture intended for recreation and leisure. [7]

In Italy, this phase of development of the seaside town took place in correspondence of the Art Deco period. The fulcrum of the new settlements was the walk next the sea, where the architectures, built in a virgin place like the beach, were laid in line as pavilions, whose stylistic compositions showed different styles and materials, following the international models diffused by the Universal Expositions.

Fig. 6: Villa Zuzzi in Lignano, Italy (1910), one of the oldest Liberty buildings still extant, in a period picture.

2.2 Mass tourism and modern architecture

In the second half of the twentieth century, the seaside summer tourism became the central product of the new mass tourism, which replaced the previous elitist tourist fruition. Tourism became accessible to workers employed, so far excluded from the tourist circuits for economic reasons. It is obviously a turning point, destined to change forever the structure of Western society: its scale of values, its needs, its customs, its paradigms, were transformed. [8]

The term "mass tourism" has not only an economic significance: on the one hand, it refers to the principle of minimizing costs - and thus of the maximization of profit - by offering an undifferentiated product to a mass of buyers as large as possible, while on the other hand it suggests a sociological dimension of belonging to a mass, the mass of vacationers.

People go on holiday for an identity and cultural need, not to feel excluded from their social sphere and to participate in a collective ritual. During this phase, the summer holiday in a beach resort is the most diffused holiday; for Europeans preferably in a Mediterranean resort.

There is thus a transition from the edification of private villas to resort towns, featuring a new concept of urban planning, which included areas reserved for leisure, large squares and sidewalks for walking, and the construction of recreational facilities.

This has led to the explosion of the offer of receptivity, with the construction of hotels, guesthouses, campsites, holiday villages, second homes, and tourist services (restaurants, bathing establishments, shipping), in a growing number of towns having resources related to the sea and the sun. [9]

Between the fifties and seventies of the twentieth century, the localities defined pioneer, that had already been concerned by forms of tourism in the late nineteenth and early twentieth century, such as Viareggio, Grado and Rimini in Italy, set an example for the new locations that were organizing in function of tourism, both in terms of material aspects, such as accommodation, shops and restaurants, beaches, both in terms of intangible aspects, like knowledge and skills of staff in tourist services, management methods, forms of communication and marketing, etc. [10]

The rapid growth of demand has generated a concrete prospects of development for the seaside resorts involved in the seaside tourism, but at the same time has produced an alteration of coastal landscapes often irreversible, and in many cases has introduced a spatial segregation between residents and vacationers. The result is a linear model of urbanization, immediately adjacent and parallel to the coast, where the building for tourism in many cases weighed heavily on landscape and coastal ecosystems. [11]

Apart from the speculations of scarce aesthetic value, it is also possible to find interesting experiments of the new architectural forms that in those years were spreading in Europe.

Many architects worked out projects characterized by the new architectural forms of modernism and rationalism, that just in holiday resorts had their first representative expression. In the most significant examples it can be seen an attention to the relationship between the architecture and the surrounding environment, which is expressed both inserting the shapes in the context, both using large windows to facilitate the relationship between the inside and the external.

Fig. 7: Colonia Marina, Italy, in a postcard of the 60s. The building in modern style was realized in 1939 by Pietro Zanini.

Among the best known examples in Italy, is the *Hotel Parco dei Principi* in Sorrento, designed by Gio Ponti between 1960 and 1961, which can be considered one of the first examples of design hotels in Europe. The architect was inspired by the preexistence for the development of heights, the disposition in plan of the volumes and the visual effect from the garden and the sea; but draw up a project that has all the elements particular to his poetic: the work on surfaces, the linearity and verticality, the "visual eyes", the decoration, the lightness, the landscapes.

Situated on the top of the promontory, the complex appears high and sober, anchored to the rock thanks to the two levels dug into tuff, but soaring up because of the walls that mark the rhythm of the volumes. The white plaster is interrupted only at the openings: air, light and the blue sea come into the rooms, in a continuous exchange between internal and external spaces.

The facades are treated as independent surfaces: one bears the mark of horizontal continuous bands of balconies; another is defined by a checkerboard of small covered loggias and terraces; others are dotted with jutting "tribunes" framed in white, alternating with openings of different sizes and recesses formed in the thickness of the masonry.

In addition to a great care in the design of coverings, Ponti gives precise indications about the type and disposition of the furniture.

The building has recently been concerned by a work of restoration, and represents a symbol of the Sorrento coast, and more generally of Italian design. [12]

Fig. 8: *Hotel Parco dei Principi*, Sorrento, Italy. Designed by Gio Ponti in 1960-61.

2.3 Representation and imaginary

The tourist imaginary strongly influences the choice of destinations. Since the dawn of tourism, a kind of hierarchy of the attractions has been defined. The tourist posters and postcards, that accompanied the birth and transformation of tourism resorts, constitute a precious witness of the evolution of buildings and landscapes, but also of tastes and customs of the public. The images of the past, especially in the photographs and postcards, have in fact also a function of social reflexivity, witness and memory of the society evolution. [13]

In the last decades of the nineteenth and early twentieth century, there was a boom in the production and dissemination of picture postcards with the most varied content. The low cost of shipping, as well as the evocative power of images, allowed a wide use of postcards, especially by the rising social classes of the middle and lower middle class, while initially it were disdained by the aristocracy, and were rarely used by the poorer classes, as was illiterate.

The diffusion of tourism, as well as the scarcity of other communication systems, decreed their success. Their representations document the evolution of the spaces of beach life progressively built up, starting from the bathhouse, to the seafront and villas that will characterize the settlement. [14] Posters and postcards were also an opportunity for graphical and pictorial experiments, especially finalized to advertising, involving in some case the artistic vanguards. The evolution of graphic communication through travel poster is therefore a starting point for interesting researches that should certainly be taken into consideration in the documentation of the development of coastal resorts.

Fig 9: Poster of Grado, Italy, by Auchentaller, artist of the Viennese Secession, 1906.

3. Modernism in Bulgarian coast. Conservation and valorization (M. K.)

After the Stalinist period, architecture in Bulgaria turns much more to modernism, while still has specific "socialist" characteristics, so we call it "the social modernism." There are certain "rules" that sometimes overlap with Western architecture, other times are complementary and sometimes quite different.

At the end of the 60s of the twentieth century, the resort-tourism in the country was developing and beyond the already known resort "Albena", "Golden Sands" and "Sunny Beach". Characteristic of the tourism was the diffusion of departmental holiday homes, especially in smaller communities on the south coast as Primorsko, Sozopol, Tsarevo. It was here that have been preserved more buildings typical of the development of architecture during this period, while in the larger resorts, in the first decade of the 21st, most built in the previous century was destroyed.

Fig. 11-12: 'Perla' near Primorsko.

Today, the cultural heritage of modern architecture is subject to a much greater risk than that in any other time. Even at the end of the 80s it is very overwhelmed and many masterpieces were destroyed or altered beyond recognition. Some of them are not considered as elements of inheritance; over the years their original functions have changed significantly, and technological innovation have not passed the test of time.

On a global scale has born the idea of the physical protection and moral rehabilitation of such heritage, a kind of debt to one of the biggest cultural phenomena of the 20th century. This problem is even more acute in Bulgaria and despite repeated discussions, many objects of modern architecture in the country are not registered as monuments. This topic has not yet been firmly in the curricula of all schools of architecture. Some of the problems are:

- Difficult interpretation of the causes that give rise to problems of architectural heritage; lack of operating principles and evaluation criteria; lack of professional documentation and lack of evaluation of the architecture of modernism.
- Difficult to implement mechanisms to ensure its documentation and to evaluate and create a unified digitized system database.
- Inadequate management of technical methods for protection and regeneration of the architectural heritage of the twentieth century. [15]

The documentation have the aim to rediscover any lost examples of modern architecture, and preserved ones too, which are to be documented and mapped, as well as to propose measures for exhibiting them in one of the most up-to-date solutions – lighting architecture – various forms of architectural-and-artistic lighting, revealing the specific characteristics and qualities of the sites.

Current trends and methods of exposure, keeping the design features (elements) of the buildings and their surrounding areas, such as through the implementation of adequate solutions for light design allows the general appearance of modern architecture to be presented in a new attractive, adapted and adequate lighting vision.

For light sources using advanced lighting systems (LED), which are economical, durable, compact, flexible design and energy efficiency. It also allows to obtain a uniform distribution of light without form dark areas typical of other light sources.

4. Conclusion

The present tourist development have changed as a result of globalization, intended as the progressive growth of relations and exchanges in the world, whose main effects are the economic and cultural convergence between the regions involved. The increasing openness that globalization has generated in the geo-political, economic, and cultural field has decisively influenced the development of contemporary tourism, dilating the territories, and making the tourism one of the main economic sectors in the world.

The reasons of this evolution of the tourist market are of both technological (improved accessibility of a growing number of locations thanks to the development of low-cost transports; wider information available thanks to the Internet), and motivational (search for alternative destinations; desire for encounter with different cultures, identities and atmospheres perceived as genuine; aspiration to expand the sphere of action in new or unusual experiences).

In such a market, the competition between destinations is very strong, and it is important to highlight the characteristics of a place identity, to differentiate it from the others. The documentation of the examples of modern architecture can be the basis for a European network for the enhancement and promotion of a shared cultural heritage with common styles and languages.

Brazilian Parties: the transformation of obligation into fun

Maria Cristina CAPONERO

Department of History and Fundamentals of Architecture and Urbanism of the School of Architecture and Urbanism of the University of São Paulo, São Paulo, Brazil
criscaponero@usp.br

Abstract

This article aims to analyze the transformation that has taken place in Brazil since the colonial period to nowadays, once the constant celebrating has made Brazil known worldwide as "the country of festivities", especially by Carnival. Through analysis of primary and secondary sources, we note that the constant celebrate is not new: since the beginning of colonization the parties punctuate the Brazilian history, especially the religious ones. The dizzying urban transformations suffered in the last decades deleted previous forms of urban social organization: as the colonial city, strongly marked by the mandatory religious parties; the imperial city, which kept some of them, although they have entered into decline; the city under the influence of European aristocratic bias in the First Republic that controlled and laicized many parties and introduced others by the hands of immigrants, especially Italians; the modernist city and the metropolis where some parties persisted among many others that disappeared. Anyway, the city has completely changed its face over the years, clearing customs and overshadowing the traditions. The secularization happened gradually, the urban public space moved from the religious predominance in its beginnings to the secular nowadays. The parties persisted punctuating the course of people's lives, but the mandatory religious festivities are no longer celebrated, they were changing slowly and nowadays they have meaning of leisure and fun for a particular society and at a particular time.

Keywords: Brazilian parties; urban public space; secularization; leisure.

1. Understanding the Brazilian parties in a historical perspective

A long time ago, the constant celebrating has made Brazil known worldwide as "the country of festivities", especially by Carnival. Several parties, especially those of essentially religious Catholic character, have been taking place throughout the years in several Brazilian cities, each one presenting certain specificities, depending on the community in which they are inserted and on the period in question. But, this constant celebrating is not new, since the beginning of colonization, the festivities have been punctuating the history of Brazil, being essential to the organization of the societary tissue and to the Brazilian lifestyle and they also are occupying a privileged place in the building of society and Brazilian culture (PEREZ, w/d, p. 16)^[1].

In order to understand the meaning of the parties and their continuity in the collective life of Brazilian cities, the big challenge is to find in the documents of the past signs of their history. The dizzying urban transformations suffered in the last decades deleted previous forms of urban social organization. The colonial city, with its mud buildings, was demolished from the late 19th century, including many religious buildings related to the early Brazilian religious parties. A new city emerged based on the capitalist and bourgeois logic, under the influence of European aristocratic bias. The policy of the First Republic governments tried to control and to secularize many parties, along with many new ones introduced by the hands of immigrants. In the modernist city and in the metropolis some traditional parties still persisted among many others that disappeared and new ones that arise, now with another different guise and profane values.

Anyway, the city has completely changed its appearance over the centuries in an accelerated process of redesigning of the urban public space, no longer marked by the religious predominance. The population increased, there was a progressive secularization of everyday life and only some

ancient parties persisted, punctuating the course of people's lives, marking the moments and collectivities periodically, expressing and intensifying the collective life and the policies of the public space organization.

We can't say that the parties simply happen, because they have a deep structure: they are performed and have a meaning for a particular society at a particular time. The place of the party for a collective results of behaviors that ends up leaving material traces in the urban landscape. Thus, the study of parties is a way to analyze social organization forms in urban space and to check the ruptures and permanencies in long duration, verifying in which terms the public space becomes secular and mundane, leaving its religious and symbolic dimension backward and giving way to leisure and fun. We believe that the study of the past can illuminate a better understanding of the present, which means that in a historical perspective, "time" and "space" become two fundamental coordinates that interfere in the behavior and social perception.

In this way, a detailed study of daily practices and uses of public space involves the unveiling of traces left by the past, as in material terms as by means of speeches and/or images aiming to show why and how some parties took place and remained (some still persisting until nowadays) and why and how others have disappeared over time. Through the analysis of everyday life, of the civil or ecclesiastical determinations and of the functions assigned to parties and to processions in each historical period, we aim to restore a complete panorama, showing the permanencies and ruptures in the process and proving that the party has a function and a meaning for the different segments of society, at different times.

The ensemble of behaviors and practices that lead to different ways to read the world through the parties also brings us to the definition of the concept of "party" which also is changing overtime. Mary Del Priore (1994/2000)^[2] explains that the Brazilian parties are a moment of utopia, a political, religious and symbolic fact, according to the meaning that they assume for the various segments of society. The parties have an important social function, since the city and the inhabitants must preparing themselves carefully for them, but this function has changed over time.

The parties that had their origin with the arrival of Portuguese settlers were transplanted in Brazil (AMARAL, 1998)^[3] already modified. Of Catholic-Christian matrix, "the ecclesiastical year" has acclimatized in Brazil in the presence of indigenous peoples and African slaves (DEL PRIORE, 1994/2000), by fusion of other cultural models, assuming new guises, in a process of "cultural intercourse" (NOVAIS, 1997)^[4], "cross-fertilization" or "hybridization" with the local cultural. This resulted in certain specificities and also in the introduction of new parties, miscegenated with Portuguese traditional parties, incremented with local ingredients, coated with new symbols and meanings. We note that there is a mix of values, practices, beliefs, songs, dances and musical instruments brought from the Iberian world with those of other cultures by incorporating their insights and rituals.

Although since the 16th and 17th centuries were being celebrated various religious festivities, little emphasis has been given by the Portuguese administration to their register consequently there is great scarcity of primary documentary sources relating to this period. But, we know that from the beginning of colonization there were various meanings in the functions seemingly irrelevant of the festivities that were so important "to be understood even as the model of action and participation of the Brazilian people" (AMARAL, 1998, p. 55 – free translation).

The parties implicate in a particular social structure of production and if, at first, they were imposed, becoming mandatory, their persistence depended on (and even today still depends on) the community cooperation, if not of all the members, at least of great part of them, since they need to be planned, financed, organized, prepared and enjoyed under peculiar rules typical from of each social group and in a particular historical period.

1.2 A constant presence of mandatory parties: from the colonial to the imperial period

It is noteworthy that being the Brazil, at first, colony of Portugal, for many years it was subject to the *Ordinances of the Portuguese Crown (Ordinances Manuelinas)* and to the ecclesiastical regulations, with own characteristics of a world dominated by the sacred and by the ritual. The parties were considered strategic in the power confirmation of the monarchy and demonstration of loyalty to the Crown. There were four parties considered "real", of mandatory realization and for which it was required the presence of the entire population in the surroundings of a league around the village (at that time): the *Festa e Procissão de Corpus Christi (Party and Procession of Corpus Christi)*, the *Festa do Anjo Custódio (Party of Guardian Angel)*, the *Festa da Visitação de Nossa Senhora a Santa Isabel (Party of the Visitation of Our Lady to St. Isabel)* and the *Festa de São Sebastião (Party of Saint Sebastian)*. From 1756, after Portugal was devastated by an earthquake, the *Festa de São Francisco de Borja (Party of Saint Francisco of Borja)* became a mandatory celebration, because this Saint is the protector of earthquakes.

The government tried to steady itself, seeking, if possible, the spontaneous adhesion of the subjects and "when this adhesion proved problematic, the coercion was felt so that all the inhabitants take part of the jubilation of the Crown" (LAMBERT, 1992, p. 78 – free translation)^[5].

In the colonial period, one of the ways (among others) that the Crown had to be present, was mainly through the so-called *Parties of Representation* (DUVIGNAUD, 1973)^[6], that was parties which celebrated dates and important events relating to the life of Royal Family members and of the Portuguese governments, such as birthdays, weddings, acclamations and deaths. It was common practice, in the late 17th century and early 18th century, that these dates were celebrated not only in Portugal, but in all the Portuguese colonies, which included Brazil. These parties were present throughout the colonial period, but, because they are urban manifestations, only become more relevant in the course of the 18th century.

Also the parties for the arrival of some civil or ecclesiastical authority, known as *Entries* were present in Brazil throughout the colonial period, and they were also of mandatory realization and presence of all the civil and ecclesiastical community members. Both this two types of parties (the *Entries* and the *Party of Representation*) were considered civic parties and they had the function to increase the power of the Crown and the Church that, at that time, still ruled jointly.

In addition to these festivities and increasing the Church power over the life of the inhabitants, it was joined the *Procissão da Publicação da Bula da Santa Cruzada* (*Procession of the St. Crusade Holy Bull Publication*) (which was a religious celebration for selling indulgences), the liturgical celebration and processions and the festivities held in honor of the Catholic Saints, conducted by the vicars of parishes, along with the brotherhoods and lay fraternities, following the ecclesiastical regulations and carrying out the requirements of their own statutes and bylaws. These festivities went far beyond the devotional field, because they became the scene to exhibitions of wealth, power and frequent disputes.

During the slavery period by which Brazil passed by and left numerous traces until today, black slaves and manumitted parties also happened, but they were tightly controlled and supervised by the municipal power that allowed them but only under certain limitations of location and time, in order to avoid confusion and leaks (BRUNO, 1953/1984, p. 371)^[7].

The frequency and periodicity of the celebrations during the colonial period show that the use of urban public space was mainly religious and festive. The parties were imposed, of mandatory realization and participation, but despite this, people do not refused to participate in them, because Catholicism was the official religion and it governed the people's life. Being the Church associated to the State, the Chamber had the "right" to control the gathered human. The mandatory participation of the population in the religious festivities was the way to control the fulfillment of certain rituals required by the State and by the Colonial Administration, besides being a form of reverence to the Catholic Church symbols.

The Chamber published an edict, set in a public place, notifying the occurrence of the party, its nature and calling the residents up for the necessary preparations required that included: the cleaning of the streets, facades and churchyards; the whitewash of the houses; the ornamentation of doors and windows with flowers, towels, quilts, damasks and embroidered velvets and satins; the placement of light fixtures; the coverage of the streets (by which would pass the processions) with flowers and leaves; and the placement of arches and others. All this must be done under penalty of fines and/or jail in case of disobedience. Thus, we can realize that the parties had a role not limited to an accomplishment of a Catholic ritual.

1.3 The decline of the religious festivities the imperial period

At the beginning of the imperial period almost nothing has changed. The parties that happened were the same inherited from the colonial period. After the Proclamation of Independence of Brazil, in 1822, associated with these parties other civic ones were introduced, forming a rich calendar that moved the society of that time.

The situation began to change just after the publication of the *Constituição Política do Império do Brasil* (*Political Constitution of the Empire of Brazil*), in 1824, which foresaw the religious freedom (KANTOR, 1998)^[8], although the Catholic religion keep on being the official and the only one to which it was allowed outside pronouncements. The Law of October 1st 1828, signed by Don Pedro I, was a landmark for this question. Along numerous others issues, it prescribed that the parties would be neither realization nor mandatory presence. The analysis of the parties of this period indicates that the religious nature ones have been gradually losing their place in everyday people's life, and, little by little, a process of secularization was beginning, combined with several other factors.

One of these factors was the desire to regulate the use and occupation of the urban public space. Under this point of view, the parties were considered "a risk to the new cities". Several *Postures* have been made over the years, many of them broached the issue of parties and their practices. Public entertainments were banned. The *Cavalcadas* that recalled the medieval equestrian tournaments and were part of the civic processions and religious festivities were prohibited, although

they belong to ancient custom brought from Portugal to Brazil in the colonial period. The *Cavalhadas* were very important to the society because they were also an opportunity to highlight and mark socioeconomic positions of their participants that were richly dressed. But, they were considered a kind of fun, consisted of a sequence of games and representations practiced on horses which duration could be extended by three days. The *Cavalhadas* were an important part of the festivities and the population shown itself reluctant to abandon this practice. The public authorities, as they could not banned them and also others practices, they decided to begin requiring licenses for the celebration of the parties, always seeking to control and to regulate the practices which took place in the urban public space.

In 1831, for example, the public authorities developed some *Postures* inhibition the fireworks, practice so rooted in Brazilian customs that it was very difficult to extinguish it, even because since the colonial period the fireworks were being used in official celebrations. Although banned, their use was permitted in the days of official parties (MOURA, 2005)^[9], leading to gaps in legislation that favored the continuation of this practice, which persists to this day.

A similar process occurred in relation to the use of masks during the processions, also common practice since the colonial period. In this case, as well as in the previous one, the public authorities had ambiguous attitudes because, although prohibited from 1831, some people masked persisted in wandering on the streets in the days of religious festivities. In addition, the public authorities allowed and tolerated the use of masks in some situations, as in the days of official parties, opening once again gaps in the same legislation, but allowing farces and jokes only during the day, forbidding them at night. We can realize that the clear goal was to control the fun freedom under the guise of morality.

Another common practice that came from the colonial period and remained until the beginning of the Empire was the request for alms to the festivities of the Catholic Saints. In 1832, at the time of progressive secularization of public space that was beginning, the public authorities published an unique posture determining "fine and imprisonment for those who ask for alms to celebrations of Saints, outside the doors of churches and chapels and by the streets".

Also the peal of church bells were controlled, because it was considered abusive, prevailing the touch only on the religious festivities days in the name of what it was understood by "public order" at the time of civic or religious festivities, under penalty of prison (MARX, 1989/2003)^[10].

Even vehicular traffic on the occasion of some religious or profane parties in certain and specific places was banned, especially in Holy Week Celebrations. Also the custom of making holes in the streets for the construction of a gazebo or even to nail the mast of the party was banned.

Anyway, the public authorities from 1830's to 1870's had a predominantly educational function what would change in the following years, because they would have the services as predominant goal. With all these determinations adopted, it seems that under justification of regulating the use of urban public space, they aimed also to impede or even forbid social practices directly related to the occurrence of parties, frequent since the colonial period, and which came to be seen as a "threat" to such order target. The public authorities sought to introduce a new political order and the change of customs, aimed to a standardization and consequent population submission to their authority. To do this, they appropriated themselves of parties that took place in the urban public space as "means of control, moderate and put under permanent surveillance the people gathering, because they saw it as an obstacle to their claims of political stability" (MOURA, 2005, p. 201 – free translation).

In this period, the mandatory preparation of urban public space for the realization of the parties, which was, until then, under the responsibility of the population, expired, passing it to the responsibility of municipal public institution. Simultaneously with all these obligations that ceased to be in force, many of the practices that have occurred in the course of the parties were prohibited or even allowed only if licenses were requested for their occurrence, which caused the Chamber to have full power and control over their realization. Although there has never been a sudden rupture, the Catholic religious practices were gradually coming into decline after the *Proclamation of the Republic of Brazil*, in 1889. Several aspects of the official structure have changed, resulting in impositions that affected until very recently in the way of living of the Brazilian people and in the contemporary urban arrangement.

1.4 The beginning of the rupture: the Republic

In the first *Republican Constitution of Brazil*, dated February 24th 1891, Brazil was declared a secular territory and it was broken off the secular relationship between Church and State. Because of this fact, the civic parties supplanted the religious ones in importance. With the new capitalist and bourgeois world-view, Catholicism began to be seen as a delay for the development of Brazilian society.

From the Republic, there was an intention to organize and to improve the urban public space. From the Republic, there was an intention to organize and to improve the urban public space. It was clear the replacement of the use of urban public space and urban progress indicators in the urban

space that the cities spent since the last decades of the 19th century and the first decade of 20th century. The municipal government aligned itself with the new conceptions, which sought to transform the cities into places for the realization of "modern life", aiming to convert them into healthy and of good taste, so they could receive activities and "chic" populations. While the previous system was based on the tradition, on the slow changes, the present promoted the dynamics of quick changes, imposing a disconnection with the past (BARBUY, 2006 – free translation)^[1].

The city went through profound metamorphosis from the end of the Empire to early Republic, especially the years 1870's to 1900's, which led to profound transformations in the social order, economic relations, in the redefinition of political institutions and patterns of urban space occupation. Portraying the cities at the turn of the 18th to 19th century is handling of numerous ruptures and permanencies that took place in the conformation of the cities in general, especially in São Paulo. These changes in the form of the town planning also entailed changes in lifestyles and sociability of the different social classes, emphasizing the public parties as a transformation vector.

The urban development during this period was strongly conditioned by the laws of urban content then established by the public authorities. The popular parties were subordinated to the *Section of Police and Hygiene* that watched over the maintenance of order and occupation of public space which justifies the control exercised over the parties, by requiring *licenses* of function, and by paying bails and deposits for some eventual damage caused to public land. The parties, which took place on the streets as a process of popular appropriation of space, in the context of elation and joy of the people gathered, started having more intense control of municipal power. The executive government had a decisive influence on the daily lives of the inhabitants, exercising greater control over the life of the city through the *Municipal Postures* that regulated the works, the public hygiene, the functioning of commerce, the uses of public places etc., what means that all this interfered directly on the celebration of parties.

With the dawn of new times more attentive to the mundane, to business, to everyday life, it prevailed almost absolutely the civil laws and customs. At first, the Crown aimed to collect more taxes, saw the parties as opportune moments for trade which tended to increase, leading the urban space to secularization and conditioning the valuation and improvement of the common use areas for other purposes (trade, service, business) in detriment of their symbolic and religious use. "It could be said that the constant and slow secularization meant the decline of the party in face of the business, the decrease of the holidays in face of the increase of the days now called useful" (MARX, 1989/2003, p. 59 – free translation).

Most Brazilian cities grew quickly from the late 1890's resulting from a population explosion due to the arrival of thousands of European immigrants, mostly Italians. Along with these immigrants came new customs, resulting, at that time, the various ethnic parties, especially the religious ones, with the intention to preserve their culture and identity, although geographically distant from their homelands. The accelerated urbanization has not been able to quell the religious festivities (although there was a certain retrenchment), arising, among others, several Italian parties such as the *Festa de Nossa Senhora d'Achiropita* (Party of Our Lady of Achiropita), the *Festa de San Gennaro* (Party of San Gennaro) and the *Festa de San Vito* (Party of San Vito), which are celebrated until nowadays.

Thus, the parties that, in the colonial period and early Empire, were mandatory, being pretexts for the construction and organization of urban public space, from the Republic and mainly in the early of the 20th century are being appropriated gradually. Cities grew up and became internationalized, deleting old customs and overshadowing ancient traditions. The parties that celebrated the faith weakened, but remained in the big cities, being held in places more distant from large urban centers, and fewer centralized. There was a growing process of secularization of Brazilian society by tensioning the interests of the government and community traditions, period of effervescent changes and of redefinition of the role of city regionally and nationally, becoming urgent the "construction" of its memory.

The new clergy, formed by priests coming from the Northern Europe, followed the regulations of Roman Catholic rites, devaluing the popular practices and considering the festivities as a focus of vagrancy, stimulated by the presence of tents of games and theatrical performances. These priests believed that the clergy should be moralized and the power of the Church should be strengthened and respected. Consequently, the lay brotherhoods lost their power, determining the decrease of their ostentatious character in processions, reducing some parties to single parish meeting, very focused only on religion.

1.5 The modernist city and the metropolis: new points of view for the parties considered as intangible cultural heritage

Anyway, the universe of parties has changed, and has restricted and swerved to distant neighborhoods, leaving gradually the central area of large cities although the *Parties and Processions of Corpus Christi* follow polarizing a lot of people in mid of 21st century.

In the early 1920's, a time of nationalism among Brazilian intellectuals, it was seeking the Brazilian identity in the traditional roots of national culture, as a result of new habits and mentalities printed to everyday life by the presence of foreign immigrants.

Under the impact of the modernist movement and the various studies that discussed the "being" Brazilian, the "nation", the "national identity", it was established, from the 1930's, new paradigms for the Brazilian parties that became to be seen not just by the use and occupation of urban land, but rather as responsible for the construction of a cultural identity, since, from then on, the concern revolved around the impacts of the accelerated urbanization process over the traditional cultures, religious syncretism and acculturation processes.

Under the point of view of the administration of the Brazilian cities, these new concerns led the parties to be treated not more under the point of view of the use of the land, but of the point of view of the culture and fun, being their control transferred to the *Department of Culture and Recreation*, first institution of the municipal public power in the cultural area.

It was from the 1960's, and especially in the 1970's, under the *Nouvelle Histoire* that advocated "an anthropological approach of collective phenomena and politicization of everyday life" (JANCSÓ; KANTOR, 2001, p. 7 – free translation)^[12] that the parties began to be experienced and discussed in dialogue with history, anthropology and sociology, associated to relationship and social formations resulting from the increasing urbanization process of Brazilian cities and to the economic transformations under way, along with all their symbolic and artist values.

Since then, the parties gained more power, occupying a privileged place in Brazilian popular culture, acquiring importance and particular meanings to the point that led the *Instituto do Patrimônio Histórico e Artístico Nacional* (*National Historical and Artistic Heritage Institute*) (IPHAN) – a federal heritage institution and an autarchy of the *Ministry of Culture* (MinC) – to consider them as history landmarks, very important to the construction of the memory and national identity, then being considered in Brazil and worldwide as "intangible cultural heritage".

Since the First Republic the public government began to intervene immensely in the urban space and the political control of the day-to-day of people, orchestrating the realization of popular parties. On a national scale, some of them have acquired importance due to their cultural and spatial dimension to be considered, in Brazil and worldwide, as cultural heritage, since the concept of heritage currently practiced has been extended and includes a list of natural material and intangible goods.

Specifically in the case of Brazil, some parties were registered from 2004 by IPHAN in the *Book of Celebrations* as Brazilian intangible cultural heritage, they are: the *Festa do Círio de Nossa Senhora de Nazaré* (*Party of the Candle of Our Lady Nazareth*) (in Belém), the *Festa do Divino Espírito Santo de Pirenópolis* (*Party of the Divine Holy Spirit of Pirenópolis*) (in Goiás) and the *Festa de Sant'Anna de Caicó* (*Party of St. Anna of Caicó*) (in Rio Grande do Norte). It should be added that there are hundreds of other religious or profane parties, many of them of great importance not only for the local community, but also for regional or national culture and they have been proving as a powerful mediation between cultural, economic, symbolic, touristic and others structures seemingly irreconcilable, making it possible to penetrate and understand the parties that moved and still move the Brazilian society.

1.6 Final consideration

Thus we observe that, over the years, the traditional parties have changed not only in Brazil but in the contemporary capitalist societies in general, where there is no hegemony of time governed by natural cycles. These capitalist societies preach the rationalization of time and economy of goods, resulting in the abandonment of certain traditions that became adapted to new situations. The *Industrial Revolution* clearly separated work time, leisure time and celebration time that became the time available after being fulfilled the obligations towards the work. The devotional and religious parties have not disappeared, they persisted, continued to exist, permeating the everyday people's life, and not just limited to the Catholic religion, but expanding themselves to several other religions and different typologies of parties and so they ended up composing a rich universe of thousands of parties that move the society and remain interrelating culture and tradition and become important moments of sociability, and gain other types of approaches: by economic importance to the community, by tourism, by popular culture, by leisure and by fun.

So the parties reach the 21st century in new hands and with new modes of action, being frequent disputes by political and economic control of those which currently increased not only in numbers but also in proportions, although when compared to parties held in the past centuries, we note that, in many ways, they suffered an impoverishment process. The parties that grow up tend to occupy large spaces in urban centers and having large space indicates their importance and their place in the life of the cities and of the country. Usually this happens in places where they have become mass parties, what can be explained by the large-scale urbanization that allows access and reception of people from everywhere.

Everything indicates that the people have been reinventing their parties in new conditions of their life, resulted from new social and urban contexts. The ancient popular parties, shared by large numbers of people (mostly religious parties) fragmented into different ways of celebrating according to they were forming groups as a result of the growing process of capitalist development, and the consequent social division of labor, of spaces, of social classes and, especially, the growth of different religious denominations with different ways of celebrating (AMARAL, 1998).

The sense of "obligation" as well as the parties associated with civility (that reproduced battles, yielded tributes to heroes, personalities and myths) completely disappeared. The popular parties are now increasingly coated of characteristics of rupture, innovation, leisure and fun expressed in the festivities associated with religiosity; in the liturgical ones; in those held in honor of the Saints; in those linked to agricultural calendar cycles, as the harvest parties; in folk festivals; ethnic celebrations, simultaneously religious and profane parties or even in those exclusively profane, such as the Carnival.

Anyway, there are numberless parties that compose the universe of Brazilian popular parties taking place throughout the year in several Brazilian cities and making Brazil stereotyped nowadays as the "country of festivities", "country of fun" and "country of Carnival".

It is opportune also explain that to understand the Brazilian public parties in a historical perspective as wide, it was necessary to use different sources, since there were religious, profane, civic and others parties which were organized by different and independent institution and currently they are very linked to certain public organization by their great commercial interest. In addition, most academic studies on public parties, addresses them under different ways, such as by the economic importance to the community, by tourism, by popular culture or other aspects but, generally, they do not emphasize the transformations undergone overtime, mainly relating to modifications of the use of urban public space as a place of sociability directly connected with the lifestyle of people.

Therefore, we hope that this paper will contribute to this theme still so new and so little explored under this point of view, especially if we consider the current state in which the popular parties are, not only in Brazil as worldwide, when the parties are being considered a privileged place in society, because they are an ensemble of symbolic systems that must be understood, decoded by all the people who participate on them and who govern the urban behavior, the social, economic and political organization.

Pursuit of style: the importance of historical, archivist and treatise heritage.

Abstract

Today we live in an era in which globalization has flattened the architecture to few stereotypes, dictated by few Archistar, unfortunately leaving little room for local identities, which for centuries have characterized not only the types of buildings and construction techniques, but also a current of treatises that revealed methodologies and practical tips to build.

It is often forgotten that, apart from the tangible element of built architecture, there is an important historical heritage that helps us to know deep within that same architecture, analyze it, understand it, and store it in last: the historical treatises, real encyclopedias of good building practice, cataloging and presenting the information necessary for a construction site in a workmanlike manner.

To each historical period are associated techniques and designs, so the good restorer must first be aware of the treatises most common in the historical reference period and then know how to approach the historical heritage: knowing even before investigating it with technological equipment.

A case of study, taken as an example, is inspired by the Baroque era treatises by Rondelet to Breyman, by Valadier to Rusconi and even up to Vitruvius; from their boards and writings has been inspired to understand how a building could be under the formal aspect, imagining how to build it, and dreaming about a representation typologic theme.

Keywords: Cultural Heritage, Historical Heritage, Treaty, practices of building, Architecture practices

1. Treatise of best practice

How many times we had a lively discussion on the future of architecture? How many times the architects contest the new (few) architectures?

Apart from the mere subjective and taste matter for which contemporary architecture can pleasure as also not pleasure, but we need to recognize two fundamental questions.

First of all, despite the inherent beauty of some contemporary architectures, there is no more an awareness of the places. The urban context given from simple physical boundaries of the plot is the only limit to the design, without being able to overcome other cultural, social and historical barriers.

It appears that the styles are now imposed by a few ArchiStar, who are more interested in spreading their *Ego* that to take an interest in the dynamic characteristics of a place, autochthonous housing types or simply lifestyles that have evolved for centuries.

However it could also give rise to a doubt: these are the personal styles to be connected to these alleged ArchiStar, or are the latter to be slaves of their own styles?

That is, who refutes that when an institution commissioned a architecture work chooses the architect for his professionalism? Occurs as the impression that one chooses the shift ArchiStar depending on how and what style it wants for that place.

It is a fact that still does not take more account of the place of intervention understood as a set of culture, history, customs and traditions, but paradoxically we are entitled to make a pitch roof in a sea area where not really snow ever, and a flat roof in the mountains that is likely to collapse at the first load of snow unless oversize (also in the costs) the ceiling.

The second fundamental issue, as premise, is that in Italy, almost for *contrapasso*, history instead is part of each of us, we grow with it, we look the history around us but distracted now. History and culture are in our baggage and are inseparable from our ways of thinking and seeing things: perhaps this is also the reason why many are horrified in front of the insertion of the contemporary in a historical context.

But, as mentioned, precisely because the story is in everything that surrounds us, we have also grown accustomed to it, to its valence and also, why not, to its importance.

It's truth in general to every sector, but in a particular way I am thinking at that local entity in the ways to build that for centuries has characterized our country, and not only in a unique way, but multiple: from north to south the construction techniques are hundreds, all beautiful, functional, and quite justifiable, from the portico Piedmont to the apulian trullo (round hut typical of the Apulia region). But in fact we don't speak only of a typical and local building typology, but also of the construction techniques that are obviously at the base of them.

On the other hand, in spite of the development of contemporary architecture, not a case, in the field of restoration has occurred in recent years the development of research merged into manuals of the recovery (of Rome, of Città di Castello, Palermo et c.) very useful to understand the practice of construction.

However, they are nothing more than the echo of a large production treatises, which has intensified since the sixteenth century to the nineteenth century, which for centuries had bestowed and absolved practical advice on how to build things, transcribing of course what daily was done in practice in building yards and job sites.

In most cases the authors begin by giving basics on practical constructive, from main definitions to the choice of sites where you can build, and then move on to more specific information on materials to be used in the construction industry or to the ways to reinforce, from the cleaning of the surfaces to the geometries and classical proportions. Not missing also information on ways to build more engineering architectures, as the aqueducts and the military building. Of course it also give the precepts to be able to draw maps through the ancient art of the gnomonic, by exploiting the principles of the projection and the theory of shadows.

Perhaps the ancestor of this vein was the *De Architectura* (between 40 and 25 b.c.) of Marcus Vitruvius Pollio, repeatedly translated and expanded, as was used by literary Renaissance, through diagrams and drawings often by the same author.

And it is not by chance, given the premise, we start from the "foundations", from the perfection of Vitruvius: we architects we lost those values that for centuries have governed the way to make architecture? We are still able to join *firmitas* (firmness), *utilitas* (usefulness) and *venustas* (grace)?

In the version translated by Antonio Rusconi in 1590, which among other things contains some splendid drawings, it speaks very clearly of the three components: the *firmness* which of course includes the use of the material, from the brick to the mortars, from pozzolanas to the stones and the woods; the *functionality*, which depends on the quantity and quality of architecture; finally the *beauty* or *grace* based on the rules of symmetry, harmony and decoration.

Upstream of this virtuous "trinity", there is the very act of the manufacture. It is interesting to note that Vitruvius already distinguished between a manufacture in theoretical action and practical action. From practical action is prosecuted for the three components mentioned above, while the theoretical action is expressed with numbers (you could say the modern science of constructions') or with lines, i.e., the drawing in its likenesses of plan, elevation and profile.

It is evident that a text of the I century B.C., which still today is so contemporary could not have that overwhelming dissemination that he had from the Renaissance onwards, influencing obviously also all new writers that also put themselves on trial with constructive techniques more innovative.

But what is more interested in the Vitruvian treatise is the methodical and clear explanation of the different materials, their use and the way of laying, how one can check in the second book.

The first material quoted is the brick that was also the most widely used in historical buildings.

It explains that to create the bricks you must use a chalky ground, not sandy or rocky because it crumbles over time, and it would still be too wet if exposed to rain.

The better period for their manufacture is the spring or the autumn, as in the days of solstice the sun should dry too quickly the superficial parts of the brick leaving raw those inside, which dries posthumously and will crack the portions already dried. The drying time should be approximately two years, good time to ensure that the brick is completely dry and not continue to contract their own forms and consequently rub the other bricks and compromising the stillness.

There are three types of bricks called *didoron*, *pentadoron* and *tetradoron* (compounds of *doron* in Greek) i.e. two, five, or four palms. The type most commonly used in ancient Rome was the *didoron* which corresponded to the brick of measure a foot by half foot that corresponds to two palms.

The way to lay the bricks by and equally explained in a contemptuous manner, so as to avoid any type of overlap the joints, and also depending on the thickness masonry: one, two, three or four heads.

Fig. 1: The types of bricks and their laying; an illustration showing the tasks and functions inside a brick factory. Images from "The ten books of Architecture" by A. Rusconi, 1660, pp. 49, 50.

Fig. 2: an actual brick factory in Fez in Morocco still applies the ancient techniques (photo by Daniele Calisi).

Most of the information that is given by Vitruvius, not only for the brick, but also for other materials, they are real practical knowledge which usually were handed down from generations, but that actually were missing on a coding the make them overt and public.

However it is somewhat difficult to treat in this place all the materials (sand, pozzolana, stones, wood) that are described in *De Architectura*. We will restrict ourselves to deal with some materials, also based on the complexity of the representing boards that characterize the treaties also later than the reprints of the opera Vitruvius.

In particular we have chosen, both for the importance of works, both for the beauty of the drawings, some treaties that perhaps better explain the importance of this literary genre.

One of the most beautiful and interesting is without a doubt the treaty "The architecture practice" by Giuseppe Valadier of 1829, which actually is a collection of his lessons as a teacher at the Accademia of San Luca, divided into five volumes, each with their own topics analyzed elaborately.

The same Valadier cites and praises the ten books of Vitruvius, criticising the many translations, or perhaps better interpretations, that have been made, and praising those few cases in which the original text was rendered faithfully (as with Antonio Rusconi or with the Marquis Bernard Galiani in 1758).

Also in this treaty we can find many useful information for every type of construction; in the first place on the choice of the land on which to start the foundations, which must of course have certain characteristics, but also all the information you need to solve the problems of the land. An interesting step can be summed up in a few sentences all the problems of contemporary architecture described at

the beginning: "...check this information, will redound the building in these aspects, which, according to the geometric knowledge, and astronomical you will find more convenient to take the parts, and environments appropriately; using the practice which requires the way to base your compass to discover aspects of the sky, and can with the cognition of the geometry will mark the wholeness, and the parts of the yard with precision. If this building will be surrounded by houses, or by roads, you will always consider the best aspects of that locality, and in this you adapt in the composition of the plant, the scale, the rooms, the library, the wardrobe, the closets, tinelli, stables, barns, and anything that is wanted to by the owner, by giving them these aspects convenient for having at the end a advantageous and commendable result." (Valadier, 21-22 p.).

Which in practice means that it is not possible to disregard the context when doing architecture.

The text clearly describes the ways to build, making continual reference to the figures in the attached tables, of ten a Iso m asterfully watercolor, b ut a Iso s hows t he t ools t hat a re u sed i n c onstruction phases, often also by providing the right way to achieve them.

Among the many tables in different volumes there are some worth mentioning.

First of all, the LXVI (but also the following), in the second volume, which is the right way to achieve the *capriata* (truss). Today, some of these wooden structures, fascinating balances of forces, are made perhaps only in rare cases for rollbacks, but new technologies (such as the laminated wood) have gradually replaced them. But who is it that deals with restoration of monuments cannot ignore the existence of such a valuable drawing that with detail and figures, diagrams and nomenclature, shows almost the whole survey of joints wood - wood, wood - wall, iron-wood.

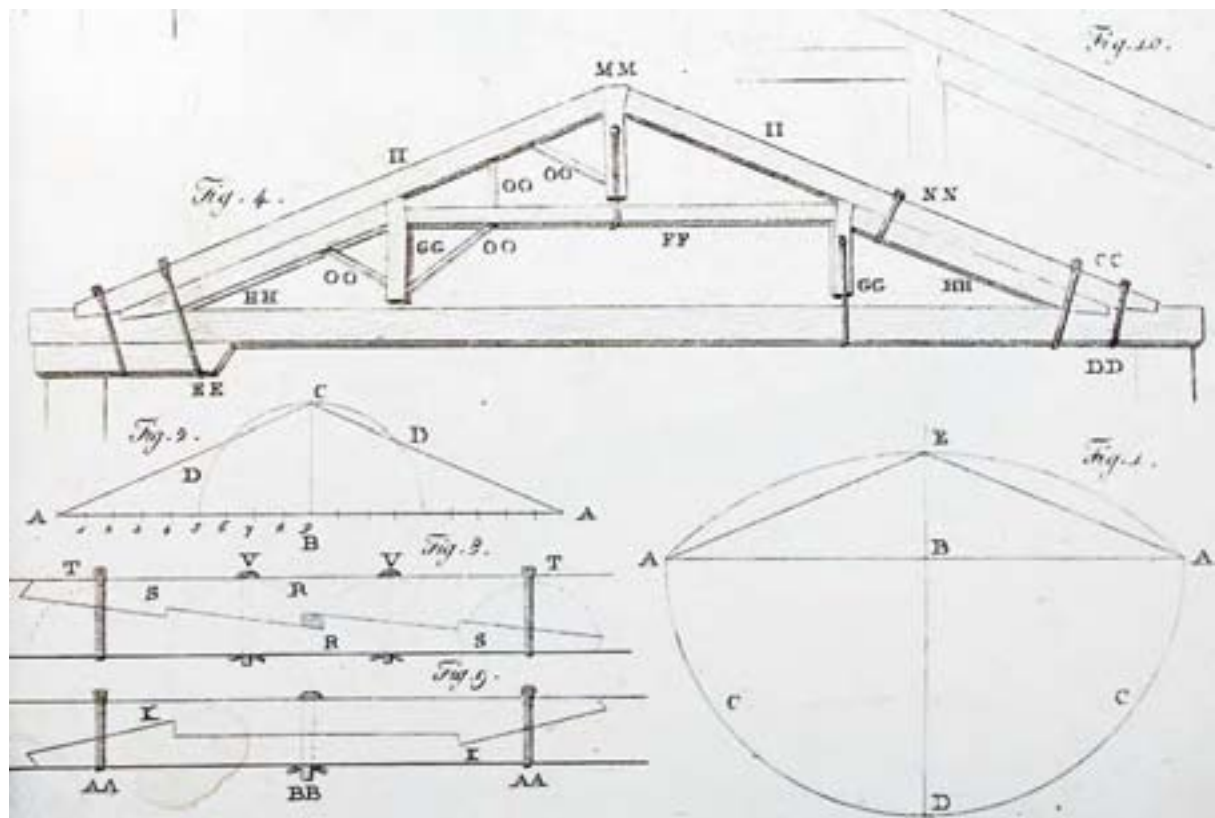

Fig. 3: Truss with three monks and details of the couplers between two half beams to form a single link, table LXVI.

The first type of joints had to be made with a roughening stepped version of the terminal part of the wooden beam, in a manner perfectly complementary with the other beam that was to connect perfectly to it. The adhesion was also guaranteed by due brackets and hoops of iron. Of course the trussed roof had to be clasped to the masonry to ensure maximum stability, often using the metal chains to clip to the trusses and drown in the masonry itself. The one of the chains of iron was a method widely used to increase the stability of structures, because (as for the reinforced concrete) obviously resisted the traction forces.

Even the art of forging of these chains is widely described, both in the diagrams of interlocking of tie and bolted end - plate, both in particular terminals (heads) in a way "half and half" or "beak of flute", with accurate brackets to avoid the reopening of the beak itself (table CCLXXVII).

Fig. 4: Masonry vault reinforced with the use of a chain in iron. This first example shows a type of chain very rudimentary and probably the same used by Borromini. In fact are of this type the chains that join the four bases of the tower of the clock at the Oratory of the Filippini. The chain has a terminal with union "half and half" (eye E) and "beak flute" (tie F).

The chains are then anchored with bolted end - plate. At right a drawing by Daniele Calisi.

Another interesting pattern is found in the table CCXLVI of part IV, in which Valadier shows a way to realize the vault in brick masonry with filling in concretion.

In this case Valadier also assumed a further lightening the weight of the vault through the use of empty vessels or amphorae as often did the Romans (one example among many is the Mausoleum of Sant'Elena on the via Casilina , 300 A.D.).

The practice is always dictated by common sense and, of course, also from the experience of generations that experiencing have understood best practices, more suitable.

It is no coincidence that a technique of lightening of the floors, which has been used for centuries, it is also conceptually at the base of many modern construction techniques, that even using different materials, new and more technological, there is no shortage of insert parts resistant but empty for precisely reduce the overall weight of the floor.

It's fascinating analyze how techniques, materials, tools, be handed down for centuries, and remained almost unchanged for generations in generations.

Fig. 5: masonry vault lightened with the use of amphorae and detail of the set of the vault of the Mausoleum of Sant'Elena in Rome.

The vitruvian opera on the other hand could only be the prerogative of a few writers during the dark ages of the Middle Ages, when the majority of the scientific production is moved to Middle East. It is extraordinary that such techniques have survived the passing of time only thanks to the daily practice of workers in yards, and their ability to teach and pass on these techniques.

It is also true that if these techniques came to us and thanks to the many treaties that allow us to study the techniques even in different historical periods, to understand how they have evolved, and what more important, to be able to determine with good accuracy how an architecture has been made, what materials, what can we expect to find inside (chains, tie-rods, lighteners, amphorae) that is essential for a good restoration. Therefore, it would be desirable that all the staff in operations of maintenance, consolidation and rehabilitation of the historic architecture study from time to time, the treaties contextual to the historical period of the building on which to intervene.

On the other hand the architects used those manuals in their own time to find the best way to realize their buildings.

Another very important treatise is written and illustrated by John Rondelet published between 1802 and 1817, divided into five tomes for a total of ten books.

On this treatise must be particularly praise the wide description of the systems of centring for multiple structural or support purposes.

The ribs are the wooden structures of aid, more or less complex, which were used for the manufacture of the vaulted structures and floors (but on the other hand, even if using modern materials, these operations are also made in modern jobsite). So they also have a centuries-old tradition in the construction industry, we need only think of the use of wooden structures in Roman architecture, evidenced also by the presence of holes tips on travertine.

However, the complexity and beauty of those described and particularly drawn by Rondelet are such as to make them unique in their kind. On the other hand a good part of the treatise is dedicated to stereotomy, the art of cutting the stones for the building industry, for which it is clear that in order to withstand the weight of stone blocks masterfully carved served of wooden structures very complex capable of withstanding the thrusts.

Fig. 6: Some examples of the centring useful to support the vault as shows by G. Rondelet on his Theoretic and practical Treatise on the art of build.

Obviously the ribs also served for the construction of vault in concretion, creating a plan of support for the bricks.

In general, they were put into shooting thanks to the use of sandbags placed under the main beams, a method useful for the next disassembly of the ribs themselves: once the vault is finished and dried

properly, it proceeded to disarm simply emptying the sandbags, releasing the tension of the centring that leaked accession with the vault and finally could be dismantled with ease. Among other things, as we often tend to do with the "tubi innocenti" today, the disarmament could occur gradually, so as to accustom the turn to their own loads.

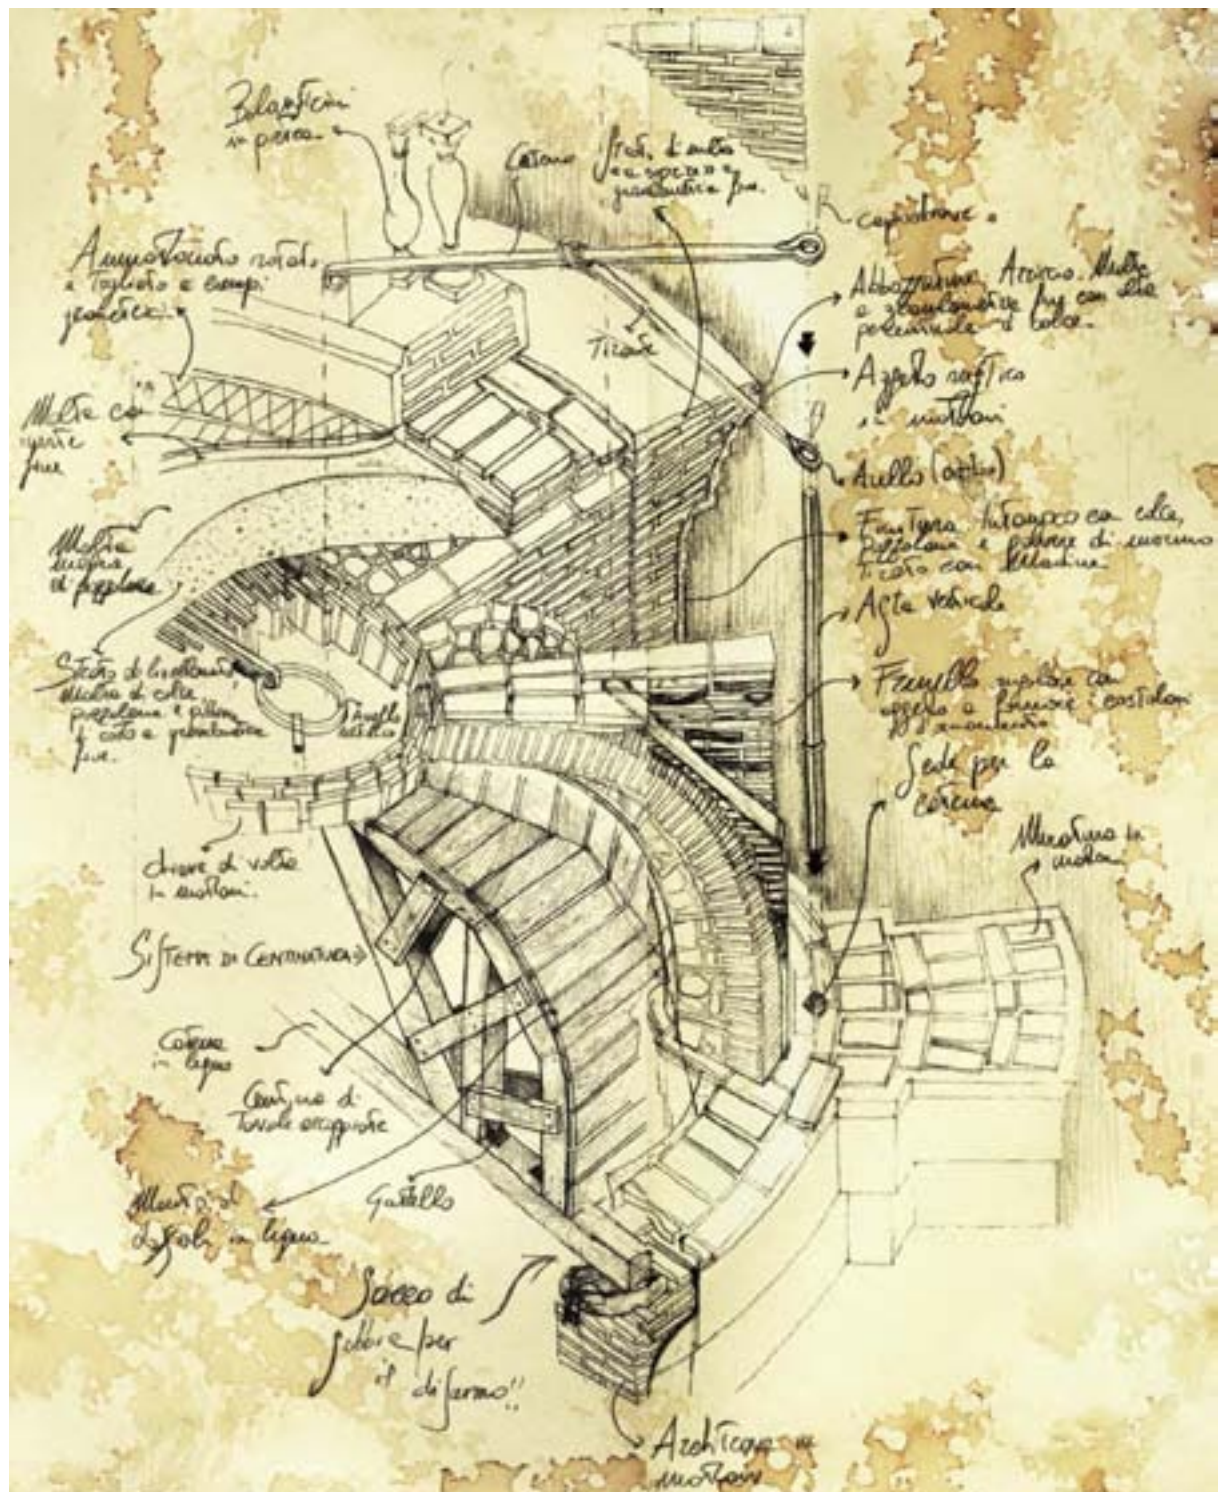

Fig. 7: Axonometric view that highlights some of the load-bearing structures made of bricks and concrete, those of aid as the centring, the finishes of the plasters and paving and those of aid to the stillness as the chains and tie rods. In particular, for the hypothetical construction of this architecture, are used a kind of vaults composed of structural arcs called "frenelli" and fills in stones and concrete. The key to the vault is composed of a disc of bricks placed in cutting and the chains follow the trend of key and the angular frenelli. The brickwork follows the rules to avoid the overlap of the joints. A nomenclature and short descriptions are directly related to the individual parts. Drawing by Daniele Calisi.

The last, but not for importance, is the "general treaty of civil construction" by Gustav A. Breymann of 1884, in which, compared to other similar writings, the theme of the construction of masonry brick is treated in a very in-depth manner.

Especially Breymann exposes, accompanying the text with excellent graphic boards, the manner of making brick walls in one, two, three heads, and beyond, providing several special cases: the angular solutions and sharp edges, the columns also of complex shapes, the way to intersect the main walls with secondary walls also not at right angles, the way to built the compartments for the flues inside of the walls themselves, and more.

All solutions are extremely fascinating, also because Breymann also provides a way to built a solid wall and statically efficient thanks to the alternation of different layer of bricks. The ability to not coincide the joints between bricks, in the transition from one layer to another, ensures a better stability to the wall itself, and for this reason, the treatise provides in its tables, and for each example he shows, the diagrammatic representation of the positioning of the bricks for four consecutive layers. After the fourth naturally one has to start again from the first.

These schemes are of course dictated by experience, by the practice of job site, and a logical reflection on the static nature of masonry brick. On the other hand, the vast majority of the historical buildings of a certain importance was built in bricks, which were then coated with plaster, the most used over the centuries.

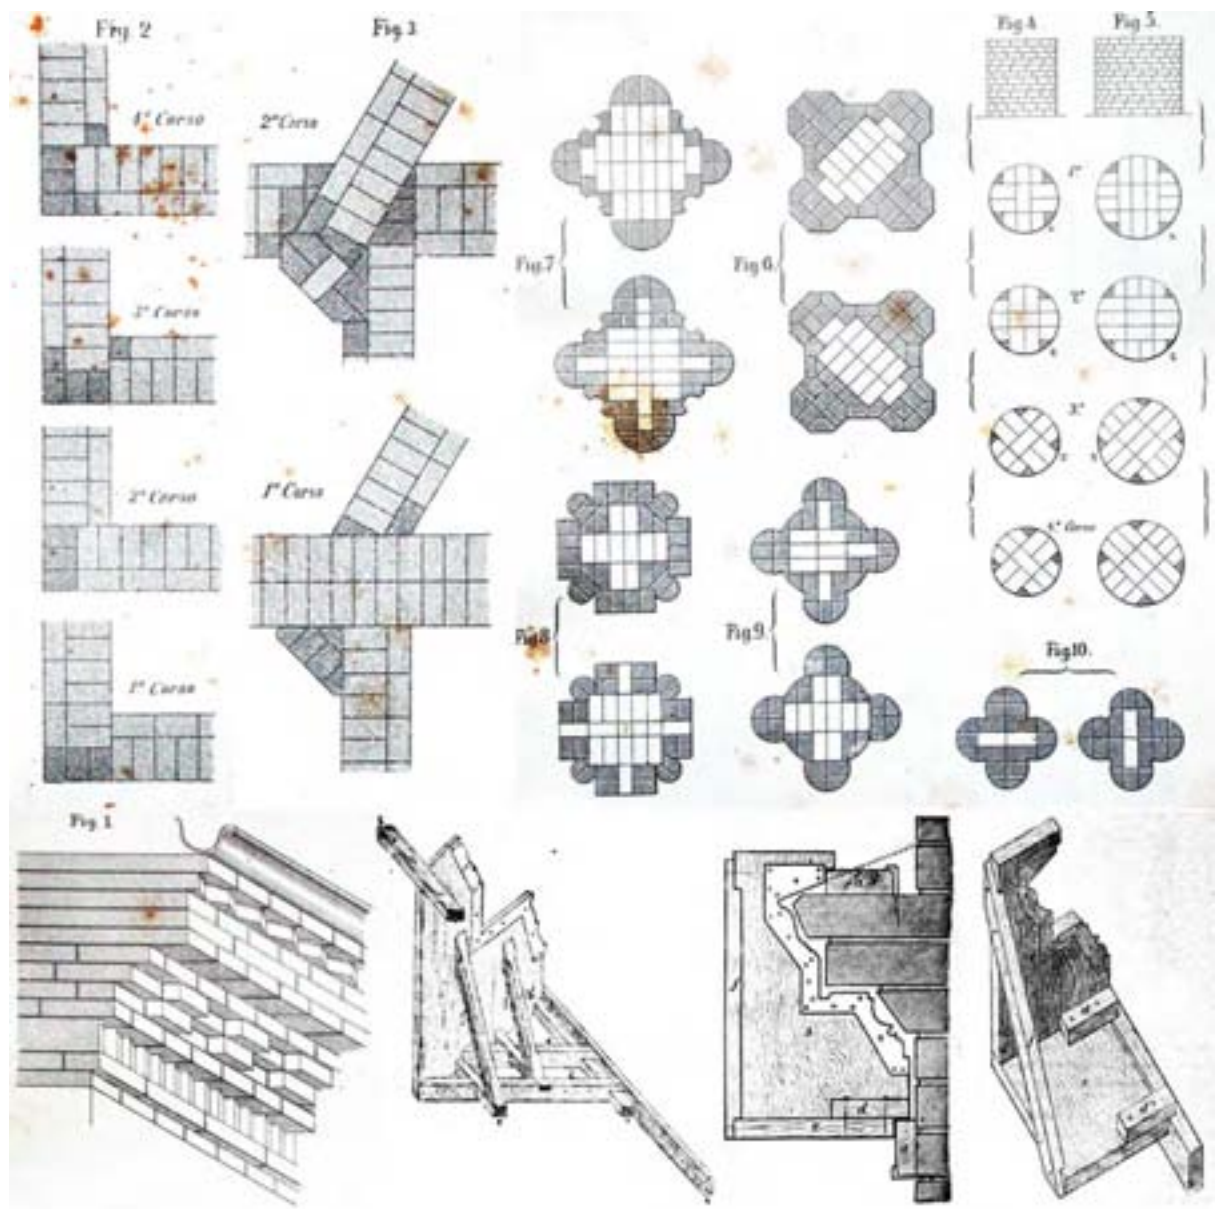

Fig. 8: Execution of a wall in three heads with more layers and interlocking with other walls; correct execution of pillars in bricks of different shapes; rustic brick lug by finishing with a plaster to more layers pulled with *modine*; two types of *modine* for making classic moldings.

Also on the right way to make the plaster one can find a large amount of advice, since the treatise vitruvian where the author exposes the materials to be used to create a plaster-of-the-art in seven layers with different granularity. In the treatise of Breymann we also find an interesting explanation of the instrument for achieving the moldings, called "*modina*": made in wood allows you to pull the plaster giving it the shape of the moldings designed, and, in the version mentioned, also allows you to not to fall off the plaster in excess on the lower floors, but to exhaust it in the side container always in wood. The basics that one can learn from these treaties are many, and very useful also in contemporary construction. Perhaps today cannot be built using these techniques, but they may first be useful for the restoration of the monuments, but can also provide inspiration for new constructive technologies: good knowledge of the evolution of the construction techniques, understand the errors and achievements over the centuries, imitate also (if you want to) are the best starting point to create new ideas. The great importance that today is given to the cultural and architectural heritage (theme more and more popular) must obviously be extended not only to what is tangible and verifiable. Our heritage is also done by customs and traditions, and sometimes need to remember that the local entities are very important and should be protected. In that sense also the treaties mentioned in this article, but also the whole production correlated, are part of the cultural heritage because they contain very important information on the evolution of the building, historic architecture, and the society itself.

Heritage Management in Sydney, Australia – A Case Study on the Replacement of Degraded Sandstone on Heritage-Listed Buildings

Abstract

Australia is often dismissed in the world of heritage as uninteresting because of its so-called “short” history. However, Australia has a rich cultural and natural heritage spanning tens of thousands of years. Colonial and Post-Colonial heritage, in particular, demonstrates a unique response to an unfamiliar environment in a remote outpost of the British Empire. Over 200 years since colonisation and over 100 years since the formation of the Federation of Australia, the question of what to do with the monuments and structures built within the first two centuries of occupation has been much discussed. The choice between preservation and reconstruction is paramount. A building which has undergone much alteration, repair and replacement of fabric over the centuries is Sydney Town Hall, originally built with oxidising sandstone from Pyrmont in 1868. The issue of what stone to use for the replacement of the original fabric is vital to the conservation programme. This programme dictates that badly degraded stone be replaced with an equivalent or “like” material. Investigations into the location of active sources of sandstone have been undertaken, including the consideration of a non-exhausted section of the Pyrmont Quarries known as Hell Hole. Although the stone was found not to be of high enough quality for the repair of heritage buildings, this study shows the importance of finding new active supplies of sandstone for the conservation of Australian heritage.

Keywords: Australian heritage, sandstone, conservation, petrography, mechanical characterisation.

1. Introduction

Australia has a rich cultural heritage spanning tens of thousands of years which needs to be conserved for posterity, so that future generations may know and understand Australia’s past. It is vital that built structures, as important markers of past events, communities, people and shifts in ideology, are conserved so that they continue to visually demonstrate the unique response to an unfamiliar environment in a remote outpost of the British Empire. These Heritage-listed buildings cannot be left on their own, as over time they will slowly decay and become ruins. They must therefore be conserved, whether by preservation or reconstruction.

In terms of built structures, preservation, according to the Australian *ICOMOS Burra Charter*, involves the maintenance of the fabric in its present state and the prevention of further deterioration, while reconstruction ascertains to replacing existing fabric with new materials in order to restore the building to a previous state [1]. Once the cultural significance of a building is determined, the decision between preservation and reconstruction is a difficult one to make. The *ICOMOS Burra Charter* of Australia offers a careful approach to change to heritage buildings: change “as much as necessary to care for the place and to make it useable, but otherwise change it as little as possible so that its cultural significance is retained” [1]. The fabric that undeniably needs replacing in heritage buildings must be replaced, and with like materials, so that historical and cultural significance is maintained. The major problem is that of finding a source of material that matches the fabric and history of the building [2].

The problem of sourcing new material for reconstruction of elements of Heritage-listed buildings is demonstrated in the case study of Sydney Town Hall. Originally built between 1868 and 1889 with oxidising sandstone from the Pyrmont Quarries in Sydney, Town Hall has played a central part in the history of Sydney and is a significant part of the historic streetscape [3]. Over time, much conservation work has been conducted on the building, including alteration, repair and replacement of fabric.

Sandstone, though a permanent material from which to build a structure, is not completely indestructible. Deterioration of the stone is caused by continual wetting and drying, erosion from water and wind, salt and pollutant ingress and spalling of the stone surface [4]. Sydney sandstone in particular will deteriorate within half a century of being cut from a quarry [4]. Thus, the conservation, including restoration, of Sydney Town Hall is vital and must be undertaken periodically.

The City of Sydney Council is currently working on the conservation of Town Hall, the sandstone for that project is being taken from the Public Works stockpile from McCaffrey's Quarry. This stockpile is rapidly being used up and it seems it will run out shortly, so a new active source of stone needs to be found. The stone used for the restoration of Sydney Town Hall must be of the best quality possible [5,6]. If the sandstone does not meet current Australian and International standards, the restoration work will deteriorate quickly and the sandstone will have to be replaced regularly. Thus it is vital that the stone used is strong and durable enough to withstand decades of weather effects. As the properties of Sydney sandstone vary significantly throughout the region, the analysis of the microstructure and physical properties is an important step to be taken prior to the opening or reopening of a quarry [7,8].

The problem of where to look for a new active source of sandstone for the restoration of Town Hall was thought to be solved in a yard owned by the City of Sydney Council. The yard is part of the old Saunders Quarries, known as Hell Hole Quarry, which may have potential to provide an active source for the much-needed sandstone. Quarrying in Pyrmont started in the 1840s, utilising this oxidising sandstone for many of the most famous sandstone buildings in Sydney [7]. Charles Saunders opened the Saunders Quarries in the early 1860s, and by the 1890s, this sandstone was known as the highest quality sandstone suitable for carving, being uniform in texture, hardness and colour [7,9]. The Saunders Quarries gradually became known as Paradise, Purgatory and Hell Hole, said to be named by the Scottish stoneworkers [7,10]. The Saunders Quarries were well-known for their quality of stone, which was exported interstate, to New Zealand and even to Fiji and Canada [11]. Buildings in Sydney which sourced their sandstone from Pyrmont include Sydney Town Hall, the NSW Art Gallery, the Queen Victoria Building and St Mary's Cathedral [7]. It is unknown whether any suitable stone remains nowadays. As Town Hall is built from oxidising Hawkesbury sandstone from the Pyrmont Quarries, it was thought likely that the sandstone from Hell Hole would be of a similar colour and geology.

The purpose of the investigation is to determine whether Sydney oxidising sandstone from the Hell Hole Quarry in the Saunders Quarries, Pyrmont, conforms to current Australian (AS/NZS) and International standards (ASTM) for dimension stone, as well as the more strict criteria specified by experts in the field of restoration of sandstone structures. As this quarry has not been exploited in 230 years, the state and character of the sandstone is unknown.

The tests that were conducted assessed the stone in regards to strength, durability and mineral composition. The tests included: bulk specific gravity (bulk density); water absorption; compressive strength; modulus of rupture; and resistance to salt attack. Petrographical analysis, utilising a Scanning Electron Microscope (SEM) to conduct imaging and perform Quantitative Evaluation of Materials by SCANing Electron Microscope (QEMSCAN) bulk mineral analysis, was also employed to characterise the microstructure of the sandstone. These results were also compared with previous research on Pyrmont sandstone.

2. Methodology

As mentioned above, the stone used to replace any existing damaged sandstone in a heritage building cannot simply be any sandstone. Not only does it have to match the fabric, history and culture, it must also be strong and durable enough to meet the Australian (AS/NZS) and International standards (ASTM) for dimension stone, as well as the more strict criteria for the restoration of heritage sandstone structures. Thus, the property characterisation test methods conducted were chosen due to their universal acceptance as standardised methods for the testing of sandstone to determine the stone's potential for use as a dimension stone. The results are therefore comparable with typical results from other sandstone quarries and minimum requirements for use in Heritage-listed buildings. The tests conducted included: bulk specific gravity (ASTM C97/M-09); maximum water absorption by weight (ASTM C97/M-09); average dry and wet compressive strength perpendicular and parallel to the bedding (ASTM C170/C170M-09); average dry and saturated modulus of rupture perpendicular and parallel to bedding (ASTM C99/C99M-09); and resistance to salt attack (AS4456.10-1997, Method A). The ratios of the saturated/dry compressive strength and modulus of rupture were also calculated (ASTM C170/C170M-09 and ASTM C99/C99M-09). Petrographic analysis was undertaken in order to

understand the microstructure and mineral composition of the material and to attempt to account for the way the stone responded in the property characterisation tests.

2.1 Material

The Hell Hole oxidising sandstone material tested in this study was supplied by the City of Sydney Council. The Hell Hole sandstone was quarried by the Traditional Stonemasonry Company, and cut into specimens and supplied by the City of Sydney Council. For absorption, specific gravity, rupture modulus, compression and soundness, 50 mm length cubes were cut and supplied. For rupture modulus tests, 200 mm by 100 mm by 60 mm beams were cut and supplied, while broken pieces of sandstone from the compression tests were used for petrography. Note that all tests were conducted over 8 weeks after coring, resulting in them being tested after the period of strength-hardening.

Good sampling is vital when petrographical analysis and property characterisation are undertaken, as only small pieces of stone are analysed [8]. These samples may not be a proper representation of the quarry, as sandstone properties differ between bedding and even laterally along beds [8]. In order to create samples which were representative of Hell Hole Quarry, the cores were taken from two areas along the west-facing cliff face. However, the exact location of each sample from these cores is unknown. This means that these two areas cannot be compared. This was assumed to be satisfactory, as this investigation aimed to understand the general nature of the stone from the quarry.

2.2 Standard Requirements

Each property of a stone has a requirement that needs to be met in order to be used for a certain application. The American Society for Testing and Materials (ASTM) prescribes internationally-recognised standards for sandstone dimension stones for use in buildings (C616-08). The NSW Department of Public Works also has certain requirements that need to be fulfilled in order for a stone to be adequate for restoration. These requirements are strict due to being solely for sandstone in NSW heritage projects [5]. Spry also provides requirements for a stone of good quality for NSW sandstone which can be used in all applications in industry [6]. Though these requirements are not specific to restoration, sandstone used in the restoration of Heritage-listed buildings needs to be of the best quality. This is because it is often used in overhangs or carved decorations; situations which place much stress on the stone [5]. Thus, these strict requirements are often used to assess stone considered for restoration. Table 1 below lists all the requirements mentioned above.

Property	Standard Test	International Requirements	Department of Public Works	Restoration Requirements
Bulk Density (t/m ³)	ASTM C97	2.003		Minimum, 2.2
Absorption by Weight (%)	ASTM C97	8		Maximum, 4 or 5
Dry Compressive Strength (MPa)	ASTM D2938	27.6		Minimum, 50 (best) 40-60 range
Wet Compressive Strength (MPa)	ASTM D2938	27.6		Minimum, 25 (best) 20-30 range
Wet:Dry Compression Ratio				Minimum 0.5 (best) down to 0.4
Dry Modulus of Rupture (MPa)	ASTM C99	2.4	6	Minimum, 8
Wet Modulus of Rupture (MPa)	ASTM C99		4	Minimum, 4
Wet:Dry Rupture Modulus Ratio			0.6	
Durability % Loss Salt Cryst.	AS/NZS 4456.10	Maximum 1% A grade		Maximum 1% A grade
Deleterious minerals				Limit as required; smectite, mixed layer clays, sulphides, zeolites etc.

Table 1: Comparison of properties of sandstone and their standards. Includes International (ASTM), NSW Department of Public Works and restoration standards [6].

3. Results

3.1 Property Characterisation

The results from the required property characterisation tests can be seen compared against the different requirements for sandstone in Table 2. As little to no property characterisation has been carried out on sandstone used in the structure of Town Hall itself, nor that removed for replacement due to degradation. Typical results for sandstone from the Pyrmont Quarries have been included in

this table as a means for comparison with the results from this study. As can be seen in Table 2, although a small number of the requirements were fulfilled, including bulk density, dry compressive strength and dry modulus of rupture, it is all too clear that the stone tested does not fulfil all the requirements for stone that is adequate for restoration. The stone generally fails in wet conditions, including absorption, wet compressive strength, wet modulus of rupture and durability.

	International Requirements	Department of Public Works	Restoration Requirements, Mean (Range)	Hell Hole Mean (Range)	Typical Pymont Sandstone Mean (Range)
Bulk Density (t/m ³) (Min.)	2.003		2.2	2.3 (2.2-2.3)	2.3 (2.3-2.4)
Porosity (%) (Max.)	8		4 or 5	5.0 (4.8-5.2)	(3.0-4.2)
Dry Perpendicular Compressive Strength (MPa) (Min.)	27.6		50 (40-60)	57 (52-60)	
Wet Perpendicular Compressive Strength (MPa) (Min.)	27.6		25 (20-30)	22 (19-29)	(13-31)
Wet:Dry Compression Ratio (Min.)			0.5 down to 0.4	0.39	
Dry Perpendicular Modulus of Rupture (MPa) (Min.)	2.4	6	8	9.2 (8.4-11.4)	
Wet Perpendicular Modulus of Rupture (MPa) (Min.)		4	4	1.9 (1.7-2.9)	1.7-4.3
Wet:Dry Rupture Modulus Ratio (Min.)		0.6		0.21	
Durability % Loss Salt Crystals (Max. for A grade)	1		1	4.5 (3.7-5.8)	0.6-2.2
Deleterious minerals			Limit; smectite, mixed layer clays, sulphides, zeolites	Trace of calcite found.	

Table 2: Comparison of Hell Hole sandstone results with typical Pymont sandstone with ASTM, NSW Department of Public Works and restoration standards [6]. Typical Pymont sandstone values taken from Spry [6].

3.2 Petrographic Characterisation

Though the Hell Hole sandstone samples from compression proved problematic for polishing due to their friability, the samples could be imaged as can be seen in Fig. 1. Although the surfaces are not flat, it was possible to identify the microstructure of the sandstone. The main constituent was found to be large grains of quartz, with an intergranular clay matrix. Quartz grains were angular and varied from 100 to 400µm. Mica was identified in the microstructure due to its characteristic sheeting, while iron oxide was identified due to its high density, which appears white in a backscatter electron image (see Fig. 1).

Bulk mineral analysis was conducted on the specimens from Hell Hole in order to identify the proportions of the mineral constituents which make up the microstructure of the stone. Rather than providing all of the mineral constituents, those which are deemed important by experts in the field of petrographical analysis of Australian sandstone are provided in Table 3, next to the published Pymont sandstone results from previous tests [7,8]. There are no standards for amounts of mineral constituents, but it is recommended that deleterious materials including smectite, mixed layer clays, sulphides and zeolites are limited. The only possibly deleterious mineral here is calcite, but as this is present in only a trace amount, it should not affect the properties of the stone. However, the lack of deleterious minerals does not directly mean that the stone is adequate for use in the restoration of Town Hall.

Fig. 1: Backscatter SEM image of Hell Hole Sample C64A.

Mineral	Hell Hole Stone Composition			Typical Pymont
	Mean (%)	Range	S.D. (%)	Range
Quartz	70.6	68.2-71.9	2.1	63-68
Clay, total	8.2	6.9-9.1	1.2	16-25
Siderite	1.2	0.9-1.3	0.2	2-6.5
Iron Oxides	1.8	0.9-2.7	0.9	0.2-4
Muscovite Mica	10.6	9.7-11.2	0.8	0-2.5
Feldspar	2.5	2.2-2.8	0.3	0-2.2
Calcite	tr	tr	-	n.d.
Carbon/Graphite	n.d.	n.d.	n.d.	tr-0.2
Minor Accessories [#]	0.5	0.4-0.6	0.1	-

Table 3: Mineral Composition of Hell Hole samples from QEMSCAN analysis compared with typical values for Pymont from a compilation of Spry and Franklin [6,8]. . tr = trace amount; <0.1%. n.d. = not detected. [#]Minor accessories include tourmaline, zircon, rutile/ilmenite, leucoxene.

4. Discussion

The purpose of the tests conducted was to determine whether or not the disused quarry known as Hell Hole could be exploited as a supply of oxidising sandstone for use in the restoration of Sydney Town Hall and other Heritage-listed buildings. It was expected that the results of the property characterisation for Hell Hole would fall somewhere in the range of results from earlier tests on Pymont sandstone, as given in Spry [6]. These results in Spry are representative of Pymont sandstone from 19th century buildings as well as stockpiled Pymont sandstone from more recent excavations [6].

As shown in Table 2, the property characterisation of the stone from Hell Hole demonstrated that although some of the requirements were met, the stone did not generally fulfil the requirements for stone used for restoration purposes. This is generally due to the stone's poor performance in saturated conditions. We will discuss now the importance of meeting these requirements.

4.1 Bulk Density

A dimension stone must have sufficient density in order to be sufficiently durable and strong to bear the weight of any courses above it. The bulk density of a stone used for the restoration of heritage buildings such as Town Hall must therefore be high enough to support such forces. The testing conducted on the Hell Hole sandstone resulted in a bulk density range of 2.2 to 2.3 t/m³ (mean, 2.3 t/m³). This bulk density was high enough to meet both the International standard (ASTM) as well as the requirement for restoration for Australian sandstone. As previously-tested Pymont stone resulted in a bulk density range of 2.3 to 2.4 t/m³ (mean, 2.3 t/m³), the density was almost identical to the expected value [6]. As a reduction in bulk density can be caused by physical weathering, it could be possible that the Hell Hole samples are slightly weathered, causing the bulk density to be slightly lower than typical Pymont values [12]. Despite possible weathering, the Hell Hole sandstone fulfils the bulk density requirement and is therefore acceptable for use in restoration in this regard.

4.2 Porosity

Porosity is a measure of the amount of voids in stone [14]. Porosity has both a direct and indirect effect on most of the physical properties of sandstone, so it is sometimes seen as the most important rock parameter [13]. A high porosity can demonstrate that a stone has a high resistance to water infiltration, and is thus safe from rising damp and salt attack [14]. As Pymont sandstones typically have a low porosity ranging from 3.0 to 4.2%, a similar low value was expected from these tests [6]. However, while the mean Hell Hole sandstone result of 5.0% easily passed the ASTM requirement of 8%, it only just met the restoration requirement of 4 to 5% (Table 2). Two of the samples had porosities higher than 5%. This higher porosity may be indicative of weathering of the stone due to its exposure on the edge of a cliff for 230 years.

4.3 Compressive Strength

Compressive strength is an important indication of the potential for a sandstone's use in the restoration of heritage buildings. The compressive strength must be analysed, as a dimension stone must have sufficient strength to bear the weight and forces subjected to it from the rest of the structure. It should be noted that the results from this study, as those from previous studies, provide results for strength where the force subjected is perpendicular to the bedding plane of the stone. This is because sandstone blocks are strongest when the force is perpendicular to the bedding. This is why they tend to be laid in a course with the bedding plane parallel to the ground; they have sufficient strength to bear the weight from higher courses. The response of sandstone to compression when tested parallel to the bedding plane is variable and unpredictable because the force acts directly along the bedding plane, which is weaker than the surrounding bedding. It was expected that the Hell Hole sandstone would have saturated compressive strengths ranging from around 13 to 31 MPa, in accordance with Spry's compilation of different properties for Pymont sandstone (Table 2) [6]. No results for dry compressive strengths have as yet been published and so there were no typical results to be expected.

As can be seen in Table 2, the range of wet compressive strengths fits directly in the range for typical Pymont sandstone. This means that the Hell Hole specimens are approximately of the same quality as the sandstone from Pymont which was used in Heritage-listed buildings and therefore, likely similar to that used in Sydney Town Hall. The compressive strength of the dry perpendicular specimens was much higher and also marginally more consistent than that of the wet perpendicular specimens. This was to be expected, as sandstones are strongest when dry and when the bedding plane is perpendicular to the loading [6]. The wet compressive strengths are less than half of the dry results. This shows that the compressive strength is greatly reduced by saturation of the stone with water. Loss of strength in the wet condition is possibly related to the clay content, which becomes soft during saturation and results in a reduction in strength [6,15].

As wet to dry ratios of sandstone are indicative of durability, sandstone with a high ratio is durable, while sandstone with a low ratio is not [14]. The failure of the stone in the wet condition resulted in a low wet to dry ratio: 0.39. As the ideal wet to dry ratio is a minimum of 0.5, and the lowest acceptable for dimension stone is 0.4 [6], it seems that the stone is potentially unsound and not durable, and is therefore not adequate for restoration [14].

4.4 Strength – Flexural Tensile Strength Modulus of Rupture

The modulus of rupture, being a method of assessing the tensile strength, simulates the real-life failure of dimension stones in a sandstone building [15]. Tensile strength is important to test, as sandstones are generally much weaker in tension than compression [15]. It was unknown what could be expected from the Hell Hole sandstone in terms of dry tensile strength, as only the results for the wet modulus of rupture of Pyrmont sandstone had previously been published in Spry [6]. The testing conducted on the sandstone from Hell Hole resulted in low wet tensile strengths, but relatively high dry tensile strengths. The dry tensile strength of the stone, with a mean value of 9.2 MPa, exceeded the minimum requirements of ASTM, Public Works and Spry's restoration guidelines [6], which were 2.4, 6 and 8 MPa, respectively (Table 2). The wet tensile strength, in contrast, does not meet either the Public Works or restoration requirements, with a mean value of 1.9 MPa, far below both requirements of 4 MPa (Table 2). Due to the poor wet tensile strength of the stone, the wet to dry ratio was also poor and far below the Department of Public Works' requirements (Table 2). This drop in strength from wet to dry indicates that the clay matrix is weak and that the stone may be susceptible to moisture ingress and strength variations [6,14]. This means that the stone is adequate in the dry condition, but as soon as water is introduced, the sandstone fails to meet requirements. The Hell Hole sandstone is therefore not recommended for the restoration of the façade of Town Hall in terms of tensile strength, as façades are constantly subjected to wetting and drying cycles due to the weather conditions in Sydney.

4.5 Soundness –Resistance to Salt Attack

The resistance to salt attack measures the durability of a stone. To be used for restoration in the Sydney environment, it must have sufficient durability to resist ingress of salt-water and pollution. The soundness test thus provides an indication of how well a sandstone can resist salt ingress. The deterioration of the stone in the sodium sulphate solution is due to the pressures in the stone caused by the crystallisation of the salts and hydration, which are stronger than the tensile strength of the stone. In a sodium sulphate solution, weathering is caused by the transformation of the dehydrated sodium sulphate into its hydrated form [16]. The deterioration normally results in a reduction of the dimensions of a stone block, generation of fine particles and weakening of the rock itself, which was seen in the tests conducted [15]. It was expected that the Hell Hole sandstone would have a similar mass loss as the typical range for Pyrmont stone found in Spry [6], 0.6 to 2.2%. However, the mass loss for Hell Hole was greater than twice this range (Table 2). This is most probably due to the weathered state of the stone, having a higher porosity and slightly lower bulk density than expected of a Pyrmont stone. This higher porosity indicates that more salt will be able to ingress into and crystallise in the stone than for fresh Pyrmont stone. As the best quality sandstone is needed for restoration, both Spry and ASTM dictate that the maximum weight loss in a stone used in restoration is 1% by weight [6]. Clearly, the Hell Hole sandstone does not meet this requirement.

4.6 Petrography

A petrographical analysis was conducted to understand the microstructure and mineral composition of the Hell Hole sandstone, and to understand its behaviour in the property tests. The backscatter images of the specimens from Hell Hole from this study clearly show that the microstructure of the stone is made up of angular to rounded quartz grains which vary in size from 0.1 to 0.4 mm, with a grainy intergranular clay matrix (See Fig. 1).

The mica, which can be made out by the characteristic sheeting, is bent and weathered, and the iron oxide is friable and weathered (See Fig. 1). There are also gaps between the quartz grains, possibly a result of the clay leaching out of the microstructure, but also possibly due to the polishing ripping the clay and other minerals out. The physical act of polishing the Hell Hole sandstone demonstrated that the stone was particularly friable, as the grains were simply ripped out instead of polished. This indicates that the clay matrix, which binds the stone together, is not particularly strong. The two compression test specimens that were used for petrography were not particularly weak compared to the other specimens in compression, so the friability cannot be attributed to this. In fact, specimen C07 had a dry perpendicular strength of 59 MPa, and specimen C64 a dry parallel strength of 54 MPa. These specimens had the second highest compressive strength for their condition.

The Hell Hole specimens from this study had higher quartz and mica content, but lower clay and siderite content than expected of typical Pyrmont sandstone (Table 3). These minerals have the most influence on the properties of oxidising sandstone, aside from detrimental minerals [8,21]. The high amount of quartz found in the Hell Hole specimens indicates that the Hell Hole sandstone has the potential to be stronger than most Pyrmont stone. This could account for the high dry compressive and tensile strengths of the Hell Hole sandstone, but may be also be a cause for brittle failure [8].

No deleterious minerals were found, save for traces of calcite, which should not affect the properties of the stone due to its small proportion.

4.8 Variances in Results

Variability is normal for stone; it can vary in properties significantly across a site [8,20]. Due to the sedimentary and diagenetic formation processes of sandstone, a small difference in elevation or lateral position can radically change the physical properties [17]. Unless the exact original position of the test specimens in the rock face is known, it is difficult to correlate results [17]. The variances seen in the results of this study are thus a result of the original location of the samples. The lower strength samples tested in this study were taken either closer to the surface of the cliff face, where more weathering occurred or close to the fault line, discovered during the drilling process, where a drop in sandstone quality may occur. With the property results in mind, the Hell Hole sandstone cannot be recommended for use in the restoration of Town Hall.

5. Conclusions

As demonstrated above, the sandstone tested from the Hell Hole Quarry was not of a high enough quality according to accepted standards to be used in the restoration of the façade of Sydney Town Hall. This means that the City of Sydney Council cannot turn to Hell Hole when the McCaffrey's stockpile runs out. However, it must be noted that the results from this study are limited by the original location from which the stone was taken. Tests were only conducted on stone from two places in the cliff-face of Hell Hole, so the results are probably not a real indication of the quality of the stone of the whole quarry. These locations were also at the same height from the ground and were most likely from the same strata. As Hell Hole was the deepest of the Pymont Quarries and it was well known that the best quality sandstone in the Saunders' Quarries was found deep below the surface of the stone outcrop [9], it is very likely that the higher quality stone is far below the current ground surface of the yard. Therefore, although the stone from this study was not of high enough quality, it is likely that the yard could reveal less weathered and higher quality stone for the restoration of Sydney Town Hall.

Another important point to ponder is whether or not sandstone used in the restoration of heritage buildings really needs to meet today's standards. During the construction of such buildings, there was no geologist on site to test the stone according to specific standards before it was used. Instead, the site supervisor simply had a general feel for what a good block of sandstone looked like to be adequate for use in construction. Sometimes, he clearly made a mistake, evidenced by the blocks that today need to be replaced. If such a stone is replaced with what is deemed a high quality stone according to the standards, it may be much stronger, less porous and denser than the stone that it sits between. If this is the case, preferential decay of the weaker original stones can occur, causing more damage, resulting in replacement of even more stone. With this in mind, it can be argued that there is a more appropriate standard to test the stone against than ASTM or restoration guidelines; the quality of the stone on either side of the stone block to be replaced. This would ensure that the stone used for restoration would not cause preferential decay.

Although the sandstone studied here cannot be used for restorative purposes, if it is deemed necessary to make use of this material in the future, it could be used for other purposes, such as dimension stone in domestic structures. The Hell Hole stone, due to its high tensile and compressive strength in a dry state with the bedding perpendicular to the direction of loading, could also be used in the restoration of interior elements of Heritage-listed buildings which are moisture free. Despite the sandstone from Hell Hole not being of high enough quality for exterior restoration, the results of the tests from this study are significant as they provide important data for comparison of the properties of sandstone from Pymont and the greater Sydney area.

Aside from the Public Works stockpile of oxidising sandstone from McCaffrey's Quarry, the closest quarry from which oxidising sandstone is currently used is Gosford Quarries [18]. There is no currently active quarry in Sydney itself, as the old quarries of Sydney were either exhausted or closed, filled in and built over [9]. Further research must be conducted into potential sites for new quarries or old quarries that could be reopened.

Acknowledgements

The authors would like to thank Geoff Brew, Matthew Sadlier and James Ginter for providing and cutting the sandstone required for the project and for their guidance during the research. Thanks must also go to Ian Bowie and Paul Connett for their guidance and Ross Barker and Mohanad Mursi for their help with experiments. The authors acknowledge the facilities, and the scientific and technical assistance, of the Australian Microscopy & Microanalysis Research Facility at the University of Sydney, especially Patrick Trimby.

Abstract

The research studies aim at assessing how the Neustadt (“New Town”) of Strasbourg has been built, perceived and interpreted at the local, national and international levels from 1878 to the present. It is progressively becoming a recognized and valued site, in particular since the 1950s. The present study emphasizes the ways in which the different considerations for this site both in France and in Germany influenced and changed its reception in order to make it part of the city’s heritage.

This architectural and urban site, built in Strasbourg between 1871 and 1914 under the German administration, will firstly be approached in this article as an architectural, urban and environmental object and secondly as bearing aesthetic, historical, technical, political, economical, cultural and social values according to different people since the end of the 19th century - population, tourists, institutions, politics, professionals, historians, press, etc.

The major interest of this study lies in the possibility it offers to consider the heritage process in a multicultural context, in which different influences interact as much as they distinguish themselves in the concrete and physical space, the architectural and urban territory, and at the same time in the intangible field, enlivened by collective consciousness.

Keywords: Neustadt – Strasbourg – Architecture – Heritage – Reception

1. Introduction

The research project which we will introduce here is incorporated into the interdisciplinary study “Genèse et réception de l’architecture et des formes urbaines dans une région frontalière (1850-1950)” launched in 2010 and conducted at the University of Strasbourg by Alexandre Kostka and Hervé Doucet. This program officially phased out at the end of 2012. Nevertheless, a number of research projects of the same nature still continue and grow. The research group is getting bigger and new experimental fields are being discovered and explored.

Originally the project brought together architects, historians, specialists in German studies, sociologists and linguists in order to work on the architecture and urban forms that emerged between 1850 and 1950 in the border region of the upper Rhine overlapping France and Germany. Therefore, two main axes – that are still relevant in the current research – have been defined. On the one hand, researchers work on the genesis and the context of the construction of architecture in the border regions of Alsace and Lorraine. The political context of the period and the choice of architects – who passed through different kinds of educations in Germany and France – are, among others, details which are at the centre of the analysis. On the other hand, the reception and the perception of the architecture are the focus of investigations. Therefore press articles, magazines devoted to architecture, novels, interviews and other kinds of texts are explored in order to capture the reactions, opinions and feelings of the public towards the architecture and the constructions in question.

In the following article a concept of a fruitful combination of two scientific perspectives, a cultural-historical approach and a sociolinguistic approach is presented. Benefitting from the fact that both authors live in Strasbourg and work on the same project, the idea to realize an interdisciplinary approach out of the respective works, will be presented.

First, the object of our research – the urban area of the Neustadt in Strasbourg – will be presented. Therefore the genesis of the urban extension in its cultural and political context is briefly demonstrated with a plan layout. Following the introduction will be a discussion of the notion of reception and possible points of contact with a theoretical framework in view of our project. Next, we will present an interdisciplinary approach by demonstrating initially the two respective perspectives before we accomplish them in the subsequent chapter. Eventually we demonstrate our first tendencies concerning the reception of a particular building – the Emperor’s Palace – in the past and the present using examples of discourse material which we compare and analyze. Finally we’ll present further research perspectives.

2. The conception and construction of the Neustadt

The Franco-Prussian War, opposing Napoléon III and Wilhelm I, started on the 19th of July 1870. The city of Strasbourg was bombed by some 200,000 shells during the siege that lasted from the 13rd of August to the 28th of September 1870. Even the cathedral, whose construction was launched when the city of Strasbourg was part of the Holy Roman Empire, was hit. The structure of the roof was damaged and the finial of the spire tower was unhinged.

The reconstruction of buildings and bombed-out neighbourhoods started the first year of annexation in 1871. This program was a way for the German Empire to dress the wounds inflicted upon the newly annexed territories.

Stemming from the will to expand and to modernise the fortifications, the urban extension project of Strasbourg finds its origins in the military ambitions of the German Empire to ensure the stronghold role of the border city. The new surrounding wall, approved by the *Reichstag* – the *Reichstag* was, from 1871 to 1918, the Parliament of the German Empire – in 1877 and completed in 1882, defined the new limits of the regional capital.

The urban design, defined by the urban extension, also constituted a political project. It aimed to create a window to the German sovereignty, and to the power beyond the frontiers of the Empire. The objective was to provide the city with dwellings, notably for the population coming to germanise the city, mainly military servicemen, notables, public figures, industrial workers and civil servants.

Berlin asked two architects to work on the urban plan, August Orth from Berlin and Strasbourg’s city architect, Jean-Geoffroy Conrath. The two architects provided their projects in 1877. A draft was also proposed by a third architect, Hermann Eggert, responsible for the plan layout of the University.

An exceptional commission of experts from France and Germany was organised between the 18th and the 23rd of September 1878 to discuss the projects. It was mainly the project of the Alsatian architect Conrath, respecting the old city ensemble and offering parallelepiped blocks, easier to build, that would be carried out.

The discussion concerning the urban plan expansion notably dealt with the disposition of the *Kaiserplatz* (current *Place de la République*) - conceived by August Orth in the continuity of the axis Kléber-Brogie – and was suggested in a symmetric way on a large slab covering the canal. The city architect, Jean-Geoffroy Conrath, proposed, on the other hand, to locate the Emperor’s square at the intersection of two major axes: the first one turned towards the University, of which implantation is already determined before the urban plan, and the second one being the visual perspective between

the Schiltigheim Gate (current *Place de Bordeaux*) and the cathedral, allowing a delicate seam between the old city and the urban expansion (Fig. 2). At the intersection of these two axes, the circular garden of the *Kaiserplatz* aims to canalise the traffic.

Fig 2: The *Kaiserplatz* (current *Place de la République*) - Copyright: Sophie Eberhardt

The urban plan (*Bebauungsplan*) of the Neustadt constitutes the program implemented in Strasbourg. Officially approved by the *Bezirkspräsident* of *Basse-Alsace* on the 7th April 1880, it expands the surface area of the city of 386 ha, passing from 232 ha to 618 ha (Fig. 3).

Fig. 3: *Bebauungsplan für die Erweiterung der Stadt Strassburg* (urban planning of the city of Strasbourg), Jean-Geoffroy Conrath, Strassburg: Schultz, 1880 - Copyright: Archives of Strasbourg (Brb 1561)

The *Bebauungsplan* constituted a working tool that anticipated the building's location by establishing the housing scheme according to the density, the type of buildings and the functional zoning. The official buildings were organised around a monumental avenue linking the administrative ensemble, embodied by the *Kaiserplatz* - current *Place de la République* – with the Emperor's palace – current *Palais du Rhin* -, the Assembly palace – current *Théâtre national de Strasbourg* – the two ministers – current *Préfecture and Service général des impôts* – and the imperial library – current *Bibliothèque nationale et universitaire* – to the centre of knowledge symbolised by the University.

3. Theoretical frame: the definition of "reception"

After having presented the object of investigation, we will now discuss possible points of contacts with theories linked to perception and percipience of architecture. A definition of the idea of « reception » is mentioned in a quotation by Walter Benjamin in its essay *The Work of Art in the Age of Mechanical Reproduction* published in 1936:

Architecture has never been idle. Its history is more ancient than that of any other art, and its claim to being a living force has significance in every attempt to comprehend the relationship of the masses to art. Buildings are appropriated in a twofold manner: by use and by perception – or rather, by touch and sight. (p. 240) [1]

From the excerpt of the « diverted perception » of Walter Benjamin to the considerations of institutional, professional and civic fields, the study of the reception aims at revealing the senses and values granted to buildings. It shows the cultural, ideological, political and social dimensions that architecture and urban spaces embody all along the centuries and according to the people, which are conveyed through images and symbols. By a subtle cross-influenced exchange, these interpretations have an effect on the place of buildings in the collective consciousness. These considerations can also pertain to the increased status and the validation of architecture and urban spaces to the “heritage” status.

In order to understand the Neustadt and its reception, we have chosen to proceed to the analysis of discourses about the site - and particularly a selection of buildings of the district – found in written sources. For example the building files of the Archives of Strasbourg, the Histories of Strasbourg, travel guides and travel pieces, architectural and urban planning reviews, interviews and public-opinion polls.

The content of historical sources, put in perspective with the observation of the ornaments and the architecture and urban spaces, allows reconstituting the intentions at the origin of the realisations of the Neustadt - the way(s) the primary contractor and the architects apprehended and orientated the interpretation of the public - and the reception at the time. The survey (Dahm 2012) [2] allows finding and analysing empirical knowledge on the basis of social and cultural representations.

The analysis of the discourses further allows for the evaluation of the parallels and distances between the intentions of the primary contractors and the builders, how those took shape materially, and the visions of the public, according to their historical, ideological, cultural and social background.

Within the framework of our research project the reception is hence considered as the discrepancy between the intentions (the program) of the primary contractors and the architects, their anticipation of the reception, and the real and concrete reception of the realisations in time, embodied in the discourses and the interventions on the buildings.

The theoretical framework of the research is also rooted in the literary approach “*Rezeptionsästhetik*”, founded by Hans Robert Jauss (*Literaturgeschichte als Provokation der Literaturwissenschaft*, 1967) [3] and further developed by Wolfgang Iser (*Der Akt des Lesen*, 1976) [4]. This approach engages the cognitive and emotional perception of art - including architecture. From a literary perspective, the concept constitutes a change in paradigm of the reading of literary works, placing the reader at the heart of the production of the work.

The study of reception also includes a sociological and hermeneutic perspective, which aims to question the general approaches applied for the study of architecture, mainly relying on restricted analysis of techniques and practices in the field. The approach, which we present here, encompasses the interpretation of works and discourses, including their immediate understanding, their appropriation in history, and the effects that the interpretations have on the works themselves.

4. Context of the research: cross-disciplinary approach

As exposed in the introduction and the first chapter of this article, our research concentrates on the Neustadt of Strasbourg which constitutes a considerable and well preserved part of the architecture on the upper-Rhine that emerged between 1850 and 1950. Our goal is to combine the analysis of historical and contemporary texts and discourses in order to understand what kind of representations and values have been attributed to the Neustadt from the second half of the 19th century until today and how these representations changed and developed in the course of the 20th century.

Both approaches function for themselves with their respective methods and theoretical frameworks. When crossing the two perspectives we need to redefine the methodological framework towards an interdisciplinary and comparative approach. In order to combine the two approaches we will briefly expose their inherent particularities in the next two chapters.

4.1 Cultural historical perspective

In the framework of the cultural historical approach the perception of the Neustadt will be explored from the end of the 19th century until today while considering possible links and bonds that exist with the perception of the old town, the so-called “*Grande-Île*” – a UNESCO World Heritage since 1988. Eventually the construction of today’s heritage site and the identification of its cultural, historic and social values are in the centre of the investigations. The images and representations that were created in France and in Germany concerning the urban extension of Strasbourg contributed – throughout the course of the 20th century – to the perception of values attributed to the heritage of this district. The main interest of the historical approach lies in the consideration of the mechanisms of the construction

of heritage from the end of the 19th century until today – when images were shaped and unshaped in the border region of Alsace-Lorraine.

In order to analyse the developments and processes that contributed to the creation of representations, text sources of different kinds and from certain periods will be analysed. One major aspect is the reception of the urban extension project by specialists in the field of architecture and urban planning. These considerations and statements can be found in specialised French and German magazines like *Deutsche Bauzeitung*, *Zentralblatt der Bauverwaltung* and *L'Architecture*, which were created at the end of the 19th century – at a time when the Neustadt had already been constructed. But also the daily press of that time reveals interesting insights into the topic and the reception on behalf of the public. Other crucial sources are the publications *Histoires of Strasbourg* and books dealing with the architecture and urban spaces of the city. In addition, travel texts of local personalities such as Louis-Eugène Seinguerlet [5] but also known writers such as Gérard de Nerval [6] and Victor Hugo constitute a relevant source of information. Moreover French and German tourist guides from different epochs reveal crucial facts about how the imperial district of Strasbourg has been perceived. The guides we have consulted are *Baedeker*, *Joanne* – current *Guide Bleu* – and *Conty*. Eventually, discourses of historical monuments can be found in the archives. Those texts represent a corpus which is at the center of the cultural-historical approach.

4.2 Sociolinguistic perspective

Within the scope of the sociolinguistic approach, the analysis of a sample population's social representations of the former imperial district of Strasbourg will be in the centre of the investigation. The concept of social representations is an epistemological option so as to apprehend the reception of the quarter. The way in which it is used in our research should help us to understand the collective and individual perception of the participants of our survey towards the Neustadt.

This concept has its origins in the fields of sociology and social psychology and goes back to Emil Durkheim who, by the end of the 19th century, marked the notion of “collective ideation” (Schmaus 1994: 183) [7]. Durkheim thought that the process of the creation of representations is a collective one and therefore a social experience [8]. Furthermore, he developed the concept of “social morphology” in order to explain the material form of social phenomena. In this way, Durkheim emphasized the importance of the consideration of material substance when investigating and analysing the social world. Seen from this perspective, any kind of built architecture is considered a manifestation and a result of social products and exchanges (cf. Schroer 2009: 21) [9].

Further developed and re-thought by the social psychologist Serge Moscovici [10] in the 1960s, the concept of social representations made its way through other fields in the humanities. In the study of the Neustadt, we will eventually combine – in the form of a triangulation – a social psychological perspective with a linguistic perspective of the concept of social representations.

According to Bernard Py [11], whose concept represents a rather linguistic perspective of social representations, representations are created during a conversation. They are mentioned and then they arise and are modified. Therefore, the analysis of discourse material seems to be an adequate way in order to identify and to investigate pertinent elements which are associated with the German quarter of Strasbourg.

Social representations can appear in different forms and sometimes are analysed in an isolated way. They can, for example, take the form of a stereotype (“cette architecture marque bien le style allemand qui est fort et bien carré”), an opinion (“monumentale, et puis il me fait plutôt peur son architecture”) or an informative element (“je le vous disais, ce n'est pas allemand, c'est l'architecture d'une époque répandue dans toute l'Europe centrale qui a moins existé en France”). These elements have in common, that they all refer to the respective object and therefore to reality (cf. Jodelet 1989: 53) [12].

Apart from the material collected in the context of the historical approach, we dispose of another text corpus which consists of transcribed interviews. Those texts are the results of a survey which we conducted in the Neustadt in 2012 during the course of a sociolinguistic study (Dahm 2012) [2].

In the context of the sociolinguistic approach, and contrary to the historical approach, we analyse discourse material which is contemporary and not historical. It arises from interviews which we conducted with inhabitants of the city of Strasbourg and therefore reflects the current (2012) reception of the passersby. Until now, we have at our disposal the transcriptions of 80 short interviews (with a length of two to seven minutes). In the near future, the corpus will be enlarged with 8 to 10 semi-directive in-depth interviews and the methodological structure is currently being changed and improved. The research design of the 2012 survey, which was marked by a hypothetic – deductive approach, will be revised in favour of a more empirical-inductive proceeding in order to construct new hypotheses out of the collected material.

The four questions asked during the study focussed on the identification of the elements in the district that are perceived as being German. Furthermore the qualities that people associate with the Neustadt were made an issue. The reception of one of three concrete buildings (*Palais du Rhin*, *Palais*

des Fêtes and *Bains Municipaux*) was the theme of the third question. What the participants thought about the fact that an apparently German architecture (constructed during the German administration) might be labelled as a French UNESCO heritage was asked in the fourth question.

The aim of the sociolinguistic approach is to analyse the content of these and more interviews in order to categorise and interpret them. In the course of a discourse analysis we'll try to identify the social representations which reside in the material: How are these representations structured? How are they distributed? Are they dynamic and do they differ a lot from each other or are they rather consolidated and recurring?

Social representations, as Denise Jodelet [12] points out, often belong to and are joined to cultural, ideological and other bigger systems, not least to the current scientific knowledge of a specific field. She further highlights that certain institutions and authorities as well as communication networks play a very important part in their creation, stabilisation and manipulation (cf. Jodelet 1989: 52) [12]. If we think for example of the role accorded to the touristic guides of Strasbourg, it becomes evident in what way they might have influenced the process of stabilisation and distribution of certain social representations of the Neustadt.

5. Combination of the two approaches

When we brought together our findings we were very interested in comparing the outcomes and in detecting and identifying the first tendencies that would arise out of the analysis. Therefore, we concentrated on our discourses that deal with three public buildings in the Neustadt: the Emperor's Palace (*Palais du Rhin*), the former singer house (today *Palais des Fêtes*) and the City Baths (*Bains Municipaux*). We started to detect and to collect discourse material (empirical and historical) that deals with these three buildings.

After a first content analysis we could carve out certain tendencies in the reception that seem to be valid and significant for the historical as well as the empirical material. In combining the historical with the sociolinguistic approach we are able to analyze the reception of the Neustadt throughout a specific period of time and from different points of view. Moreover this comparative method allows a very profound view on our data since we can try to reconstruct the development of certain representations from the past till today. What people think of the quarter, of a certain building and its architecture, can be compared to what the public or subjective point of view was like, for example, before the Second World War.

At the very least the comparative approach enables us to examine the deviation that exists between the intended force and effect wanted by the constructors and the actual reception of the quarter by the public.

6. Representations of the Neustadt: first tendencies

We will now have a look at some discourse extracts from the historical material and from the interviews. After a first analysis of the text material – in which we focused on the reception, opinions, beliefs and attitudes concerning the three buildings (*Palais du Rhin* – Emperor's Palace -, *Bains Municipaux* – City Baths -, *Palais des Fêtes*) – three pertinent tendencies have emerged out of the discourses. Due to article size restrictions we will concentrate mainly on one building: the Emperor's Palace.

At first we came across, what we call, the “**monumental character**” of the Neustadt and its architecture. This trend shows up, often with a kind of ferocity from the end of the 19th century until today. Starting from the intentions of the builders, the *Kaiserplatz* was realized as a symbol of German modernity and excellence within the framework of nation construction in Europe. The massiveness of the institutional realizations was aimed to impress, in order to establish the new sovereignty. After the Second World War, when the animosity between France and Germany was at its height, Paul Ahne wrote in *Strasbourg 1850-1950, métamorphoses et développement* published in 1959: “Quant au fameux Palais du Rhin, construit un des premiers en 1886 pour l'Empereur Guillaume I^{er}, c'est un parfait exemple de démesure, d'un effet déplorable (...)” (p. 29) [13]. The impression of the Palace as a perfect example of exorbitance and immoderateness is not only resented by locals. Some decades later, in 1981, Annemaria Giusti asserted in her book entitled *Strasbourg*: “Le palais du Rhin se distingue par sa construction énorme et imposante sur la place de la République, et s'inspire des édifices berlinois de style néo-Renaissance.” (p. 58) and, by referring to the constructions in Berlin, stressed the “triumphal” hallmark of the building (p. 62) [14].

When we look at the answers given during the interviews (Dahm 2012) that we conducted in front of the former Emperor's Palace, the association of this building with a monumental character turned out to be crucial [2]. To the question: “Please describe the building in front of us. What are the words, the adjectives that come to your mind when you look at it?” the participants gave diverse answers. Alongside positive statements like “beautiful [...] historical”, “c'est un beau bâtiment” and “ça fait toujours un peu rêver [...] ça fait travailler l'imagination”, the answers were predominantly connoted

with a rather negative impression which seems to be associated with a monumental and imposing character: “massif et un peu pompeux”, “imposant [...] une architecture assez particulière”, “son architecture me fait plutôt peur, elle me rappelle une mauvaise époque de l’Allemagne”, “on sent que quelqu’un veut imposer”, “impérial, monumental”, “monumental [...] relativement esthétique”, “[...] on arrive à voir [...] la rigidité de l’esprit allemand et ça traduit bien les caractéristiques de, comment dire, de simplicité, d’efficacité”, “une architecture qui dégageait de la puissance et de la prestance [...] c’est le témoin d’une époque” [2]. Those statements reflect the participants’ attitudes and representations towards the former Emperor’s Palace. Words like “imposing”, “heavy”, “massive”, “powerful” and “impressive” reflect what we refer to as the monumental character. The prodigious hallmark mentioned in these cases is very often attached to the “German style”.

Concerning the second trend, that we could carve out and that we call the “**German character**” of the Neustadt, we found interesting material, too. In 1987, Théodore Rieger and Georges Foessel wrote in their book *Strasbourg, Deux mille ans d’art et d’histoire*, that the Emperor’s Palace was marked with Bismarckian pride (“tout hérissé d’orgueil bismarckien”), referring to the building as the “Elephantenhaus” (p. 74), which was the term coined by Wilhelm II at the end of the 19th century [15]. Robert Durand de Bousingen, in the book *Strasbourg, urbanisme et architecture des origines à nos jours* published in 1996 mentions an “imposing germanity” and a “foreshortening of the German history” (p. 242) [16].

Similar tendencies, the excess and heaviness, can be recognized when we have a closer look at the discourses extracted from the interviews. When we analyse the interviews conducted in front of the Emperor’s Palace (Dahm 2012) we can see that the participants of the survey partly associate the architecture of the building with a “German character”: “c’est un peu lourd je trouve, mais voilà, c’est allemand”, “on arrive à voir [...] la rigidité de l’esprit allemand et ça traduit bien les caractéristiques de comment dire, de simplicité, d’efficacité”, “chargé d’histoire quand même [...] ça symbolise un peu le lien franco-allemand”, “c’est de l’architecture allemande, donc les cariatides, pierre de taille, les sculptures de force, les colonnes” [2]. The building radiates a kind of massiveness and ponderosity as we can learn from the answers. One of the participants thinks of the notions rigidity, simplicity and effectiveness when looking at the facade. At the same time he associates those words with what he calls the “German spirit”. Moreover, sculptures that radiate strength, columns and caryatids are named in order to describe the German character.

The German character as well as the monumental character seems to have in common that they activate similar reactions on the part of the interviewed persons. The fact that the palace radiates some kind of heaviness for the participants seems to be closely connected to the fact that the architecture had been built under German administration (“c’est un peu lourd je trouve, mais voilà, c’est allemand”). The fact that the building is charged with history is mentioned, too. Therefore the former Emperor’s Palace seems for one of our participants to emblemize a kind of French-German bond (“chargé d’histoire quand même [...] ça symbolise un peu le lien franco-allemand”). Interestingly, the Palace seems also to have kept its primary symbolic power – as the political centre of the German administration in Strasbourg – since a participant of our survey mentions that the architecture lacks in some kind of facileness and therefore appears imposing: “ça manque de légèreté [...] on sent que quelqu’un veut imposer”. The aura of the building is described as being imposing. For one participant the building radiates something angst-inducing: “son architecture me fait plutôt peur, elle me rappelle une mauvaise époque de l’Allemagne”. This very last citation, as others too, reveals the fact that the architecture is often brought in connexion to the French-German history. But often, as other results of our survey show, the participants are not able to contextualize the origination of the Neustadt correctly. During the time of the German Empire – when the Germans made Strasbourg their showcase in a westward direction – the French-German relations were other than after the Second World War. The latter seems however to have a strong impact on the reception of the architecture which has already been constructed by the end of the 19th century, namely the Wilhelminian style. The brutal history has, as we can see, left its marks on the perception of the architecture.

The third tendency we could deduce out of the discourse material – and which seems to be valid for both the historical material and the interviews – is what we named the “**criticism of the eclectic architecture**”. This trend becomes obvious in the historical texts written by architects and professionals, particularly until the 1970s and 1980s. Before that time, experts and researchers in architecture and urban planning rather despised the eclectic character of the architecture in the Neustadt. Recently, and especially within the framework of the elaboration of the application of the Neustadt for the inscription on the World Heritage List, the historical and heritage value of the entire district is being better documented and highlighted. In his book untitled *Strasbourg du passé au présent*, Philippe Dollinger refers to the Emperor’s Palace in 1962 as being a Neo-Florentine pastiche: “un lourd pastiche néo-florentin, dépourvu de tout attrait et rendu massif encore par la surcharge de la décoration” (p.65) [17]. In the author’s words the massif and surcharged building is lacking any kind of appeal and impulsion.

Some decades later, in 1996, Robert Durand de Bousingen, in the book *Strasbourg, urbanisme et architecture des origines à nos jours* acknowledged the heaviness of the building conveyed by the historical style, asserting that the Emperor's Palace represents a successful application of historicism architecture: "son imposant avant-corps, son dôme et sa décoration ostentatoire, le palais impérial n'est certes pas un modèle de légèreté, mais un bel exercice de style éclectique teinté d'influences florentines et antiques." (p. 242) [16].

Not only experts recognise the eclectic aspect of the Neustadt. The juxtaposition of different architectural styles also strikes the interviewed passersby of our survey: "ben, ça s'inscrit dans l'architecture en vogue à cette époque alors il y a certains bâtiments qui sont de style néo, par exemple l'immeuble à Gallia c'est néo-renaissance allemande, d'autres sont néo-gothiques", "il est dans le style typique historiciste de cette période que l'on trouve en gros de Strasbourg et au bout de l'Europe centrale", "il y a une architecture typique de la période allemande du début du XXème" [2]. Different architectural styles like neo-renaissance, neo-gothic and historicism – typical of the first construction period of the Neustadt – are mentioned. One person recognizes that the style of historicism can be found in other parts of central Europe. The contextualization of this urban site and its eclectic architecture however is not clear without ambiguity: "Pour moi ils ne sont pas très allemand [les bâtiments], il y a quelque chose bien plus allemand que ça, pour moi ça reste français". In a way this statement reveals the eclectic character of the architecture. On the one hand the architecture of the Emperor's Palace consists of eclectic elements. On the other hand, the reception of the building on behalf of different people has an eclectic character as well since some of our participants define what they see as German, others as French architecture. However, the existence of different architectural styles next to each other seems not to be inconvenient for the participants of our research since they do not evaluate this fact as something negative or un-aesthetic. The complex character of the Neustadt recognized by our participants becomes clearer when we also consult the results of the sample of interviews that we conducted in front of the *Palais des Fêtes*, the former singer house: "les constructions sont un petit peu massives, mais finalement [...] c'est très proche des immeubles haussmanniens de Paris qui n'ont rien à voir avec le quartier allemand". In this citation the person clearly separates the architecture around the singer house from German architecture since he sees a close connexion and similarity to buildings in Paris. Contrary to his point of view, another person sees a similarity to the buildings which were constructed around the Emperor Palace. In this context, terms like "massive", "imposing" and "solid" are named: "l'architecture est proche avec celle qu'on peut trouver vers la Place de la République [...], massif, imposant, solide et espacé". As eclectic as the architecture of the Neustadt may be defined by experts, its reception by the passersby seems to be equally eclectic and diverse.

7. Further research for the future

Now that we have started our project, we will have to go further with the analysis. We will have to look for more text fragments that reveal information about the reception of the three buildings in question. Since the scope of our historical sources is vast (literary texts, tourist guides, architecture magazines from the turn of the century) we will need some more time to filter the pertinent elements out of the texts. In our next step we'll have to continue to enrich our database with this material that we'll have to classify.

In order to enlarge the empirical material we will conduct a new survey. About ten in-depths interviews with chosen contemporary witnesses – who lived in Strasbourg in the 1940s, the 1950s, the 1960s and the 1970s – will be prepared in the next few months. After the transcription of the semi-directive interviews, in which we will place impulses and keywords in order to trigger positioning on the part of the participants, we will continue a content analysis to find out more about the structure of the social representations associated with the former imperial quarter of Strasbourg. Furthermore we'll have to define and specify the theoretical and methodological framework in order to allow a fruitful content analysis.

Since representations may appear in the form of stereotypes, attitudes, opinions and informative elements, we'll try to classify the diverse declarations. We will also have a closer look at the differences of the variable and the stable characters of the cultural and social representations and try to establish a kind of map that gives us an overview of the solid and widespread, as well as the more flexible representations of the Neustadt.

Using an inductive approach analyzing the discourse material we will try to create more hypotheses directly out of the material in order to test them and to adjust them with the historical material in the comparative approach.

8. Conclusion

In this paper we introduced the first tendencies of our research project aiming at identifying and analyzing the cultural and social representations associated with the Neustadt of Strasbourg all along the 20th century. The results allow stressing the importance of intangible material, which is the result of

the reception of architecture, in the process of building and heritage construction. The cross-disciplinary approach allows for the consideration of the dynamic character of social and cultural values and helps to overstep the restrictive description of buildings rooted in artistic considerations. The tendencies that we could find in the historical texts reflect in a certain way the social representations of the participants interviewed today. We targeted certain continuities in the creation and the structure of the social and cultural representations associated with the former "Imperial district" of Strasbourg: a monumental character, a German character and a criticism of eclectic the architecture.

Nonetheless, the data analyzed in the present article is not sufficient and representative to describe the reception of the overall quarter. The results conveyed do only concern the most emblematic building of the imperial program - namely the Emperor's Palace - and cannot be extended to the entire Neustadt, especially as the vast surface of the district does encompass a wide range of architectural styles and a moving urban planning scheme. Moreover, we are still at the beginning of our research project and we need to adjust our methods and theories.

While further research concerning cultural and social representations linked with other buildings of the Neustadt will help to detect the values recognized for the urban ensemble, and to understand how those values were ranked at the "heritage" status, the social representations associated with the Neustadt might help to gain a better insight of the current reception of the entire district. Since in the next interview series which we are preparing for we will not focus on one specific building, but try to capture the representations of the entire district, we might get a better picture of the reception of the Neustadt as an urban ensemble.

Abstract

Declared World Heritage cultural property in 2005 by the UNESCO, House Batlló is considered one of the most poetic and decorative works of the Catalan artist Antoni Gaudí. The refurbishment of the house, realized since 1904 to 1906, is based on: the widening of the internal patio, a new façade at first and second floor, the design of the roof and the functional distribution of the residential space.

In the unique design of the House we can identify some principles of modern buildings refurbishment: it's interesting how Gaudí achieve comfort performances through the application of these building technologies, aimed to reduce overheating in summer period. The cladding "trencadís" gives a specific aesthetic language to the building and contributes also to improve thermal mass and reflectance of the envelope. The distribution of flat around the indoor courtyard and new design of windows (both road and inside façade) develops a passive system of ventilation. This approach, which can be assimilated to the modern "environmental design", contributes to improve the energetic efficiency and indoor comfort. This study wants to improve the connection between the "technical intuition", expressed by Gaudí in his historic context within the refurbishment of Batlló House, and our modern approach, through the technic and legislation on energy retrofitting. This research leads to a thought of the Catalan architect that is as much deep as synthetic: "La originalidad consiste en volver al origen, y este origen es la Naturaleza como creación divina"[1].

Keywords: environmental design, bioclimatic architecture, Antoni Gaudí, trencadís, free cooling.

1. The main project: the Batlló House

House Batlló, located in the *Passeig de Gràcia* 43 in Barcelona, was declared as a UNESCO World Heritage Site in 2005, and its listed on the treasures of Barcelona by IBOCC, the International Bureau of Cultural Capitals, in 2008.

The urban context was designed by the engineer Ildefons Cerdà and approved in 1859 by the Spanish Ministry of Development. Cerdà draws up a topographic plan to develop this new area, the *Eixample*, purpose-built to host the middle class, moving from the oldest area of the city, the *Barri Gòtic*, after the demolition of the walls in 1854. The peculiarity of Cerdà's project was the planimetric organization, composed by octagonal districts, where all the buildings were designed with a depth of 28 metres and two façades: one on the street and the other in the inner courtyard of the block. The shape of streets and the positions of buildings creates a particular microclimatic conditions in relationship with the wind and the different orientation of buildings and façades.

Antoni Gaudí was commissioned, in 1904, to modernise the apartment block owned by the textile industrialist Josep Batlló i Casanovas. Gaudí starts from a simple redistribution of spaces, to create one of his most complete, inspired and poetic, artistic compositions. Particularly the renovation is realized by the enlarging of the interior courtyard of the house, the demolition and rebuilt of lower level, up to the first floor, the adding of two more floors, the crowning of the roof and the re-design of the external walls, with a wavy shape that gives to the house an original and fantastical façade. (Fig. 1-2).

Fig. 1: Façade of the House Batlló before and after the refurbishment of Gaudí, and sketch of elevation for the building remodeling 1904-1905.

Fig. 2: 1- Photo of the House Amatller. To the right there is a part of the House Batlló before the work of Gaudí. 2- Photo of Batlló House, 1906.

The Gaudí's work is not the only example in the prodigious plan designed by Cerdà: in this area there are unique works of architect-engineers such as Lluís Muncunill, Josep Puig i Cadafalch and Lluís Domènech i Montaner. The works of these masters, real *gesamtkunstwerke*, are distinguished, as well as a refined decoration, in line with the other contemporary architects like Guimard, Horta, Sullivan and Wagner, for an all-out experimentation that leads to innovative technological solutions, both in the details of decoration and finishing that in the structures.

In Batlló House it is possible to identify a plus-value that derives by Gaudí's capacity to go beyond the simple decorative language with his practiced eye. Every stylistic choice (from the design to the internal organization of flats, to the decorative elements) shows his sensitivity using passive systems to achieve indoor comfort for Mediterranean climates. In many works of Gaudí it is frequent to find refined regulation systems of solar radiation and the use both of natural lighting and ventilation: all those principles are now defined by the European and national regulation.

The specific study of plans and sections of his projects identifies a common scheme, where the spaces are enlightened correctly to satisfy the indoor comfort of users. In Batlló House it is possible to find this organizing principle in the central common courtyard (visible especially in the sections) that is similar to the traditional style of the Mediterranean "casa con patio" (Fig. 3).

Fig. 3. Batlló House. Plan of the principal floor and transverse section through rebuilt stairwell with the color blue is shown the patio, also in part visible in the photo.

To fully understand this design approach it is important to outline some essential climate information, about the house Batlló and his position for appreciate the innovative technical solutions adopted by the Catalan architect. The building, as we have already mentioned before, is located in Barcelona, at latitude N 41° 23' 29,43" – E 2° 09' 53,39", in a climatic area B-W (UNE 240445/6).

The weather in Barcelona is characterized by a Mediterranean climate, with wet and temperate winters and hot, humid summers, typical in Catalonia. In winter, temperatures are between 8 and 11 degrees Celsius with a 55% relative humidity (RH); while in summer range is between 23 to 25 degrees and 68% of RH.

After analyzing the technical data about the specific climate of the area we can proceed to examine the important recovery strategies of the Batlló House. In the specific we can be divided into three categories: the use of *trencadis* in façade, that improve the energetic behavior, the expansion of

internal staircase, with the enlargement of new windows (indoor and outdoor) and the new concept of top floor (skylight) to create a passive system of ventilation. Is possible find an advance of our energy regulation in those different strategies; UE and Italian regulation, indeed, is based on use of technologies and spaces, to reduce the energy consumption: this approach lead this design in our time, like one of the first examples of energy retrofiting

2. The trencadis: energetic analysis of the “new” envelope

The trencadis is one of the most characterization aspects of Batllò architecture: this technique is a type of mosaic realized with ceramic fragments, scrap or by white china cups and plates, joined together through a binder, usually mortar. Full of symbolism in all Gaudí works, the trencadis becomes an important part of energy performance both envelope and building in agreement with modern regulation.

Indeed the Italian regulation on envelope design solution define the energetic performance through the imposition of U value (transmittance), mass and thermal lag. At the same time it's possible identify a bottom to top approach, that develop different systems of eco-labeling inside the construction market: this increase the diffusion of other indicators, like solar reflectance index (SRI),[1] based on thermal emittance (E) and solar reflectance (R).

In this section we want analyze the Trencadis through this indicators, to identify the real increase of performance in “new” envelope of Batllò House: to simulate the energetic behavior we use the UNI EN ISO 6946:2008. The energetic simulation are made by Termus-g (ACCA Software) and Calc311 (TermoK8). The SRI share is identified by application of ASTM E1980 - 11 standards, adjusting the insolation value to use in vertical surface.

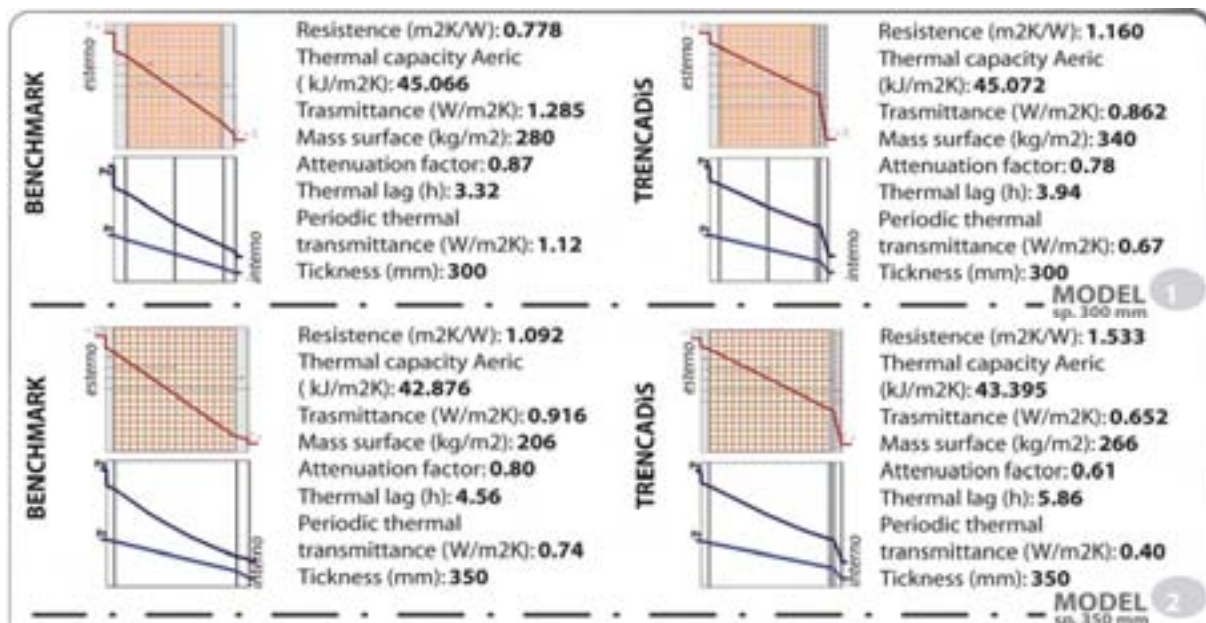

2.1 Performance simulation of wall: transmittance, mass and thermal Lag

In order to identify the improving of envelope we take as benchmark the simple curtain brick wall, plastered on both side: due to movement of wall we use four different thicknesses between 30 and 42 cm. The calculation models of technical solution are based on energetic performance of material defined by specific sector literatures: plaster and curtain brick wall are defined in UNI-TS 11300 standards. The performance of trencadis layer is identify by the interpolation of data between tiles and plaster, in relationship with the covered percentage in one sqm: this aims to considerate inside the calculation model the real composition of trencadis. The broken tiles, used to create the mosaic of envelope, are put in place by the use of binders, this create a continuous grid where it is possible identify a performance variation.

Indeed to simulate the performance of trencadis we adopt this value:

- Tickness: 30 mm (including the system of laying)
- Thermal resistance: 0,46 (sqm*K)/W
- Surface mass: 46 Kg/sqm
- Heat capacity: 900 J/(KW*K)
- Permeability: 3,45 (Kg/msPa)*10¹²

From this data it's possible define the “trencadis” layer usable in the calculation model: the simulation aims to compare the thermohygrometric performance of the benchmark with the actual envelope.

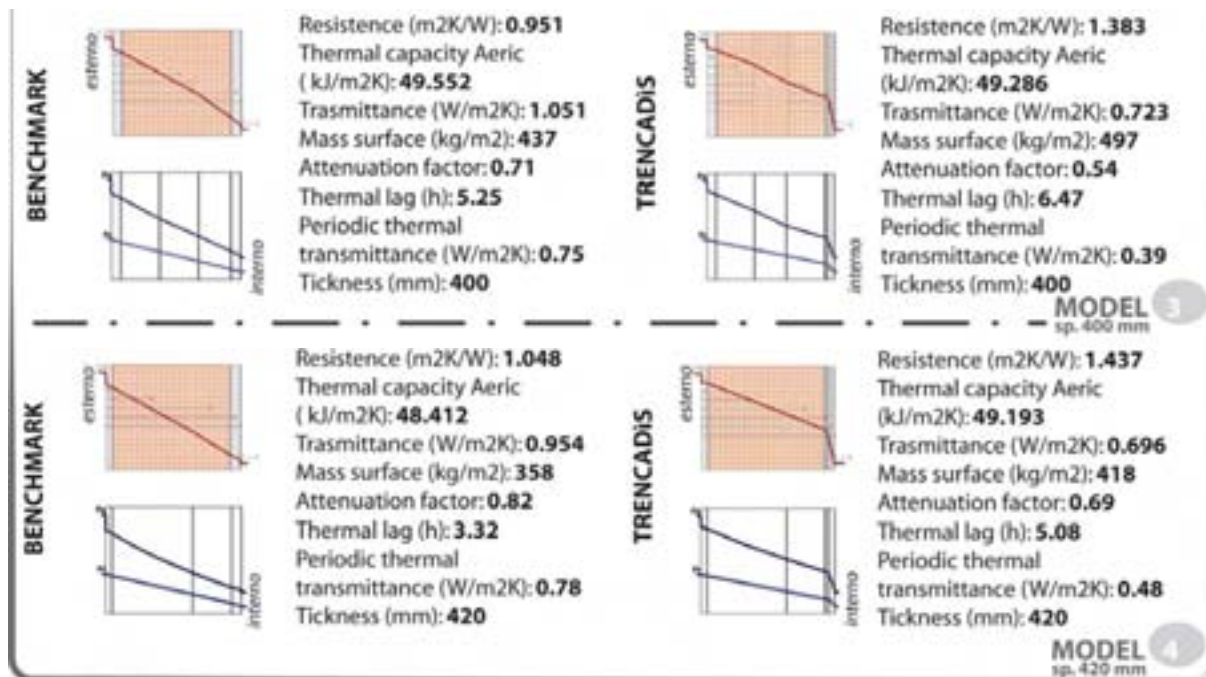

Fig. 4: 1-4 comparison data between plaster curtain brick wall (benchmark) and the “new” envelope of Batlló House (trencadís): the output data derive from an averages of results of Termus-g and Calc311

The output data define an interesting increase of envelope performance in relationship at his energetic behavior: the first aspects regard the resistance, that increase, on average, by 43%. This define a development of performance mainly in winter season, although it represents the greater improvement, it's also the less interesting value in relationship with the problematic defined by climate condition of Barcelona. The second aspects concerning the performance in summer periods: with the use of trencadís the thermal lag increase about by 29%, and mass surface by 19%.

In practice, this improves the capacity of building to soften the thermal wave, by shifting the perception of peaks of heat inside: the mass surface reducing the fluctuation of indoor surface temperature, that contributing to comfort. This effects it's also amplified by the nature of the material: the tiles of trencadís create a cool effects on façade, entirely similar to “cool roof” theory.

2.2 Solar reflectance index (SRI) of trencadís

The solar reflectance indicates the material's ability to don't assimilate the solar radiation. In urban area indicate also the capacity of building to reduce the local heat-island and, at the same time, improve the envelope energy performance in summer period. The SRI value is a rapport between thermal emittance, the ability of materials to give off absorbed heat, and the solar reflectance (albedo), that makes up the power to ruminate sunlight. It's adopted 100 the comportment of perfect white color and 0 for the black: this performance is subject at the quality of the surface finish.

The Trencadís SRI it's an important factor to understand the summer behavior of envelope: the tiles indeed have a very high albedo, thanks to reflective finish typical of tiles, but the thermal emittance it's in relationship with the color. Furthermore in this technique the blinder (white) cover a parts of surface and improves the performance.

To identify the real value we have studies one smq of trencadís to identify the percentage both binder and broken tiles: the binder covered around 30% of surface. It's possible assimilate this parts whit the performance of rough white surface, like plaster.

Fig. 5: percentage covered by blinder in the trencadis of Batllò House façade.

The value adopted are:

- Binder: emittance 0,88; albedo 0,9
- Tiles: 0,60; albedo 0,95

The SRI value of trencadis is 114: this output, assessed through the LEED and GBC certification, defines a optimal behavior of wall, in relationship with the criteria SS (sustainable site) and the reduction of urban heat-island.

3. Natural ventilation: courtyard, windows and doors

The organic aesthetic of Batllò House goes beyond the decorative view to define both functional and technical aspects: with the refurbishment of the building is created a natural ventilation system, where the design of new elements contribute to achieve the summer indoor comfort.

As seen, Batllò House orientation and the contraposition of façades creates an ideal situation to take advantage from natural cross ventilation. With this aims Gaudí improves all his buildings activities: in the new design of windows (both front and back façade) and internal doors, it's possible identify a manual control mechanism for open/close a ventilation wooden grid, integrated in the frame, that allows to take the fresh air from outside in safety (intrusion, animals, etc..). Those grids permits to regulate the intensity and direction of cross ventilation, and represents a remarkable technological provision by Gaudí. In this first approach it's possible identify an anticipation of two modern concepts: night free cooling and adaptive comfort.

The adaptive model is based on relationship between humans' behavior and the thermal expectations and preferences: today ASHRAE Standard 55-2010 states that the presence of control point wide the range of temperatures tolerated by users.

Fig. 6: Batllò Ventilation system: windows, doors and the courtyard create a natural ventilation based on thermoventilation and pressure difference

The ventilation grid is also presents in the internal windows: in this case its used to extract the hot exhaust air from the flats to the courtyard that become the core of ventilation system, where, once time again, it's possible find the mix up of aesthetic and technical of Gaudí's work. In the new courtyard, indeed, Gaudí use the color and material of trencadis to give the aesthetic of continuum dream journey, but at the same time turn the courtyard in a solar chimney, through the use of dark colors to the top, that increase the local temperature. He uses the summer sun to improve the extraction of hot air from the flats: the high temperature in the top of courtyard expands the air that, lighter, go out from the opening of skylight. At the same time the vacuum created, draws the air below and structured a complete ventilation system jointly with the windows grids and some tubes that cooling the external air (from *Passeig de Gràcia*) through the passage in the basement. This approach is the combination of two variants of natural ventilation: thermo ventilation and pressure difference, both system improve the ventilation generated by sea breezes.

4. Conclusion

In conclusion it's possible classify the refurbishment of Batllò house like one of the first energetic retrofitting in Mediterranean climate: but Gaudí go beyond this, and changes the point of view.

In his design the function and technical aspects are merge with the aesthetic language, transporting the users in a new world. The environmental intuitions, now all coded and regulated, are not perceived as an addition, but parts of the design language: through the use both trencadis and ventilation, the house become a complete integrated system where is impossible identify singles bioclimatic components, but find a complete and amazing architecture.

[1] Originality consists in returning to the origin, and this origin is nature as God's creation

[2] In the LEED labeling we can identify the use of SRI like indicator in the SS area (sustainable site) in relationship with the inclination of roof: the SRI factor is representative to reduce the urban heat-island effect.

Abstract

The Italian historic architectural heritage includes a special and widespread category of buildings: the fortresses. Fortresses characterized for centuries the image of many Italian towns and landscapes and their presence modelled their urban or rural settings. Today these military buildings have lost their original function and very often create difficulties in current urban policies, in consideration of their dimensions, their collocation and the high costs for their preservation. As consequence, they are often in critical conditions of conservation and they have been frequently transformed in empty spaces disconnected from the current city life. The better way to protect these huge architectures consists in a long-term planning of sustainable reuse. Obviously these structures cannot be used to fulfill their original military functions and their peculiar architectural features clash sometimes with actual needs. It is necessary to study each structure according to its environmental, social and cultural contest to facilitate its best reconversion. The use of multimedia instruments suggests a method to reach satisfactory results but also it engenders some questions and doubts. The goal of this paper is to analyze the problem of fortresses today and to explain some meaningful cases of reuse in central Italy. Particular attention will be paid to the fortress of Verrucola near Lucca. This is an emblematic case study both for the choices of restoration and new display and for the difficulty to select new functions.

Keywords: fortress, preservation, reuse, 2D and 3D technologies.

1. Section. The reconversion of Italian fortresses: criticalities and examples

Fortresses are a huge architectural historic heritage made up of buildings of different types located in strategic urban and suburban areas. These types of buildings were erected in particular historical contexts and lost their original function after political changes and the transformation of military techniques. The loss of the original function has caused the abandonment and neglect of these buildings. After their abandonment, the military complexes slowly began to decay. This abandonment is a phenomenon which has involved fortresses in different historical periods. Since the nineties the Military State Property Administration has been selling its unused or useless properties [1].

Today these places live the paradox of the perception which the local communities have always had of them. In past times they were inaccessible, militarily top secret, perceived with strong symbolic and identifying values; today they are empty boxes, without a meaning yet still full of appeal.

The emptying of their functions has generated hypotheses regarding the functional reuses of fortresses and military areas in general. These complexes, which are buildings within walls or squares,

are often a combination of open and closed spaces and can generate different processes of urban requalification [2].

Their functional reuse (that is their transformation into buildings with new uses different from the original ones) and the urban or suburban requalification around them subvert their original role: from an inaccessible military area the fortress becomes a place reused for civil purposes acquiring social and cultural functions.

The term "reuse" does not necessarily mean giving economic functions to the historic buildings, but attributing new productive functions which aim at the social development of their context.

In every case it is necessary for the functional reuse plan to be compatible with the historical features of these complexes, to which it is important to attribute functions coherent with general urban planning. It is evident that a historic building cannot be reused on the basis of designs which jeopardize their preservation.

In reuse planning a key factor is the analysis of local needs, which can have residential, cultural and social values. The answer to those needs corresponds to the desire to generate common areas where people can live.

In order to understand the current transformations or what may happen in the near future, it is important to look back to recent past times. After the loss of their original role, many military buildings were reused with various functions. The case-studies are more numerous if we distinguish between the transformations which have involved fortresses located in urban areas and those located in suburban areas.

Suburban fortresses often had harsh destinies, as in many cases they were difficult to reach, difficult to maintain and difficult to reuse. So many of these became henhouses, vegetable gardens, storage rooms, private gardens. Many cases are reported in archival documents. An example is the fortress of Verrucolo in Garfagnana near Lucca, which was used as a vegetable garden until 1980, when it was acquired by the Municipality of San Romano in Garfagnana.

Nowadays some of these military areas - abandoned between the XVIII e XIX centuries - have new roles within a more general context, which includes landscape, cultural and historical values.

In the case of fortresses or military buildings located in urban areas, their presence has been sometimes perceived as bulky and as a barrier to urban city planning. It has been difficult to make their reuse compatible with current social and cultural life.

In some cases fortresses were built after the demolition of existing urban fabric. This created discontinuity. The fortresses seem to be integrated perforce within the city conquering areas which today relegate them to a marginal role. After losing their original function, it was difficult for these fortresses to find a new role. A significant case-study is the fortress of Leghorn, a huge historical box which is again in a state of decay as it is difficult to give it a new cultural vocation or a new social connotation.

These empty areas can be filled with new values, new meanings and new activities and can become the object of re-appropriation by local communities. In reuse planning, it is necessary to answer a few questions regarding the functions compatible with these fortresses.

How can historical complexes with such defined and exact features be used? What role can the fortresses have within the local cultural and social fabric? What functions are compatible with their historical features? What forms can the functional reuse have? The answers to these questions are the solutions to some criticalities which arose during the abandonment of these fortresses. It is necessary to understand if an abandoned military box can reply to social and cultural needs, what impact its reuse can have on the city, how much its maintenance cost, what type of management could be applied, what economic resources could it stimulate, etc.

One of the criticalities concerns the size of these complexes, which are huge, and for this reason a lot of money is necessary in order to promote their restoration and functional reuse. Due to the current crisis, the chronic lack of economic resources does not allow owners (both public and private) to carry out a uniform planning; the interventions are often fragmentary and concern only certain parts of the complexes.

Another criticality is represented by the contemporary additions. In some cases the adaptation to new functions needs integrations or new additions to the existing buildings; as a result architects must have the skills and awareness needed to guarantee the respect of their historical features. In other cases it is possible to requalify without building and give more emphasis to open spaces than to closed ones through the planning of new areas open towards the city. In all cases the requalification of these complexes, carried out traditionally or through the introduction of contemporary features, has to be planned within the general territorial development program and it is necessary to involve public and private resources from the very beginning. Functional reuse should be a common choice, compatible with the peculiarities of the places. Reuse could help new values to emerge by defining a strong liaison with social urban fabric.

The less invasive functions or the functions which requires fewer transformations are usually those with a cultural intent. The adaptation of these empty areas to cultural aims has become widespread,

but such adaptation should be strengthened; on the one hand this is useful, while on the other hand it has generated superficial restoration projects planned by public administrations which want to transform these buildings into cultural boxes at any cost. This planning has resulted in the restoration of these complexes and their transformation into empty boxes filled by occasional cultural events such as exhibitions, shows, conferences, etc.. These occasional uses do not help their enhancement or maintenance. Some historians correctly believe that cultural reuse (in particular museographic reuse) is a non-choice, an easy choice due to the lack of interest in designing concrete functions for historic buildings. Reuse is a social and common practice in order to introduce an empty monument in living urban context and to avoid its transformation into a museum. This kind of use is perhaps the most difficult way of heritage enhancement"[3].

The reuse of abandoned areas must open new opportunities of intervention which can offer to the city new requalified and functioning places, new occasions of enhancement and economic development, an improvement of cultural, environmental, physical and ecological conditions [4].

The choice of a new function and the development of a coherent design are the first steps in order to preserve a huge historical complex. The buildings which are not restored and reused suffer decay, lose their functions and their deep values. The changes in their functions, even if very different from the original ones, allow the building to live again within its context; the reuse must be planned in respect of its history and its historical features and must be "sustainable, autonomous, compatible and recognizable" [5].

The definition of new functions related to these types of buildings requires a study of their transformability features. The starting point is a deepened architectural study in order to highlight the features which need to be respected and enhanced. The data is necessary to create a correct balance between preservation and transformation; it could also be used at different scales in order to promote regenerating processes regarding the buildings and their urban/suburban context. This data can also activate creative processes of enhancement of the same buildings.

The main criticalities about the reclamation of fortresses shown above are three: 1) the size of the buildings and their economic management problems; 2) the way to add new structures to these ancient buildings; 3) the effectiveness of cultural reuse. On the basis of these criticalities we have selected three case studies: the Rocca of Narni (Province of Terni), the Castle of Formigine (Province of Modena) and the Fortress of Verrucola in San Romano in Garfagnana (Province of Lucca).

These examples are evidently without demanding completeness, and they do not wish to express value judgments on the single choices made by the administrations which currently own the buildings. They merely want to compare different typologies of 'cultural' reuse, think about the potential of the fortresses and the identity and peculiarity of their social and topographic environment, show the difficulties involved in a renovation project and generate new questions.

This small selection of buildings is carried out according to certain parameters:

- public property of buildings;
- location in north-central Italy;
- large size;
- historic, architectural and documental interest, but no presence of art collections or decorated rooms of special artistic interest;
- functional recovery plan devised in the last 15 years;
- proposal of using information technology and multimedia instruments with the aim of enhancement and broad fruition.

Each building represents a different way of looking at cultural recycling. In our brief analysis we will speak about the benefits and doubts regarding the use (or not use) of information technology and how the latter can benefit the public, both citizens and customers.

We will begin our analysis starting from the Rocca of Narni, located in Umbria. It is a large fortified site, built in the second half of the 14th century by Cardinal Egidio Albornoz (Fig. 1). It was for years a residential and military building used by popes and cardinals. In 1999 the municipality of Narni, which became the major owner of the building together with the Province of Terni, decided to insert this fortress into a structural and functional restoration project thanks to European Community funding. The size of the building implied great economical responsibility for the public administration; the choice regarding its cultural destination has to take into account urban, economic and social planning.

The financing was used to restore the structure and also to buy several electronic devices (big screens, computers, softwares etc.) – according to some "without any exact and oriented project" – and the purchased material was left for years in the wine cellars of the Rocca [6]. In 2003 the municipality of Narni entrusted the management of the Rocca to the "LightArchitecture" company, which should have carried out certain activities related to promotion, services, planning and organization of exhibitions and events. The "LightArchitecture" is a company which promotes a large use of information technology and the idea of a 'Media building', that is the enhancement of a building as a space in which the future society of information can communicate [7]. The engage of this

company would have been able to transform radically the traditional methods of fruition of the Rocca. However, in 2004, after the inauguration of the fortified site, this company suspended all activities. In 2012 the municipality gave the management of the building to the 'Rocca of Narni company' which inaugurated within the Rocca a thematic 'Medieval Park' [8]. An imaginary 14th century village was reconstructed and animated by costumed characters which carry out several educational activities or trade typical products. The idea is not original but attracts visitors interested in folkloristic features. The large part of activities are carried out outside the Rocca. The paths regarding to the restoration of the building are located only there. Inside, few rooms house the modern reproductions of some medieval objects: dresses, musical instruments, arms, armors etc. These objects are not explained with any panels. There is not an itinerary to explain the true history of the castle and this kind of exhibition confuses visitors. A large room, equipped with long tables, is rent out for weddings and birthdays (Fig. 2). The Rocca also houses a little shop of false medieval gadgets, a café and an auditorium. In substance, these activities allow the building to live but a question arises: is it enough to requalify a building in a social and cultural manner by offering temporary exhibitions and various other events (planned periodically) or is it necessary to create an enduring exhibition itinerary within the building itself? The Italian experience confirms the incapacity of managing a historic building from an economic point of view if it is only an empty place used for spot-events without a cultural and economic long-term planning [9]. Another question: is it possible to reuse a building only in an evocative sense, through an imaginary thematic reconstruction without historical and architectural in-depth analysis? If it was the case, it would be possible to apply a standard, interchangeable and permanently reproducible model of reuse to all historic buildings and fortresses. Historical, architectural, archeological, anthropological and social studies instead represent the principal feature of diversity and individuality of each building and this cannot be ignored.

The well-known Castle of Formigine near Modena is quite different (Fig. 3). It was restored by the architects V. Vandelli and D. Biondi between 1999 and 2006 and its restoration began with an accurate study of the structure [10]. It was carried out thanks to in-depth historical and archaeological research, metric surveys, chemical and physical analyses of materials, stratigraphy and decay mapping. These structural and archeological studies were carried out by the University of Venice in collaboration with the Universities of Modena, Reggio Emilia and Bologna and thanks to public and private funding. The municipality of Formigine offered most of the financing, but the Emilia-Romagna Region, the Istituto per i Beni Artistici, Culturali e Naturali of the Emilia-Romagna Region, the Province of Modena and the Fondazione Cassa di Risparmio of Modena also gave substantial financial aid.

Thanks to the involvement and coordination of these institutions the architectural restoration was carried out correctly, but in other cases financial problems often prevent restorations from being carried out properly. In the case of Formigine the funding was the result of the collaboration of various authorities interested in taking part in a project of local and national importance. In the preliminary phases of this reuse project serious evaluation of management practices useful for the new function of the castle was done.

The museographic choice was to open the castle to the public and offer various services. The building spaces have been organized to house rooms for the mayor and the city council, this choice links the building to its original institutional function; a restaurant-bar; meeting rooms, space for symposiums and temporary exhibitions; finally, a museum and documentation center (both focused on archaeological findings) and a multimedia and sensorial itinerary created by the 'Studio Azzurro' art center [11].

In the castle there are not art collections or particular decorative features, but thanks to the reuse planning this large and empty space currently represents a good example of preservation and shows how the history of a building can help its enhancement process. In this case the use of multimedia tools is the result of an alternative choice to the traditional museum paths.

The 'Studio Azzurro' work increases the value of the whole recovery plan. It aims at connecting visitors and objects/spaces and creating interactive systems to experience with different perceptual effects. It also allows the interaction between several levels of fruition, both the multimedia fruition (characterized by movies projections, virtual windows, acoustic and perceptual effects etc.) and the classical fruition (characterized by the use of few but significant objects and slim and fluid panels).

In the last 15 years the idea of the sensorial and interactive museum has been applied in our country, but not enough because of its high costs. The goal of this kind of interactive equipment is to captivate the visitor-spectator with its active experimentation and to allow him a large freedom of movement within spaces and narrative itineraries.

As a result the revitalization plan of the castle won the praise the Italian Institute of Castles thanks to the quality of the architectural restoration and the enhancement of public fruitions and functions.

The Emilia-Romagna Region is highly knowledgeable regarding the study and enhancement of fortified sites of its territory and the creation of projects and touristic circuits [12]; it has also supported the development of the Formigine reuse plan and this marks an important point in this venture.

But there's a doubt: how long will this kind of interactive and multimedia applications last? It is necessary to consider the consumption and decline of information technology tools, which require periodical maintenance and updating, the continuous changes of the customer desires, the progress of computer science. Will do these set-ups lose their communicative function? We think they do not. Probably we will wait for their transformation into an 'historical' kind of fruition, at the moment it is one of the most suitable to enhance empty buildings which have lost their original functions (not only fortresses, but also palaces, churches, monasteries etc.).

The last case we will expose is the Fortress of Verrucole in San Romano in Garfagnana, near Lucca (Fig. 4). This fortress was built by Gherardighi family of Lucca in 11th century and it was transformed into a military garrison by the Este family. After the loss of its military function, the fortress was abandoned at the end of 18th century and it became a private property at the end of the 19th century. In 1985 the fortress was purchased by the municipality of San Romano in Garfagnana, which since 1992 has begun a project of restoration and enhancement funded by public contributions. Before the restoration plan, an archaeological campaign was carried out inside and outside the fortress. A lot of materials were found, they were compared with archival research and used in order to recreate the history of the area [13].

The building was in deep decay and needed significant architectural integrations. The restoration was directed by the Florentine architect GianClaudio Papisogli Tacca and it was carried out step by step with many stops and ongoing changings. The first plan was approved by the Soprintendenza of Lucca, but during the long-lasting works it was transformed due to the lack of funds. As a result the restoration was different from the expectation; some choices are not convincing such as the integrative and 'philological' principles of restoration. In particular, new additions to the fortress are objectionable: a new stone level was added in the Round Stronghold; a new floor was built, new windows were opened and the floor was covered by a circular metallic roof. This intervention has generated new usable areas, but some doubts arise. The original ideas of covering the building with a prismatic glass roof and the use of light materials with a modern design has been abandoned because of the lack of funds. The alternative project of covering the fortress was based on the 'philological' copy of a 16th century design by the Este architect Marcantonio Pasi. Anyway, this historical design is not sufficient to justify scientifically the choice of rebuilding the fortress according to some historical features. The historical design does not have metric references and represents the fortress at an exact and short moment of its life. As a result the current reconstruction is not properly in accordance with the current methodologies of architectural restoration.

During the restoration plan of Verrucole, which was completed only in the summer 2012, the main question was how to reuse the fortress. The municipality of San Romano and the architect Papisogli Tacca decided to transform it into a documentation center regarding castles and fortresses located in ValdiSerchio. The idea was perhaps inspired by the example of Formigine, whose castle has been transformed into a documentation center regarding castles in the territory of Modena.

As a result the museographic set-up of the round stronghold of Verrucole has been divided into two parts. The ground floor houses the description of the history of the fortress and the evocative reconstruction of its spaces (prison, kitchen, bathroom etc.); on the first floor the large round room, completely rebuilt, houses a big table, three computers and six panels with the descriptions of the military art and history of some castles around the fortress of Verrucole (Fig. 5). Initially an auditorium and a documental center were planned, but not realized. Unfortunately, inside the stronghold there are not a library or a bibliographic corpus dedicated to the history of the territory, neither comfortable workspaces for research and consultation. In a room of the castle of Formigine three multimedia chests offer various and diversified information about the building construction, restoration, new set-up, while in the fortress of Verrucole the multimedia information is incomplete and less communicative. Despite of the good-faith of the public administration, the choice of the cultural reuse has been in this case the easier choice and, in this form, the cheaper one.

This choice of cultural function could be efficient only if all the municipalities of the ValdiSerchio will support a common design in order to enhance their fortified sites. In the past this agreement didn't come, we hope it will be reached for the future. Consequently, the fortress of Verrucole is currently a restored and partially set-up building, but empty of its true cultural intents.

Until 2011 the entrance to the fortress was free, while today the municipality of San Romano has introduced a ticket and offer guided tours on appointment. The building does not match the functions for which it was restored. The choice of the documental center also overlaps another choice made by the municipality some years ago, that is to set-up the archeological evidences found in the fortress and currently located in the city library. A local library and a little museum already exist in the urban center of San Romano in Garfagnana; they are more comfortable, accessible and equipped buildings and people prefer usually go there than in the empty inaccessible round stronghold. Thus the documental and museographic intent of the project is losing its value.

Compared with the castle of Formigine, located in the city center, the Fortress of Verrucole is placed on a rocky spur, far from the city and not easily accessible. This is an evident and objective limit to its

exposure and fruition which the municipality has to consider. However, the isolation of the building could become a form of attraction, if the territorial municipalities will elaborate common activities in order to enhance their fortified sites.

Thanks to its incredible naturalistic context, the Fortress of Verrucole could be considered the place of destination, the finish-line and the refreshment area for some sportive activities such as trekking, mountain-bike, excursions, which could engage several castles in Val di Serchio. Simultaneously inside the Fortress some multimedia equipment could be projected in order to show the connection of the building with the territory and the other castles. A multimedia low-cost proposal, less sophisticated than Formigine's one, but coherent with a possible revitalization plan of Garfagnana territory, is that we are going to display.

2. Section. The fortress of Verrucole as a case-study

The medieval Fortress of Verrucole is isolated from urban center and castled on a hill about 600 meters above sea level. Today this location, which at one time has placed the fortress at the center of the history of Garfagnana, creates the need for more attention during the documentation step and the conception, analysis and implementation of a plan for its use and enhancement. Currently there is a wide range of different technologies that can help during the study activities of the building and the dissemination of results to a broad audience, either experts or common users. For the documentation phase of the Fortress of Verrucole it would be possible to make 2D and 3D acquisitions with photographic device and scanning systems [14]. In particular, the use of three-dimensional technologies would allow to create 3D models in order to document the structural geometry state of conservation and support the restoration plan [15]. Moreover these data combined with architectural and historical information would allow us to show the evolution phases of the fortress through animated virtual environments and narrative models. We would have several ideas to promote this fortress and all aim at creating new thought-provoking systems. The limit is that the restoration of the historic building has already been completed and we could only create a low-cost tool in order to enhance the fortress by keeping in mind the current set-up. Three touch-screens have been placed in the centre of the large room on the second floor and they could be used together with some projectors in order to create a virtual vision of the surrounding territories and castles, which are not visible from the fortress (Fig. 6). The work is meant to represent an alternative to the traditional museum visit by mixing the history of the fortress with history of the surrounding area. The final goal is to provide an interactive system that allows to communicate and visualize the historical contents easily and to complete the information of the panels located within the room around the multimedia station.

In the past centuries the fortress has dominated the valley, the Apuane Alps and the Apennines, and was part of a network of castles and medieval villages of the Garfagnana. Therefore, we designed a 2D digital tool that would allow to re-contextualize the Fortress of Verrucole within the territory and make the history and culture of the place known. We created a panoramic image, which enables the user to view a full 360 degrees the landscape and to get history information (Fig. 7). In particular, a photographic campaign was made in the surrounding area of the fortress. After creating the panoramic by aligning the different images (Fig. 8), it has been integrated with information and historical photographs regarding the Garfagnana's castles visible during a virtual navigation. These data are easily accessible in interactive way and give a direct communication to the visitor (Fig. 9). This digital result could be enriched with multimedia contents by adding music and audio in order to stimulate the different sensory perceptions and also to be an aid tool for knowledge of the cultural heritage by people with disabilities. Obviously the Virtual Tour can be implemented and made available to more levels of detail. Currently, the obtained result is not accessible from the multimedia stations, but the technology used allows the user to access it on the web (<http://artosalva.isti.cnr.it/en/virtual-visits-verrucole-garfagnana>).

Abstract

The area of Campi Flegrei can be considered as an open-air museum of ancient history. It represents a cultural and natural heritage of great significance which is based on environmental values and on historical memory of the places, that is tangible in many vestiges of the past.

The entire area is marked by great archaeological sites, but also by a widespread presence of minor archaeological ruins on which overlies contemporary urbanization.

This unusual condition, where archaeological sites and modern constructions coexist, makes the territory unique, where the ancient and the contemporary, along with the particular natural environment, characterized by the presence of ancient volcanic craters, defines a cultural landscape of inestimable value.

The knowledge of this extraordinary heritage can contribute to determine a process of local development. It is therefore possible to give a positive impulse to local economies only if there is knowledge, awareness and capacity to attribute meaning and value to cultural experiences.

The paper intends to explain an ongoing research concerning the knowledge of the archaeological and environmental heritage of the territory, carried out through the survey of archaeological ruins and of all significant evidences of the ancient and actual urbanization and through the definition of a data base serving an interactive map in order to create cultural connected paths, to diffuse knowledge in network between local communities and therefore stimulate development policies.

Keywords: Cultural Heritage, Archeology, Survey, Drawing.

1. Investigation and Knowledge for promoting cultural heritage

In recent programs of protection, conservation and enhancement of cultural heritage, architectural survey plays an important role not only in order to study the specific monument, but also to discover the relationships with the surrounding territory.

This is particularly evident when survey concerns the study of archaeological ruins. In this case, all analyses made at different scales are particularly important and, therefore, the study must be extended from the single detail to the architectural system to which it belongs and thereby to its location. This will open the way to all interpretations that can be made by reading all the clues found in the area of interest.

The archaeological survey necessarily requires a multiscale approach that can be expressed in the representation by a rich and various body of information and involves a comparative reading of the data. This can be possible today in the new digital documentation systems, particularly referring to interactive maps specially conceived and able to provide information at different levels, paving the way for new readings and interpretations of history and giving rise to a parallel and diversified knowledge of cultural heritage.

In particular, the area of Phlegraean Fields is the truthful expression of the close relations that the archaeological heritage weaves with the landscape and the surrounding area. Witness is the long tradition of views and representations, made since ancient times, portraying the territory in its complex morphology, continuously variable, according to different points of view and where the traces of the

past contribute to increase the quality of a unique place with extraordinary values environmental and of landscape. In addition to traditional perspective views, there are numerous representations that transcend the picturesque character in wanting to make a contribution to knowledge through the precise indication of the different archeological remains within an overall vision capable of render the historical and cultural value of the site. This is a need always felt to communicate through the representation some aspects of sites that could hardly be made through descriptions very attentive, but also shows the implicit desire to create connections through specific drawings that put together data that could not be perceived in reality but at the same time are useful to reading the whole.

During the centuries many researchers have been interested to the area of Phlegraean Fields, studying different periods of its history, of its architectures and of its artifacts in order to give an information framework. It must be told that all studies could never be definitive, not only because history reveals traces of the past during time, but also because the different techniques of investigation, particularly referring to the survey of cultural heritage, enable investigations increasingly targeted that, by improving the knowledge, implicitly modify the same object of study.

The development of new technologies concerning to survey and the new methodologies to store data involve a high information potential. At the same time the way to communicate foreshadows the possibility of creating archives that can be used at different levels, from technicians responsible for the management of architectural heritage who work in the institutions, to scholars and to all those who for various reasons are interested to the history of the past. Currently the Institutions responsible for the management of cultural heritage have set up a general catalogue, that however remains limited to an institutional use, while instead should be available at different levels, in order to promote a spread knowledge of the site and of its particular values.

In fact, the simple tour to archeological ruins doesn't help to overcome the cultural gap that results from a lack of knowledge of the places, of the history, of the events that led to the transformation and to the decay of the place. Therefore it is necessary to have an overview that shows the consistency of the archaeological heritage and at the same time to have a documentation that can provide specific information on individual artifacts. Sometimes in fact the stones by themselves are unable to that tell us about the past and in order to increase cultural interest, new technologies can help to provide useful information in situ as well as at your desk.

That's why it's necessary to map all the archaeological complex of Phlegraean Fields, providing details of the individual artifacts, setting up an information system that can increase the attractiveness of the area and thus implicitly lead to a promotion of the environment. So, the classification that has been made aims to distinguish the archeological ruins on the base of the specific typology, the state of preservation, its usability and the accessibility in order to create a framework with the localization of all the traces of the past that can be found on the area.

The whole area that extends from Pozzuoli to Monte di Procida is an open-air museum where archaeological intense and old urbanization live side by side to contemporary constructions. The goal is to give rise to an action of cultural promotion for the development of such immense wealth through a preliminary project of knowledge, based on an informative base which prefigure augmented reality systems, in order to establish a communication project, designed from the specifics characters of the territory. The aim is to document the current estate by survey and through the subsequent representation, highlighting the potential and the interconnections between places. In particular, making use of new communication systems, the purpose on which the team of the Department of Architecture on Naples of the University of Naples Federico II, is to set up information and data that can implicitly trigger a development of the overall system of the Phlegraean Fields characterized by extreme density and widespread distribution in the territory of the archaeological remains - small in size, but of great historical and documentary-which now seem destined for a progressive decay and appear overwhelmed by the recent buildings. This may be possible through a comprehensive and detailed knowledge of the project, that at the same time could become explicit in an interactive map that allows to navigate on the territory as in reality, reproducing the history, the happenings and the hypothetical reconstruction. In this way, where the archaeological remains do not result explicitly evocative of their history, the system itself will be mediator and support to the narrative.

Furthermore, the possibility to use media technology in order to enrich the experience through a series of information readily available that can integrate the inspection tout court with other information through the use of data accessible thanks to tablets and smartphone, will help fill that cultural gap that derives from the lack of knowledge of the places and of the history that the artifact in its few remains cannot tell. In this perspective our team is working to configure a project of knowledge that is based on documentary data and reconstructions appreciable through augmented reality that must necessarily rely on the fundamental contribution of other disciplines through as multidisciplinary approach to the knowledge and that see the presence of archaeologists, art historians, geologists and all those figures that can provide an interpretation coherent with the reality of the place. (AdL)

1.2 Methodologies of survey and representation of the multi-stratified urban sites. Rione Terra in Pozzuoli. The Temple-Cathedral area in Rione Terra.

Rione Terra of Pozzuoli is a singular multi-stratified site. It is characterized by a complex urban-architectural structure where diachronic events, shaped by the succession of cultures and interventions, charmingly overlap and intersect themselves in a single space.

It is already confirmed that the Rione Terra's structure which is still readable today dates back to the settlement of the Roman colony of the 194 b.C. [1]; the theories that attributed this regular urban fabric to the Greek period are definitely outdated [2]. Nevertheless, the hypothesis of the presence of the temple, in a preeminent position, the highest and most central position of the hill promontory, in a much more ancient period, is confirmed. According to this hypothesis, the temple dates back to the foundation of Dicaearchia, the city founded around 530 b.C., almost surely in the place of the future Pozzuoli, by some exiles of the isle of Samo; these exiles took refuge in the territory of the ancient Cuma, in order to escape the tyranny of Policrate [3].

Fig. 1: Pietro Sante Bartoli, Il porto di Puteoli da una pittura antica, in G. P. Bellori, *Iconografia veteris Romae*, 1764.

Pozzuoli's Acropolis was subjected to alternate events, which led it to the state of abandon of the last decades, before the beginning of the recovery operations of the whole Rione Terra.

The most salient phases, which we necessarily summarize here, are the phases begun from the prosperity of August period. In this period, the temple risen on the ancient tuff Capitolium of the 194 b.C. was rebuilt, entirely in marble until the roof. Despite the relocation of the ancient dock close to the shore and the transfer of some important functions on the plain underlying the tuff promontory, Rione

Fig. 3: Plano de la ciudad de Puzolo, y castillo de Baya con su Puerto y terreno de sus Cercanias, 1734.

Terra conserved its prerogative as settlement until the 1st century A.D., when the threat of the bradisism caused the abandonment of some urban insulae and the cancellation of some street axes. This impoverishment persisted until the high Middle Ages, when the small town assumed a strategic role in the Neapolitan defensive system insomuch as, in 1296, Carlo II d'Angiò declared it state city, bestowing a series of important privileges on it. There was also a strong stimulus from the architectural point of view, with the proliferation of numerous churches and the confirmation of the urban structure of the castrum until the seismic events of the beginning of the 16th century, which culminated with the Monte Nuovo eruption in 1538. The abandonment of the city by its inhabitants, which took refuge in Naples, led the viceroy don Pedro de Toledo to promote the rebirth of the city, giving a great attention to Rione Terra. So, Rione Terra was subjected to a massive reconstruction which upset the Roman age foundation: it was buried because of the creation of new streets; however, these new streets traced the geometries of the ancient structure.

Lo stesso tempio venne più volte interessato da interventi di rifacimento a partire dal XIII secolo sino all'intervento di barochizzazione compiuto tra il 1632 e il 1636, per volere del vescovo Martino de León y Càrdenas, e affidato agli architetti Bartolomeo Picchiatti e Cosimo Fanzago.

Fig. 4: James Thomson, Pozzuolo, the ancient Puteoli, sec. XIX.

Fig. 5: View from the pier of Rione Terra, 2012.

The same temple was many times subjected to interventions of remaking, starting from the 13th century until the intervention of baroquization made between 1632 and 1636, in obedience to the bishop Martino de Leòn y Càrdena's will, and committed to the architects Bartolomeo Picchiatti and Cosimo Fanzago.

Nevertheless, this phase marked the beginning of a new decline due to the transfer of numerous inhabitants and the arrival of the XIXth century modernization with the explosion of the industrialization. These facts increased its nature of peripheral district which continued until the last century when, first of all the bradyseismic phenomena of the beginning of the 20th century, then the fire of the Cathedral and the last events of the 70's and 80's, which are still connected with the bradyseism, decreed its complete abandonment.

The underway research, recognizing the necessity to create fact-finding structures in order to support a hierarchy of interventions of protection, conservation or transformation in the bodies of the historical cities, focuses on the methodological choices and the definition of the work instruments.

The main objective is developing and experimenting survey methodologies able to effectively interpret and represent the complexity of densely stratified urban areas, which need interventions of integration between memory and contemporaneity.

Fig. 6: Aerial photograph of the old town of Pozzuoli, about 1955.

The critical-cognitive evaluation and the historical and interpretative reading, absorbed in a spatial dimension from which the sense of the architectural and urban becoming emerges, are accurate testimonies of an elaborate space-time complex where contaminations and superimpositions of architectural parts and apparatuses, along with the disastrous effects of external events, have produced the actual configurative arrangement.

The application area located within Rione Terra is the area of the Temple-Cathedral of Pozzuoli. This area is an extraordinarily significant example of a site that expresses an unique compresence of archaeological sedimentations on which the sedimentations of the modern city and the evolving contemporary one insert themselves, both from the point of view of the historical processuality and that of the physical-material superimposition.

The history of the place, considered as an architectural material, embraces the survey experience and qualifies it as an unique possibility of reflection about the constituted reality, examining not only the characteristics of its formal expressions, but also the characteristics of the significances which are not immediately disclosed and reveal the traces of the route of the sedimentations in the textual recomposition.

So, a fertile process activates itself: the process that incorporates and makes indissoluble the connections existing between the results of the explorative and restitutive investigations and the programs of the planning hypotheses. This complementarity within our program of survey, interpretation of the superimpositions and individuation of the transformation strategies, has been assumed as a necessary operation for the definition of any decision of data management and planning projection. "Because there is not a judgement of analysis that does not cause a mental inclination of the architect towards a particular planning hypothesis..." [4]. Therefore, it is evident that the necessity of the survey includes in itself the same necessity of the project. In other words, and in the reference case more than ever, the various phases of the survey operation (survey, measuring, dimensioning, comparison with the documents of archive and the historical sources) identify the need to build up the original architectural and urban conformation, already from the first graphic elaborations, within a vaster reflection which has a regard for the elements that can be considered part of the new and transformed architectural structure, although they are transformed and added.

The adoption of three-dimensional data capture techniques (in particular the laser scanning, which strongly innovates the processes of interpretation and re-elaboration of the external data), together with the use of traditional techniques and the solid modelling ones, which permit the controlled management of the complexity, intend to achieve representation methodologies which are able to communicate the sense of the multiple interrelations and interferences between the sedimented parts. So, it is possible the appropriation of the global meaning of the place.

The research operations were grounded on a preliminary fact-finding investigation, which was both documentary and practical and was conducted in the whole area of Rione Terra, in order to contextualize the area of the Temple-Cathedral in its own complex system of belonging.

For this purpose, in particular, in addition to the study of the available urban and archaeological cartography and an accurate photographic sample taking from the land and the sea, we have used a lot of the same results which were pointed out and elaborated by the long operations of intervention still underway in the site.

These operations were just begun on the structures of the Temple-Cathedral, when in 1964 the tests which ensued from a powerful fire permitted to highlight part of the ancient Temple of August; then, they were extended to the whole Rione Terra. Considering their inseparable complexity of study, investigation, excavating, restoration and recovery, these operations have to be considered a prime example of urban archaeology which have produced outcomes that represent an extraordinary opportunity and foundation for every knowledge. (RF)

1.3 Revealing a Cultural Heritage: a relationship between ancient architecture and the process of knowledge for its transmission to the future.

We all know that the main goal of survey and drawing is to reach for more information we can catch from the analysis on an architectural space. The technology can improve this process and, as researchers, we would make a big mistake not considering it as a way to enlarge our capability to see what it is not visible.

So we well know that tools are just tools and that the main considerations we have to care about is how to preserve the cultural aspects that an architecture can transmit to future generations.

Technological development has changed tools used to measure and represent our reality, but the cultural fundaments have still the aim to simplify complexity of geometric models.

A rapid technological development is going on. This change determines the digitization of information across platforms that allow to dematerialize some use of physical space.

We must analyse this period of profound transformation of relational habits also suggesting new tools to interventions for the rehabilitation of the places where we live.

These issues and how they can be resolved at best, deal with the current debate focused around the new concept of living our cities as if they were “smart city”.

One choice could be the change of paradigms of the study of architecture, considering the multiplicity of source of knowledge that are in the new media, changing point of view about what is considerable for generating good spaces and what is not.

This is an horizon of sustainability that doesn't mean less development or cultural downgrade, but it means more interest for what it is really important to re-discover the fundamentals of practicing architecture: a smart balance of technique and cultural aspects.

We are going to have a smart progress when we will understand that what it was considered as reduction of a high-profile culture means simplicity and what we believed to be slow growth, instead means more coherence in the path of evolution.

This aspect of a worldwide consciousness that creates a new vision about architecture is growing higher and wider by a knowledge networking.

Survey has, therefore, the task of analyzing and documenting the relationships that are set up between the different parameters that define the environment where we live in.

Let's see how this theory can be realized by a documentation made with all the information that we can take from operations of survey.

Fig. 7, 8: The area emerged of the ancient roman port in Punta Pennata, Baia, and some of the operations for the survey from the boat.

For over two decades it was developed experimental systems to introduce new ways of enjoying cultural heritage. In this testing ground, technology had a lead role, often to the detriment of contents, increasing the need of defining new way of communication in sync with contemporary iconography culture.

This topic has been felt as a contribution to a new possibility to renew the attention that the archaeological sites around Naples deserve.

The theme proposed has as its object the study of submerged archaeological heritage of Campi Flegrei and of its connections with archaeological areas. In this context the phenomenon of negative or positive territorial bradyseism set rapid changes over the centuries with the collapse of ancient coastline and submersion of all buildings built on this area.

The result is that sites of great value, such as Miseno's seaport, with the Roman navy, and old town of Baia are now largely submerged. So, it is necessary to build a knowledge and communication project that is able to recognize its authentic context.

Considering the conditions just described, the principal aim of the research is to build an interactive map of the archaeological area of Campi Flegrei, able to obtain a territorial improvement and to explore new methods for the survey, analysis and representation of underwater archaeological heritage.

So, it seemed to be very important to use the recent tools of investigation, as the laser static, dynamic scanners, and the techniques of monitoring and control in condition of remote survey.

Survey's technology based on various technics of scanning achieved full maturation. Today it is possible to scan heterogeneous objects supporting to different and appropriate techniques of scanning.

Side-scan sonar can be considered besides others survey instruments, being a category of sonar system that is used to efficiently create an image of large areas of the sea floor. This tool is normally used for mapping the seabed for different purposes, including detection and identification of underwater objects and bathymetric features. It may be used to conduct surveys for maritime archaeology.

Definitely, laser scanners and underwater Interferometry, besides the applications of digital photogrammetry in submarine environment, represent the state of the art of the technology applied to the environmental survey.

The models deriving from these kind of surveys are often supported by philological reconstructions to enhance understanding of ruins.

The project we developed wants to explore diversified systems of investigation and communication of the preserved artistic and architectural patrimony.

The investigation – that is in a *working in progress* mode - proposes the development of the methods to be effected for the knowledge of the submerged archaeological places, through surveys of the

Fig. 9: Image of the 3D model generated by the points cloud obtained by the integration of different tools.

backdrop with the interferometric system, producing the cloud of points with intensity of signal, the DTM of the bathymetry and the images side scan, while for the scannings of the emerged areas it can be realized with the use of terrestrial laser scanner. The surveys took place from preceded boats, must also introduced the use of multifrequencial GPS and of inertial bases, necessary for the instant georeferenciation of the clouds of points acquired by that two different instrumentations. The data gave object of post processing finalized to the realization of a cognitive model, useful to the hypotheses of exploitation and retraining of the studied areas¹.

Depending on the condition to be submerged, the archaeological site of Miseno harbour can not be studied in any other way that is not using advanced technological equipment. Only in this way it is possible to interpret the surveyed data according to the demands of the specific case.

The potential final product is a three-dimensional model derived by the conjunction of bathymetry and topographical analysis of the surface. To such model complex can be assistant the mapping of images realized with digital cameras, to implement the realistic perception of the data related to the investigated area.

To obtain comparable results at international level we tend to find rules and criteria to attempt to construct and display 3D models, as in the case of the criteria established by ICOMOS, in *Charter for the Interpretation and Presentation of Cultural Heritage Sites*.

This procedural method for architectural modelling allows the creation of a measurable and navigable model that is undoubtedly a huge advantage, not only to document and to monitor an architectural work of great value, but also to preserve its status.

In conclusion, we can say that during the last few years we assisted to a real change in procedures for surveying architecture and townscape. A digital revolution has over crossed the entire discipline,

¹ The survey has been possible thanks to the technological contribution of the team from CODEVINTEC, which collaborated with the research team to all the operations useful to catch the data base, supporting us with their knowledge and experience.

bringing new unexpected horizon and creating great opportunities for knowing the deeply aspects of architecture.

These considerations make clear how much necessary is an investigation phase to pick up, to systematize and to experiment the new formalities of scientific growth to realize a whole intellectual products, to be able to be used in the exploitation of important architectural and monumental compartments.

Considering this way of thinking, survey gives us the possibility to preserve cultural heritage by a great capacity in documenting them, to recognize all their value and to create a database, useful for those processes which have the task to find the right project, to make their value even bigger. *(MC)*

Abstract

Since the beginning of XX century the Liberty heritage in Varese and the Ticino area has undergone a slow abandon, due to both the development of new architectural trends and the speculative demolition, and is at great risk of loss. The vital element of the Liberty period is the importance of beauty. Protecting this architecture and landscape system allows to taking care of our identity, finding a thread from the relationship between man and nature, to the most recent findings on sustainability and an "ecological" design.

The paper presents the results of a survey carried out on the Liberty architectures of the Varese and Ticino territory, a limited geographical area where nature and architecture are complementary elements that blend into a whole to be preserved in its unity.

Keywords: Liberty, beauty, Varese, memory, Ticino, identity

1. Beauty, memory, identity

In "The Architecture of Happiness", de Botton investigates the influence and the interactions that the quality of the environment plays on our relationships with each other and on our happiness and misery: observing the multiple aspects of buildings and objects surrounding us is an opportunity for a deeper self-knowledge, which constitutes the real base of happiness [9]. Capturing the secret nature of places, which subsists together with the soul of the world, allows us to rediscover beauty, to awaken from the anesthesia and the failure of sense which is restraining our culture, and to discover the animistic, pagan conception, according to which everything is alive, everything tells stories [21]. It is precisely the trust in beauty which can only give sense to the architecture, the landscape, the city and our own lives.

Resuming a still actual text by Pane [15], it is worth considering the need to bring the aesthetic experience back to the sole condition which makes it actually possible, namely considering it not as an exceptional gratification once the work is done, but as a normal attribute of our daily existence. The aesthetic appreciation of environmental values should be the basis of a rightful citizenship, affirming that both public art and nature heritage aren't a marginal object of contemplation for they involve our inner life and its relations with fantasy, history stratification and memory. Indeed, since the beauty of the urban landscape is linked to the memory of who we are and reminds us of what has taken place, preserving the landscape protects memory, and also defends physical and mental health [19].

The so-called *invisible city* lays *within* and can only be grasped through a profound investigation. If we could use the unconscious, the city would appear different and certainly richer. The unconscious cannot be touched, or shaped into defined forms, yet it upholds every building. It seems reasonable that people be practical and organize the environment effectively, according to their needs. Actually, what we have to ask ourselves is what these needs are and, in the case we also admit psychological needs, how it is possible to activate the psychic reality, and look at both the past and the future.

Walking through the city, we need to meet the past and to recognize ourselves in it. In the city, where the destructive force opposes to the creative one, the continuity of meaning is suggested, the memory is proposed in view of the project, the tradition for the future, utopia for reality. Tradition and progress are opposite and interrelated poles, both essential: they should become enjoyable objects. Therefore, archeology and restoration are only valid if grafted in history, nourishing its continuity, not being isolated in respectful and static veneration of monuments [17].

In broader sense, the city represents identity and safety achieved through the community. It is through the interaction between members of the social community and into the cultural contexts that identity develops and defines itself: whereas this process builds within the individual in isolation, still it has a social nature. Moreover, identity isn't fixed and immutable but constantly evolving, in a process where each individual must choose between infinite variables and connections, adapting to endless change of the living conditions [18]. Recognizing the authentic vocations of a place and protecting its aesthetic values requires therefore a complex design process and is also strictly subjected to environmental ecological conditions, since the preservation of its surroundings is unavoidable, interdisciplinarity turning out to be the key condition of culture [15].

2. A methodology for the enhancement of architectural heritage

In the context of European policy aimed at sustainable and quality cultural and touristic offer, given an interest in Liberty shown beyond the Alps through the international network, a methodology has been

set up aimed at the protection and enjoyment of landscape and architecture, to promote a highly significant regional realities of which Italy and Europe are richly endowed.

A census of the architectural creations is the first step to raising public attention toward the cultural heritage and to protect local identities in front of a European scale through a sustainable, ethical and social model of territory knowledge and fruition.

The research presented here is the result of collaboration between different partners joined by a common desire to safeguard and promote Liberty style as one of the peculiar characteristics of Varese and Ticino area that in the Liberty period found its vocation for tourism. The project, which includes Lombardy Region as leader organization and funding body and the Province of Varese, is divided into different events dedicated to art, architecture, literature and landscape.

The present work is the result of a first research phase aimed at identifying Liberty buildings and architectural artifacts still present on the territory of the Varese Province and of Canton Ticino [10] [20]. In particular, the geographical area assumed for the investigation was that of the municipalities crossed by the route of path 10 of the Regional Natural Park of Campo dei Fiori (Barasso, Bedero Valcuvia, Casciago, Castello Cabiaglio, Cocquio Trevisago, Comerio, Cunardo, Cuvio, Gavirate, Induno Olona, Luvinate, Orino, Valganna, Varese) and the area of lower Ticino.

Fig.2: Historical view of Grand Hotel at Campo dei Fiori by Giuseppe Sommaruga (Restaurant and Funicular Station)

Fig.3: Brickwork vault of the Restaurant at Campo dei Fiori by Giuseppe Sommaruga

The project, aimed at safeguarding an extremely vulnerable heritage and to promote its knowledge, has started by surveying and cataloguing all the buildings and architectural structures which are included within this period, recognizing the typical expressions of the studied style, with a special emphasis on those buildings that can be considered minor examples, often omitted from the numerous studies already performed on the subject. The initial survey was aimed at identifying and taking a census of buildings located on a limited territory, in order to experiment a working method with the possibility to both evaluate its effectiveness and introduce necessary refinements in progress, so that it could then be spread to the whole territory of the province and of the cross-border area.

The direct observation of the building was the most important step of the investigation. The first phase of data recording about the geographical location of the building and its visual observation to identify the overall articulation and the most interesting details was followed by a further reading of the morphological and compositional architecture. Especially valuable in this regard turned out to be, when available, drawings and papers found through historical and archival research, in addition to a targeted photographic survey[2] [5] [6].

A photographic campaign was then carried out with the purpose to obtain pictures as complete as possible to describe the characteristic architectural elements. A general shooting was taken, followed by monographs dedicated to the most significant details. The real possibility to access the buildings and the shooting conditions dictated by the context were in fact critical for the desired result.

The photographs were carried out trying to keep the optical axis perpendicular to the facade and to eliminate the parallax error. According to the articulation of the complex and to the accessibility of the building, all the house fronts were photographed trying to eliminate the surrounding environment, even if natural, then considered apart. Any individual facade was subsequently divided into orders (plinth, second order, third order, gable or pediment), each of which was then subjected to a series of shots

aimed at highlighting its architectural elements, construction materials and finishes. This information was then recorded to complete the evaluation based on morphology and layout.

With the same approach adopted for the general views, photographs of the details were taken in order to describe the characteristic features of each order, starting from the plinth, paying a particular attention to the entrances and their structural, material and decorative elements such as pillars, wrought iron, and other relevant details.

Details shots have been indispensable for the cataloging and description of the decorative details, like for example cornices, string courses, emblems, symbols, racemes, wrought iron and stained glass, together with the openings corresponding to doors and windows, often very complex and articulated elements in Liberty architecture. For each of the different type of openings recognized on the fronts of the studied buildings a monograph was therefore carried out, so as for accessory elements like turrets and porches, where present.

3. Survey on Liberty in Varese and Ticino area

Between the end of 19th and the beginning of 20th century, Liberty has developed in Europe in a phase that is placed in between the use of traditional and innovative constructive techniques, adopting heterogeneous design solutions having different local connotations, also favored by the great universal exhibitions (Paris 1889/1900, Barcelona 1888).

The research of a national style produced various architectural experiments contemporary to Liberty, such as the eclectic, Neo-Gothic and neo-Romanesque style, which in many cases were intertwined to form "hybrid" solutions [3] [4] [13]. As for the two areas considered here, the main causes of Liberty spread are similar for both the Province of Varese and the Canton Ticino. The new rail links joined local areas, while also providing the circulation of new building materials, and created new lines of communication with Europe. These new tourist routes became not only a source of development related to tourism but also to private construction [7]. The Varese and Ticino region began to offer important places for daily and seasonal resort. The landscape was transformed by the presence of large leisure and sporting facilities but in this area also houses for the residence of the local entrepreneurs and large factories were flourishing.

Fig.4: Cover of "Cronaca Fotografica" with architectures by Giuseppe Sommaruga at Campo dei Fiori (Restaurant and Funicular Station).

Fig.5: Project presented by Enrico Besomi at 2nd competition for the Typical Ticino House, 1917. From Fondo Vecchio, SUPSI Library, Lugano.

Both for their homes and for their industries many entrepreneurs chose the emerging Liberty as a representative example of their new easy circumstances. The Liberty territory is seen as the product of the stratification of both human and natural intervention, coordinated in a pattern where the curved line is the ordering element of an apparent disorder. In Liberty, especially in large villas, nature and architecture are complementary elements that blend into a whole to be preserved in its unity.

3.1. Studying the case of Varese Liberty

In the province of Varese, Liberty spread with a few years of delay compared to Milano, more open to the new avant-garde style. Some events are associated with this change and development: the birth of the Poretti brewery (1901-1908), the creation of an electric railway between Varese and Luino (1894-1895, 1904-1905), the foundation of the company Grandi Alberghi Varesini (1907 - 1913), the continuation of the electric railway from Porto Ceresio through Ponte Tresa to Lugano which connected Italy with Switzerland [7]. Varese finds itself to be well connected both to nearby cities like Milano and Como and to the central states of Europe, and these new tourist routes become a source of development also because of private construction.

Fig.6: Photographical survey of the architectural orders, example of application on the facade of Palazzo Castiglioni, arch. G. Sommaruga. Milano, 1904. Photograph by G. Dall'Orto.

The architectures attributable to Liberty, which have connoted the surrounding of Varese since the beginning of the twentieth century until the First World War, are now an essential part of the landscape in which they blend in perfect harmony. The "house", usually on two floors with tower and adorned with innovative floral or geometric patterns, as well as the hotels themselves, are the types of buildings that better expressed the local manifestation of Liberty, which featured the design sometimes of the whole building, sometimes of merely decorative facades more or less valuable.

There are many protagonists bound to Varese Liberty, belonging to different disciplines: architecture, sculpture, painting, iron forging, only to name a few.

Giuseppe Sommaruga (1867 -1917) is the most representative architect for originality and importance of works in this area. In Varese, his name is linked to the Company Grandi Alberghi Varesini, for which he designed and manufactured the Grand Hotel Tre Croci (1908-1912) in Campo dei Fiori, the arrival station of the funicular (1909-1911), the restaurant (1910 -1911), the theater of Kursaal (1910-1911), Grand Hotel Palace and some houses on the mountain slopes [1]. Many other holiday homes were built in the same years along the slopes of the Campo dei Fiori, like Villa De Grandi, besides the Station of the electric tramway at Ghirla, in the municipality of Valganna [23]. Here, another construction is particularly significant, Villa Chini built in 1904 at Boarezzo by Giovanni Chini, sculptor and master in the use of decorative concrete, artificial stone widely used to create the ornamental elements of the Floral style. Moreover, protagonists like Boito and the students of his school have contributed in those years to the architectural debate about the need of a national style, and to the spread of Art Nouveau architecture in these areas.

Fig.7: Gargoyle. Palace Grand Hotel, Varese.

Fig.8: Fountain. Private Villa. Induno Olona.

Fig.9: Railing with floral motifs. Cunardo.

Fig.10: Brickwork bracket. Restaurant, Campo dei Fiori

Emblem of Liberty Varese season is also the Poretti Brewery complex, extraordinary outcome of the collaboration between the illuminated patronage of the family Poretti and the experience of Studio Bihl & Woltz Stuttgart, called in the early years of the twentieth century to renew the original production plant at Induno Olona.

Part of the complex is also the main villa designed by Ulisse Stacchini for the Magnani family between 1903 and 1905. Several other houses and smaller buildings, where elements proper to the New Style can still be recognized, dot the area of Induno Olona and of other municipalities included, albeit only partially, within the Park and showing the uniqueness character that the Liberty assumed in the area next to Varese.

The numerous specific studies already carried out on the subject and the more general ones dealing with the local history of the area, had offered a basic knowledge on which further reflections could be developed. In addition to the work conducted by other researchers, the study has found a fundamental support in all forms of documents preserved in libraries and archives. Writings, photographs, notarial documents, communal practices, cadastral maps, but also oral information, have given for many buildings a complete picture allowing in some cases to discover the name of the manufacturer and the

year of construction. Thanks to the documentation, the main architectural work in the area could be identified. However, it was then the direct contact with the territory, achieved through several surveys, through both the observation of individual cases and the meeting with the people, that allowed to detect the existence of numerous minor examples, often unknown or underestimated.

The recognition of such presences was primarily based on the affinity of the observed stylistic characteristics, often present only in the details, then on the certain attribution of buildings to the investigated stylistic period, supporting the knowledge with other sources of information and finally through the local historical memory on the material identity, the manufacturing techniques and the typical cultural signs.

The complexity of the documentation doesn't allow the research to be considered completed. The final result depends on the cooperation of all those who, for various reasons, retain useful material, and needs a collaboration process be started between the public and the private sectors.

Fig.11: Detail of decorative concrete. Restaurant at Campo dei Fiori, arch. Giuseppe Sommaruga. Varese.

Fig.12: Villa Chini. Giovanni Chini, 1904. Boarezzo, Valganna.

3.2. Studying the case of Ticino Liberty

At the beginning of the last century, Canton Ticino has seen the emergence and spread of a proper Liberty style enriched with trends from neighboring European countries. However, the institutions of the cantons, especially those made to protect the environment and landscape, opposed to the new style, because it was seen as a cosmopolitan fashion going against the search of a style that could be representative of national identity [13]. Despite this defense of tradition, cantonal schools of drawing taught their students to put patterns inspired from nature close to forms inherited from the past. In

addition, as it was happening in the rest of Europe, rather than the institutions it was particularly the middle class who invested in new buildings, entrusting the floral style of the renewal of its image. Promoted by the tourist attraction exerted by cities like Lugano and Locarno, hotels, villas and leisure facilities become elements characterizing the hills and mountains of the Italian canton of Switzerland. Due to the major renovation carried out by the construction industry over the last thirty years, examples of this type of architecture related to holidays in Ticino are less and less numerous. Still, significant examples survive like the former Hotel Felix in Chiasso, designed by Carlo Brambilla in 1907, much criticized by the institutions at the time of its construction due to the opulent Art Nouveau decorations [5].

But, in addition to buildings related to tourism, the choice of Art Nouveau style made by the clients is still evident in many other building types. In Lugano, whole streets are characterized by both this style and the experimentations made by various architects using streams contemporary to Liberty, as an example Via Nassa with the Eclectic palaces of Augusto Guidini and Paolito Somazzi, or Via Canonica with the double apartment building by Giuseppe Bordonzotti, characterized by rich adornments in decorative concrete celebrating a lush and luxuriant nature. Related to Bordonzotti, surely one of the greatest exponents of Ticino Liberty, is the jewel ex Cinema - Theatre - Variety of Mendrisio, intact today only in its main front. The compositional tension of the facade is concentrated in the large trefoil arch opening and in the decorative concrete, which emphasize the layout of a modest size building. Clearly inspired by the Belgian French Art Nouveau, Ticino Liberty has a sole example due to the Viennese school, the powerhouse of Biaschina in Bodio, designed by Milanese engineer Ugo Monneret de Villard and by engineer Agostino Nizzola between 1906 and 1911 [13].

Fig.13: Ex Cinema, Theatre, Variety. G. Bordonzotti, Mendrisio.

4. Further development of the research

The aim of safeguard pursued by the present research, inevitably involves the dissemination of knowledge. In this sense, a project of sharing the collected information should be carried out through easily accessible communication tools, available to as many users as possible in the belief that the derived knowledge can be the most effective way to protect the existing heritage.

Further steps of the project will include the preparation of a catalogue of the surveyed architectures that would offer a view of Liberty heritage in the Province of Varese and in Ticino as most comprehensive as possible, the organization of the collected material on a data-base accessible both through links activated from the websites of the involved municipalities, and through mobile applications which will offer the users the chance to easily locate the worth noting objects and identify

new knowledge paths of the area. Sharing the data-base with the local population will also provide an additional tool for testing and integrating the documentation and will help to improve the results of the project.

The research will include a wider "cross-border" program aimed at the implementation of measures of protection, promotion and development of the landscape and the historical and cultural heritage. The strategic objective is to strengthen the common identity of the studied territories historically detectable in the network of pedestrian crossing and connections of the studied regions. The paths among Liberty architectures lead the visitors in the vicinity of the towns and in the most beautiful residential areas of the municipalities where the territory stretches. An interesting way to find these places is to get there through the network of walks, some of the trails allowing walking or cycling seamlessly to discover gems of Liberty architecture of which the buildings reported here are only the most prominent examples. Aim of the project, through the synergy between experts in cultural itineraries, governments, landscape architects, designers and the local population, is to strengthen the common identity through the preservation and the promotion of a greater understanding and enjoyment.

5. Conclusions

The need to promote effective sustainable practices at the European level requires extending the concept of sustainability, adopting a systemic approach that includes both the renovation of the built heritage and the improvement of the quality of life, through the integration between economic, environmental and social issues with the complexity of the territory. Assuming a holistic view can enable to integrate as much as possible appropriate technologies and policy measures to obtain advantages in terms of quality of life, environmental protection and local businesses. In this context historic centers, landscapes and existing architectures form an essential resource as well as culture and events. According to an "extended" and complex concept of "cultural heritage", traditional monumental and artistic objects, territorial and municipal systems, environmental landscapes contribute to form local identities. In the paper, a methodology for the enhancement of cultural heritage has been proposed and its application to Varese and Ticino Liberty has been presented. The collected census data are going to be networked through online tools such as the Information System of Cultural Heritage of the Lombardy Region (SIRBeC) and the Réseau Art Nouveau Network [22]. Public attention toward the Varese and Ticino Liberty heritage is going to be raised through a sustainable, ethical and social model of knowledge and fruition of the territory, based on the use of easily accessible communication tools, applicable to other significant regional contexts and to other historical periods.

Acknowledgments

E. Guglielmi is gratefully acknowledged for his guidance on the method of photographic survey, G. Jean for her useful indication on the Ticino Liberty, L. Gregori for the fruitful suggestions on the concept of identity, the Municipality of Comerio for supporting the research.

Heritage and sustainable development: the Middle East and Doha

Francesca Romana MORETTI

Dipartimento di Cultura del Progetto, SUN – Seconda Università di Napoli, Aversa, Napoli.

frmoretti@hotmail.com

Heritage and sustainable development: the Middle East and Doha

Heritage and tourism have become, in the last two decades, dynamic areas of development especially for the Middle East Area. The idea of heritage is crucial to the critical decision-making process as to how irreplaceable resources are to be utilized by people of the present or conserved for future generations in a fast changing world. The importance of heritage to the development of a tourist destination, the emphasis on developing appropriate adaptive reuse strategies has certainly been overemphasized. Already the general assembly of ICOMOS (Mexico, 1999) stated, that in the context of sustainable development, two interrelated issues need attention, cultural tourism and historic towns. Without adequate adaptive reuse actions to ensure a sustainable future for these resources, may lead to their complete vanishing. The growth of cultural tourism and its role in dispersing heritage to everyone is developing rapidly. According to the World Tourism Organization, cultural heritage resources are and will remain motivating factors for travel in the foreseeable future; according to the experts, people choose destinations where they can learn about traditional and distinct cultures in their historic context. The Qatar rich urban heritage is now being recognized as a valuable resource for future development. The role of heritage and its implications for urban conservation in the context of the historic Doha is central for understanding the new phenomenon of the heritage tourism in Qatar.

Keywords: Heritage Tourism, Urban Conservation, Development, Identity, Sustainability

1. Urban heritage, tourism and sustainability: the Arab World

“Arab heritage, one of the main strands of world heritage, is rich and diverse. It represents, with all its myriad manifestations, a cultural capital that can be mobilized, a time of radical political and economic changes in the region and the world as a whole, as a means of enhancing prosper and as a foundation for effective and productive dialogue among nations.”

The central urban districts are, following the mediterranean tradition, the centers of the historic cities in the Arab World; they are the locus of economic, cultural, and residential activities, and are often overpopulated and densely built-up. Moreover, they are the containers of major souks, monuments and districts of architectural and historic significance. Therefore, they need a particular attention to survive under the waves of the current globalization era. In the face of rapid economic development, population growth, people increasing needs and changing lifestyles, most centers in the Gulf have experienced problems in making the necessary adaptation to the present waves of change.

The marked deterioration of the physical fabric in these centers greatly mitigated the identity of the Arab city. In the last decades many of these areas have been marginalized and left to face their fate alone, of neglect and dilapidation. The growth of cultural tourism and its role in dispersing heritage to everyone is developing rapidly; the balance that must be maintained is between visitor access and conservation needs. The regional and global transformations underway require a serious examination of the mind-sets that have influenced humanity over the last centuries leading to the current situation in order to assess the potential for accommodating change and participating in the ongoing global developments. Mind-sets influence the way people see themselves and others, and how they make decisions in a changing world. At times of dramatic change and uncertainty people are likely to cling to traditional beliefs and practices, often without re-examining their suitability for coping with new situations. The tendency to cling to the past and sometimes to adhere to its formulae represents a

flight mechanism and an escapism to the comfort of what has been tried in the past, following the Arab saying: *Elli ti'rafu ahsan min elli ma t'rafoush* (what or whom you know is better than he/what you do not know). As such, tradition provides patterns of knowing and acting under uncertainty.

This may often be a good thing, but at times this conservative policy may lead to a denial of the present and blindness to novel opportunities and solutions.

Sustainable development can be seen today as a powerful motivation for urban conservation planning. Basically, it would consist of a process of urban development based on the constant reuse of existing built resources, associated with a low input of energy for adaptation to new requirements conceived in society. It is also viewed as a process founded in the local culture, in an equitable distribution of urban services, the use of democratic principles of management, the maintenance and regeneration of traditional social values and practices. From the perspective of sustainability, cultural heritage is understood as a non-renewable resource. It encompasses some of the most important cultural values of society (identity, memory, self-consciousness and artistry), and is an asset capable of attributing value to new things through the creation of new processes based on established values.

In old cities and centers, history and heritage have become the dynamic assets that combine the local and the global. They establish the local distinctiveness so attractive to a globalized tourist market. From the sustainable approach, the city is understood to be a unique ensemble that needs to be conserved in its historical integrity. This means understanding the city as a dynamic process, a structure in permanent and continuous change. There is yet another argument for conserving old buildings and areas: the uses to which they are put and the people who occupy them.

At one time, conservation of urban heritage related only to fabric, then its scope widened to character. There is now a growing realization that the activities and communities accommodated in old buildings and souks are themselves worthy of conservation. Therefore, keeping the fabric and areas of character may go a long way to retaining the life within them. Adaptive reuse is a phenomenon which has great significance, not only because a symbiotic functional usage in historic buildings steps up the maintenance of the structure and thus delays its decay, but also because the resultant monitoring prevents cases of vandalism and scavenging of material heritage as is seen in buildings that are abandoned.

The importance of integrating economic and cultural activities cannot be overemphasized, for it is highly impossible to conceive of an economic activity that does not have a cultural impact, and vice-versa. Buildings represent such a great economic, social and cultural investment that it would be unwise for the community to waste. However, the conservation and re-use of buildings does not mean that towns and villages should remain unchanged. For a town to be sustainable it must be viable; to remain viable it must change as circumstances change. Architecturally, a historic souk or area may appear delightful but economic activity is essential for its survival. It is not only the preservation of the physical fabric that helps conserve its meaning, but its usage and function that helps it to withstand the rapidly changing urban dynamics. It is the activity and usage of these souks and areas that continues to make them meaningful artifacts in the present city and a strong vehicle to sustain their life and cultural identity. After discussing the main issues related to heritage tourism it is necessary to analyze down to earth experiences where heritage tourism was a catalyst of regenerating rundown and derelict historic areas. For instance, the case of Souk Waqif in Doha might provide potential lessons that can be learnt and adopted in other souks in the Gulf and elsewhere.

2. The city of Doha

Doha, the capital of Qatar is the largest city, with over 80% of the nation's population residing in Doha or its surrounding suburbs. It is also the administrative and economic center of the country with a population of 998,651 in 2008. In 1825, the city of Doha was founded under the name of Al-Bida.

The name "Doha" came from the Arabic *ad-dawha*, "which might have been derived from "dohat" — Arabic name for bay or gulf — referring to the Doha bay area surrounding corniche.

In 1820 Major Colebrook described it as following: "Guttur - Or Ul Budee [Al Bidda] once a considerable town, is protected by two square Ghurries near the sea shore; but containing no fresh water they are incapable of defense except against sudden incursions of Bedouins, another Ghurry is situated two miles inland and has fresh water with it. This could contain two hundred men. There are remaining at Uk Budee about 250 men, but the original inhabitants, who may be expected to return from Bahrain, will augment them to 900 or 1,000 men, and if the Doasir tribe, who frequent the place as divers, again settle in it, from 600 to 800 men." (Rahman, 2005).

The city of Doha was bombed about three times which explains the disappearance of a large number of its historic buildings and areas. First it was bombarded by the British vessel *Vestal* in 1821, then it was bombed again in 1841 and the village was completely destroyed in 1847 after a battle against the Al Khalifas of Bahrain near Fuweirat. Al Koot, the Turkish fort established by the Ottomans in 1880 adjacent to Souk Waqif and near the main *maqbara* (cemetery) to control Doha and secure Souk Waqif from stealing, as most of the prominent traders had their houses in the Souk.

A small force was garrisoned in the Koot, but left with the signing of the protection agreement of 1916 between Great Britain and Qatar. Subsequently Al Koot Fort was used as a prison for a time.

Al Koot fort was a home for the guards who patrolled the *suq* at night, a service paid for the traders who refused to pay taxes in the Souk. This confirms that Souk Waqif is well deep in history and was established well before 1880 when the Ottomans built their fort. According to Mr. Mohamed Ali Abdullah a designer from the Private Engineering Bureau, in charge of the rehabilitation of Souk Waqif that the latter goes back as far as 1850s. (Boussaa, 2010).

In 1916, the city was made capital of the British protectorate in Qatar.

During the early 20th century, much of Qatar's economy depended on fishing and pearling, and Doha had about 350 pearling boats. However, after the introduction of the Japanese cultured pearls in the 1930s, the whole region, including the town of Doha, suffered a major depression and Qatar became a poor country, plunged into poverty.

Oil was discovered in 1939, but its exploitation was halted between 1942 and 1947 because of World War II and the Bahrain embargo. Oil exports and payments for offshore rights began in 1949 and marked a turning point in Qatar.

The 1950s saw the cautious development of government structures and public services under British tutelage.

During the 1960s, new administrative centers sprang up to manage the vast revenues. In 1969, the Government House opened and today it is considered to be one of Qatar's most prominent landmarks. Following the withdrawal of the British, the State of Qatar declared its independence on September 3, 1971. Doha as the capital of the new state, attracted thousands of foreign experts and workers, employed in the construction and engineering industries.

Since then, Doha has seen the most extraordinary expansion in international banking, sporting and tourism activities, as evidenced by the many modern towers, malls, hotels and seats of power scattered throughout the city, and through huge developments like the Pearl, a whole commercial, residential, tourist and leisure complex beyond the West Bay area.

The physical development of Doha and the various conurbations of the peninsula have been accompanied by extensive preparatory work, which led in many occasions to the destruction of historic buildings and areas. There is a national pride in the redevelopment with demolition being seen as a necessary process.

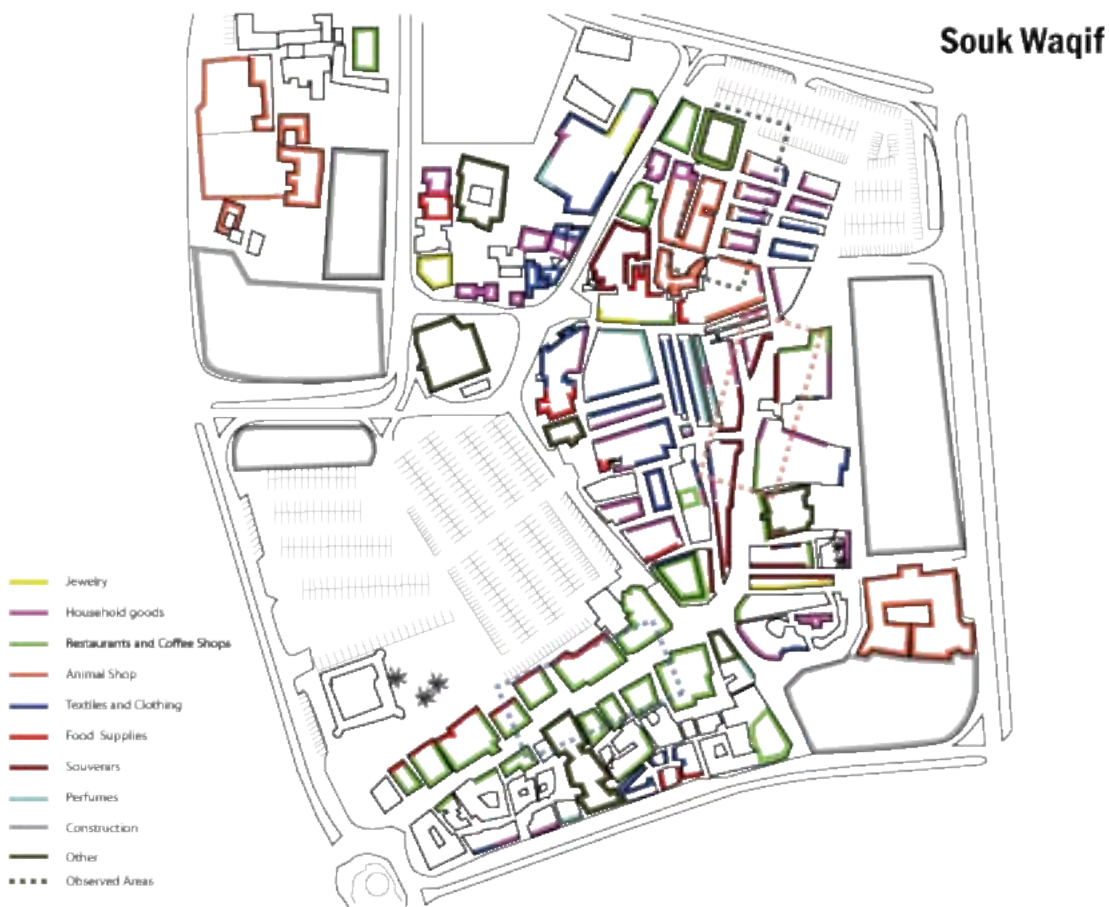

Fig. 1: Souq Waqif Map

2.2 Souk Waqif: From Survival to Revival

Located behind the Corniche, off Grand Hamad Street, Souk Waqif is a showcase of traditional architecture, handicrafts and folk art, and was once a weekend trading area for the Bedouin.

The origins of the Souk date from the time when Doha was a village and its inhabitants gathered on the banks of the Mushaireeb *wadi* (river) to buy and sell goods. Waqif means in Arabic (standing); refers to the merchants and inhabitants who were obliged to do their businesses by standing because of the water flooding on both sides from the Wadi Mushaireeb, and pouring to Al Khrais area in the souk before reaching the Corniche.

Souk Waqif is a maze of alleyways covering a wide area, with separate sections selling perfumes and traditional forms of Qatari national dress, luggage, tools, general hardware and gardening equipment; tents and camping equipment; kitchenware, spices, traditional sweets, rice, nuts, and dried fruits.

This shopping destination is renowned for selling traditional garments, spices, handicrafts, and souvenirs. It is also home to tens of restaurants serving cuisines from all over the world.

Although this market dates back to the 1850s, it has been recently restored back to its original character. It is now considered one of the top tourist destinations within Doha.

The Private Engineering Bureau of the Diwan Amiri launched the rehabilitation project of Souk Waqif in 2003. Since most of the buildings in Souk Waqif were privately owned, the government bought these buildings from their owners in order to start the work. After a detailed survey it has been found that 2/3 of the buildings were authentic, however only one third of the historic buildings were demolished and replaced by modern structures.

Fig. 2: Msheireb Urban Regeneration Master Plan by a consortium of AECOM, Allies and Morrison Architects, and ARUP (Source: T. Makower)

The strategy adopted in conserving Souk Waqif consisted of the following measures and actions: restoration of the old part of the Souk; replace the new structures with new ones reconstructing the old ones; modernize the infrastructure of the Souk; remove all the advertisement signs and all what disturbs the image of the authentic image of the heritage area. In order to achieve an authentic restoration, local buildings were used, such as Danjal, Bamboo in the roofs, the glass doors were replaced by the original wooden doors and windows. After 7 years of work the dream of rehabilitating Souk Waqif has become a reality. It has become a living heritage in the middle of a global environment; it has strengthened its place as a major hub for the Qatari people, and all residents of Doha. People go to Souk Waqif for shopping, entertainment and gazing around. Souk Waqif has become a major attraction for all tourists and official visitors to Qatar.

Recently, Souk Waqif has become a major hub for art galleries and workshops, hosting several art galleries and local concerts during holidays and special celebrations. In addition to shops, cafes, restaurants, hotels the Souk Waqif Art Center is located in the restaurants area. The Center combines a selection of small artistic shops with a number of exhibition rooms laid out around a long narrow courtyard. Beginning in 2004, the Souk started to be rehabilitated according to traditional Qatari architecture techniques, using local building materials. Currently enjoying the last phase of rehabilitation project, Souk Waqif is a major tourist place to explore. There has been a Souk on this site for centuries, as this was the spot where the Bedouin would bring their sheep, goats and wool to trade for essentials. It grew into a scruffy warren of concrete alleyways in recent years but now its tourist potential has been recognized and it's been cleverly redeveloped to look like a 19th-century Souk, with mud-rendered shops and exposed timber beams. Despite the fairly 'Densification' of the area, the chief business of the Souk continues unabated and it remains one of the most bustling and thriving traditional markets in Doha. The revitalization project was based on a thorough study of the history of the market and its buildings, and aimed to stop the dilapidation of the historic structures and remove a number inappropriate alterations and additions that were introduced.

The Private Engineering Office in charge of rehabilitating Souk Waqif attempted to revive the memory of the place. In order to achieve this, modern buildings were demolished, metal sheets on roofs were replaced with traditional roofs of *danjall* and bamboo with a binding layer of clay and straw, and traditional strategies to insulate the buildings against extreme heat were re-introduced.

Some new features were also introduced, such as a sophisticated lighting system that illuminates the market's streets. In complete contrast to the fake heritage theme parks that are mushrooming in the region, Souk Waqif is both a traditional open-air public space that is used by shoppers, tourists, merchants and residents alike, and a keeping as a living market day and night.

Fig. 3: DOHALAND; signature project Heart of Doha 1

Developed on a 35-hectare site at Mohammed bin Jassim District, the project is located in inner Doha, comprising five phases, ending in 2016. Turner has entered into a joint-venture with Dohaland to offer project management and construction services. The other groups that form a part of the project are DTZ (financial feasibility) ARUP/EDAQ/Allies and Morrison (design regulation and site planning approval), Rider Levett Bucknall (Cost consultancy), ARUP (infrastructure) and Urbis (retail).

The Phase 1A, is a cluster of three civic buildings, and has been designed by Allies and Morrison, Burns McDonnell and Gillespies. The first construction contract of the project has been awarded to Bauer International Qatar. While creating the masterplan, the project team drew inspirations from Vision 2030, the basis of the “Twelve Perspectives” for the development of the Heart of Doha.

The 12 perspectives include history, culture, continuity, urban planning, heritage, landscaping, challenging architecture, water, environment and sustainability, citizenship and community, commerce and business, implementation and the future.

The final master plan was ready by summer of 2008. The main focus of Heart of Doha is to construct places that are compatible with the unique environment and culture of Qatar. The CEO of Dohaland, Eng. Issa M Al Mohannadi, said that the sustainable model being developed for the Heart of Doha project, involves working with environment, while living as a part of it.

Dohaland has spent more than three years researching and collaborating with world-class institutions such as MIT and Harvard, to develop the best model, he added.

The mixed-use development will feature 226 buildings in total, ranging from three to 30 storeys, including a national archive, theatre and museum, hotels and heritage quarter. The project has a projected population of 27,637 and the entire scheme is estimated to be complete by 2016.

2.3 Epilogue

Rehabilitation of Souk Waqif is a successful example of sustaining souks and markets in the present global environments in the Gulf. After long years of dilapidation and neglect it has become a sustainable living heritage in the heart of Doha. Despite the threats of the expansion of high rise developments around the souk, it is a strong statement and message that a souk can survive despite the proliferation of laborious shopping malls around. In complete contrast to the heritage theme parks that are becoming common in the region, Souk Waqif is both a traditional open-air public space that is used by shoppers, tourists, merchants and residents alike, and a working market.

Due to the efforts undertaken to rehabilitate this souk during the period 2004-2007, the Aga Khan Award for Islamic Architecture has pre-selected this souk from the 400 entries to compete amongst 19 nominees for the 11th Cycle of Aga Khan Award for Architecture.

Fig. 4,5: Souq Waqif

There are three key lessons learnt from the Heart of Doha project; first, the success of this project can be attributed to a good brief from the client Dohaland, an excellent project team and a gilt-edged peer review panel which includes eminent professors from MIT, Harvard and Princeton Universities. Second, the cost of retro-fitting a city district which has grown up with motorcars cannot be underestimated. In order to create tighter streets and a fine urban grain, the impact of private cars and delivery vehicles has to be mitigated. A substantial basement infrastructure is thus created to cope with these modern demands whilst maintaining a strong public realm network above ground. Lastly, environmental sustainability [LEED] can be achieved much more effectively at a Master plan level than at an individual building level. By positioning buildings closer together, deep shadows are created to shade adjacent buildings and thus reduce the overall cooling load during the shoulder seasons of March to May and Aug to October. This also creates a shaded and comfortable public realm for people to enjoy.

Abstract

This paper is divided into two parts: the first seeks to compare the results of two surveys made with a time of flight scanner, Riegl z420i, and a phase based scanner, the Faro Focus^{3D}. These surveys were conducted inside an industrial heritage building, the Fabra i Coats boiler room (built between 1910 and 1920). The complexity of this construction allowed us to make a comparison between technical characteristics of the instruments, settings, data collection and lighting conditions. The second part develops a classification workflow for this information. Architectural parts and installations were separated in relation to three topics: historical construction, function and architectural program. A high density point cloud model was generated, over 1.300 million points in a building volume of 7.000m³. Finally, advantages of this process in relation to the diffusion of heritage, conservation documentation for the proper understanding of the current state are discussed as well as the representation of its historical evolution in an interactive real-time point viewer.

Keywords: Laser Scanning, Industrial Heritage, Digital Preservation, Classification, Point clouds.

1. Introduction

Although there are several techniques for cultural heritage documentation, terrestrial laser scanner (TLS) technology allows a survey of very complex sites in short periods of time without compromising precision. Standard workflows are required in this type of surveys for a better understanding of the building. It is a complex task to propose a unique methodology, given the technical characteristics of instruments, the complexity of the objects and the piping facility, and the diversity of materials in these scenarios.

An example of this methodology is presented for the classification of a high density point cloud of an industrial heritage interior. A structure for the database is proposed to facilitate the access to existing information and documentation generation by users involved in the process of heritage conservation, in terms of planning, interdisciplinary communication, evaluation of outcomes and as a dissemination tool [4].

The case study is the Fabra i Coats engine room, an industrial heritage icon of Barcelona, where boilers supplied the energy for the textile factory to work, first by coal and later by gas. This room is part of a larger complex consisting of several buildings built in different periods, the oldest dates from 1890. The complex has witnessed the history of Sant Andreu de Palomar (the old town where he was born) before its annexation to Barcelona. The Fabra i Coats, textile factory represents an exceptional moment in the city's development and industrialization process which Catalonia lived in the XIX century.

This study covers different levels and scales of detail, ranging from machinery cables to brick walls that compose the main body of each boiler. A comparison of the technical characteristics between two different laser scanners is made relative to the survey proposed, looking to improve the process in relation to the data needed to identify the classified elements for a proper documentation and the time required for each survey. In this process, a comparison between two technologies is also made; a time of flight, Riegl z420i, and phase scanner, Faro Focus^{3D}, is discussed.

The paper is organized as follows: section 2 describes the case study and section 3 is a comparison of the results of the two surveys in terms of data acquisition, resolution, accuracy and density of points. Section 4 presents the workflow in the segmentation/classification of the point cloud model in relation to the data density and the complexity of the geometry. Finally, section 5 focuses on the structure of the database, designed to communicate the historical evolution of the different engines, data accessibility and its interactive visualization.

2. Case Study: Fabra i Coats engine room, Barcelona

In the nineteenth century, Catalonia was a major player in the Industrial Revolution, leaving its mark in history by changing the traditional craft production structure for the organization linked to the factory. With an urban and productive progress so fast and intense, many industrial buildings ceased to exist, others continued abandoned until further use or where destroyed. Fortunately, others have been rehabilitated. Today, these buildings are part of the identity of Catalonia; they are part of the rich urban and architectonic heritage of Barcelona, as well as a representation of the collective memory [2].

One of the most prominent examples of these processes is the rehabilitation of the industrial complex of Fabra i Coats, cataloged as Architectural Heritage of Barcelona with the "C" level [1]. Being a building that meets historic, artistic and aesthetic values, it has a relevant urban impact in the area where it is located. The Barcelona City Council bought it in 2005, turning its main buildings into a Cultural Center. It is a group of warehouses, currently under construction, with resources for the creation, practice, and dissemination of multi-disciplinary art, and the flagship project for the "Fàbriques de Creació" program.

The survey with the TLS was focused on a central chamber of the industrial complex, built between 1910-1920. It consists of a boiler room, a power plant room and a pump room. These last two rooms are located on the ground floor of a four level building. The construction has a brick structure, with English laminated profiles as columns and beams.

3. Laser Scanning Data Acquisition

As a preliminary step to the classification of the point clouds, technical questions have been raised in relation to the characteristics of a TLS survey to identify small elements in industrial heritage buildings in relation to adjustments, yields and analysis data. This data must take into account the density of points necessary to identify all elements, the optimum distance for capturing data, involvement by angles of incidence and occlusion, considering the different characteristics of both of the equipment used.

The survey of the interior of Fabra i Coats was performed with two high precision scanners:

- The first is based on a flight time principle, Riegl z420i, with a field of view 360° H * 80° V, accuracy 10 mm and a distance range from 2 m up to 250 m, 1.5 million points per 5-10min scan at 0.1° resolution.
- The second scanner is based on Phase-Shift, the Faro Focus^{3D}, this scanner system allows for a larger field of view 360° H * 305° V, with a range accuracy 0.6 mm @ 10 m, 0.95 mm @ 25 m (wavelength in nm 905), $\leq \pm 2$ mm systematical distance error at 25 m, beside intensity of reflected beam the Faro is able to acquire RGB, with an integrated camera 70 megapixels [5], 38 million points per 5-10min scan at 1/8 resolution.

At the end the resolution of the survey depends largely in the number of positions and the resolution established per scan. The importance of the registration process is key to the final point cloud resolution as every single element in the room, including the cables or lamps, is pretended to be registered and classified. An ICP method was adopted (figure 1) instead of the traditional target registration technique as it performs a validation error in the binding of each position. This process allows a great level of accuracy as all the information of the acquired data is considered, rather than only a limited number of points. The principal advantage of the ICP registration is independent to the nature of the geometric data (points, curves of different degrees of the surfaces). It is based on minimizing the distance between

two point clouds, point by point, by successive iterations. The main disadvantages of this process in its original form, is the convergence to a minimum which may be false, especially when data contains a lot of noise, and it takes a large number of iterations for the convergence of the model. A final 1.300 million point cloud model was obtained from 82 registered scan positions for the Faro, and a 45 million point cloud model was obtained from 16 scan positions for the Riegl.

Figure 1: Scan positions ICP registration

The first comparison between the two surveys is clearly the final number of points per square centimetre. The Riegl data was acquired with a 0.1° angle (1.5 million points per scan), and the survey with the Faro was acquired with a 1/8 resolution and a 4x quality (38 million points per scan). Figure 2 shows a direct comparison between instruments, scanned at the same distance, about 2,5 m from the center of the boiler to each scanner with a 0.5-2mm resolution with the Faro Focus^{3D}, and a 5-10mm with the Riegl z420i.

Figure 2: Comparison of resolution between Riegl z420i (left) and Faro Focus3D (right).

One of the reasons between the differences in the point cloud models are not only the number of points acquired but also occlusions. The accessibility between the boilers, the different heights, the complexity of the piping distribution allowed a limited number of scan positions, which had a direct relation with the

occluded areas (figure 3). The final point cloud model had a resolution of 0.2 mm with the Faro Focus^{3D}, and of 1cm with the Riegl z420i.

The density of points change between the interior and exterior in both surveys:

- In relation to the distance of the scanner and the complexity of the space-object, the scan distance in the exterior with the Faro and Riegl varied between 3 to 5 meters. A homogenous point cloud was generated.
- In the inside of the building, distances varied significantly between objects. Figure 4 shows some of the typical problems that we face in this survey. This image represents an architectural plan-section from the Riegl point cloud with a high percentage of occluded areas. As the data collection instrument is limited to an 80° angle in the vertical axis, it fails to document every part of the building. On the other hand, the Faro scanner has a 305° vertical angle in data acquisition, covering all the elements of the building, minimizing occluded areas and overlapping positions, decreasing the time in surveying and making easier the work plan. Number of positions were minimized, reducing overlapping, solves problems caused by the scanning angle, like problems with the normal of points (point direction in relation to the geometry), allowing a better illumination using the normal information.

In the data collection process the ambient lighting conditions were different between both scanners, for example inside the basement there was no direct lighting, only indirect lighting (specular), this affected the intensity information in the phase-shifting scanner (Faro), changing the range of intensity between levels, this problem was corrected using an equal falloff compensation for each position, modifying the current range at a distance of 20 meters for each scan and applying an auto-scale level for the intensity values, this also meant that the information out of this range will not have a correct intensity value, and each scan needed to be distance-filtered within this distance. This range depends on the quality of the data and the distances in the space. The Riegl did not showed any significant change in the value for the intensity.

Figure 3: Architectural ortho image. Riegl z420i, and Faro

4. Classification / segmentation workflow

The high density of points in the final Faro model (1.300 million points in a 7.000 m³ volume) made a direct segmentation a difficult task. Segmentation by architectural levels was first proposed, starting with the organization of the TLS position by levels; each level was divided in three files using a predefined height, via Pointools¹ clip box tool.

The next process was the extraction of the architectural elements of the building. In this process the floor was recognized as the principal element, as without it, walls and engines were easier to identify. The area containing the floor was first extracted using a clip box tool, and then a RANSAC process in Matlab was applied for a finer selection. RANSAC considers this information a plane for the extraction, taking in to count that the data contained handrail bars on the ground.

¹ Point cloud visualization software. pointools.com

After the floor was extracted, we proceeded to divide the walls from the pipes along the walls (figure 4). For this process a combination of RANSAC extraction and a manual edition in Pointools Edit software was used. The same process was repeated from the information containing the wall and the boilers, the pipes and the machinery. The segmentation between the roof, the wall and the structure needed manual interpretation, because of the complexity of these elements as they blend together, for example a structural beam can be considered either supporting element or a part of the cover.

Figure 4: Complexity of classified surfaces

4.1 Classification in relation to the historical development, function and architectural program

In order to simplify user's access to the different parts of the heritage building, a classification based in architectural characteristics was required, although it can also be divided further taking into account three different variables:

- The historic development: integration of different boilers, changes in the building, evolution or modifications of the machines
- The function: coal boilers, gas boilers, electric system, hydraulic system
- Architectural program: areas were divided by different activities

The structure of the segmented point cloud to a classified one was mainly a manual process as it required a specialist interpretation to assume these differences, is not only based on geometry characteristics but rather on the knowledge of the buildings characteristics. Pointools Edit software was used for this division (figure 4). Classification order started from the first two coal boilers (N2 and N3), coal was served by hand, and supported by a system based on hoppers, supported by the bearing wall and a complementary metal structure. These boilers were modified to gas as energy source, with the addition of a burner and a steam accumulator on top.

The introduction of two new boilers (N4 and N1), forced an architectural expansion, the height of the roof and walls were raised 3 meters, reaching a final distance of 10 m height at the lowest point. The new gas boilers were elevated with respect to the previous ones from the floor by 3 meters in order to facilitate the cleaning of the used coal. The last boiler was introduced in the building by making an opening in a peripheral wall, as the tank was smaller and did not require the disassembly of the roof for installation. This last boiler only worked with gas and gave the same energy power of the four old ones (N5).

The ventilation systems associated with the boilers were modified over time, leaving at the outside of the complex a brick chimney and others metal made. Complementary to this system, two parallel systems worked together, one electric and one hydraulic. They were used to distribute energy to the other buildings through steam from hot water boilers, and to act as a fire prevention system. These combined with the boilers, generate a complex network of pipes and auxiliary machines, distributed onto walls and connected at the top with the boilers.

The architectural part is in close relationship with these machines, on the lower level with warehouses, on the upper floors with a metal frame for circulation (Figure 6), that reaches the highest point of the machines, the roof with its modifications with a metal structure trusses and a metal structure that is still being modified, as a reinforcement to the complex.

Figure 5: Database structure for the final point cloud model (31 parts).

In general the data structure is represented above (figure 5), the tree principal spaces; the boiler room, the high voltage room and the fire system room, this last one is considered as an important innovation in the industrial revolution of Catalonia.

Figure 6: a) circulation left in red, trusses in orange, coal storage hoppers in yellow, and ground in gray. b) N3 and N2 isolated boilers

4.2 Fine selection and extraction with RANSAC

The process Random Sample Consensus (RANSAC) is proposed by Fischer and Bolles (1981) is an iterative method for estimating parameters of a mathematical model from a set of observed data. This method comes from the field of computer vision. Used as geometrical segmentation algorithm due to its ability to automatically recognize the forms through the data (planes, cylinders, spheres and bulls), despite the noise.

Figure 7: RANSAC detection to extract the ground and facades in complex models. A) Classified ground points. B) Example of a segmentation of the major plane in a façade.

The method RANSAC used is RANSAC.m from the RANSAC Toolbox for Matlab™ [6]. The principal options assumed are: for the scalar value of the noise variable sigma a value of 0.01m, the probability of error P_{inlier} 99%, percentage points to be considered as a plane 25%, we use the equation 1 for the selection of the minimal base points (m) to establish the relationship between the points and the plane. This calculation requires the P_{inter} (P), the minimum number of points required for the calculation (p), the fraction of abnormal values observed (outliers, ϵ).

$$m = \frac{\log(1 - P)}{\log(1 - (1 - \epsilon)^p)} \quad 8.4 = \frac{\log(1 - 0.99)}{\log(1 - (1 - 0.25)^3)}$$

Equation 1: minimal base points for the detection of a plane

The resulting shapes are tested against the original data points to determine how many of the points come close to the shapes (Figure 7). From the extraction of these data the surface can be calculated, striving to outline the geometry.

5. Diffusion of Heritage: the virtual model

The final part of the process is the appropriate diffusion of the information. We divided the final classified model into three categories: a model for specialized users, a model for general users, and a model for mass users (Figure 8).

- High resolution model: This information is the basic information for scientific-historical analysis and historic documentation, with a resolution of 1 point each 3 millimeters. This kind of information changes the heritage analysis, as the new technologies and process allows us to go deeper in the knowledge of the parts of the building, from characteristics of material (for example material

alteration of an object over time) to structural studies (like deformations analysis). New research opportunities are open describing the current state and the evolution of the heritage in technical terms.

- Medium resolution model: This model allows the exploration of the whole building by non-specialized users. The classification structure is maintained for data accessibility. This information is oriented to users who constantly work with this building. In this case, to the *Museu d'Història de la Ciutat de Barcelona (MHCB)* and *amigos de Fabra i Coats*, who administer the building.
- Low resolution model: This model is made for webcasting purposes, in the process of building a virtual museum buildings online (figure 9 b). With resolutions of 5 and 10cm, with no classification, mainly use for navigation purposes.

Figure 8: Tree levels of information for diffusion

Figure 9: a) High Resolution Model: 917 million points, b) Low Resolution model: 2,3 million points

Point Cloud model viewers are increasingly growing in the industry, as professionals fell more comfortable working directly with points rather than mesh models. We recommend both Meshlab² and Pointools software for visualization purposes. Web point cloud viewers are starting to appear such as

² MeshLab is an open source, portable, and extensible system for the processing and editing of unstructured 3D triangular meshes or point clouds. meshlab.sourceforge.net

cloudcaster³, or XB point stream⁴, all of them allow point cloud navigation and simple measurement in the basic interface.

6. Conclusions

Riegl Laser scanner, time of flight scanner, is not an appropriate scanner for detailed interiors surveys where data obtained is in the 2 to 10m range, as a larger number of points per position are necessary for high detail acquisition. On the other hand, Faro's portability and high number of points in short period of time is the appropriate tool for this type of interior surveys where a measurement every 0,5cm is needed to extract every object detail.

Changes in lighting conditions affect the intensity value directly of the Faro scanner, as well as distance to objects, making this information useless when scan positions are registered. This is not the case while working on single scans information. Riegl intensity value does not have a sensitive change if lighting conditions changes or as to the distance to the objects. Incorporated RGB camera in the Faro scanner, as it cannot be controlled by the user, provides unwanted color images. Texture value coming from these images is very important for a correct 3d interpretation.

Obtaining a high density point cloud model is nowadays a fairly simple task. The discussion needs to focus in two main aspects: how this model needs to be subdivided for an agile and appropriate use, and how many different models need to be delivered for different users and applications. The subdivision of the model presented is far from an automatic classification, as it needs to respond to historical, architectural or program needed. This step is necessary as it adds accessibility to the model. On the other hand, different resolutions are necessary to be generated for the accessibility of the model for different users.

Southeast Asia's Built Heritage at the Cross-Roads – How to Reconcile Tradition and Modernity within Competing Constraints

Ahmad Najib ARIFFIN

Nusantara Academy of Development, Geocultures and Ethnolinguistics (NADGE)

Kuala Lumpur, MALAYSIA

najib@nadge.org and nadge.my@gmail.com

Abstract

Southeast Asia has a wealth of tangible traditions and intangible heritage; where the Malay Archipelago was the key part of the historic Spice Routes, with the city of Melaka (or Malacca, a UNESCO World Heritage Site) being the epicenter of the spice trade - and thus part of Le Vie dei Mercanti.

While acknowledging that the cultural legacy of the Malay Archipelago region is astonishingly rich, it's alarming to see the rapid disappearance of many of its diverse heritage structures and practices; many of which are valuable not just for their intrinsic value, also for their lessons in managing human civilisation.

One example is the timber Malay house on stilts, once common throughout the Malay Archipelago in Malaysia, Indonesia and the Philippines. It was an environment-friendly form of architecture requiring great skill to make but the result was a masterpiece of both form and function that saved occupants from floods, wild animals, tropical heat etc. Yet today this house form is dying out.

Here multiple constraints are at play; modern influx of new technologies, foreign influences, demographics and economic exigencies that affect the built environment and not least the people's own perception against tradition.

However there is a way to reconcile these constraints: it is simply to go back to the root of how these houses came about in the first place. The reasons are still there: the local environment, climate and lifestyle – these lead to the possibility of revitalising a living heritage.

Keywords:

Southeast Asia, built heritage, architecture, architectural conservation, cultural revitalisation

1. Background and Introduction

The region of Southeast Asia has an acknowledged wealth of native as well as foreign-influenced traditions and heritage; be it in the tangible built and physical environment or intangible culture and lifestyle.

The Malay Archipelago and especially the Malay Peninsula, which is today the western half of Malaysia, was a key part of the historic Spice Routes with the port city of Melaka (Malacca, a UNESCO World Heritage Site) being the epicenter of the spice trades – and thus indeed a part of Le Vie dei Mercanti.

In fact, a growing number of international researchers, practitioners and writers in the Humanities and Sciences including history, archaeology and anthropology are discovering that Southeast Asia's Malay Archipelago region has a civilisational existence and historical context that is much older and more extensive than previously thought; as shown for example in the works of Dr. Stephen Oppenheimer in his book 'Eden in the East – The Drowned Continent of Southeast Asia'[1]. Closer to home there are Prof. Dr. Zuraina Majid and Prof. Dr. Mokhtar Saidin's teams of archaeologists whose ground-breaking discoveries have pushed back the earliest evidence of human civilization and networks in the region by literally thousands of years.

Historians, heritage practitioners and cultural researchers who acknowledge the cultural antiquity and built heritage of the Malay Archipelago region as astonishingly rich and mind-bogglingly varied, will also be alarmed at the rapid disappearance of many of its diverse heritage structures, artifacts and practices; many of which are valuable not just because of their humanity and historic value, but also for their environmental and educational lessons in managing human civilisation and the earth.

A simple example is the nail-less timber Malay house on stilts, once common throughout the Malay Archipelago in today's Malaysia, Indonesia, the Philippines and other regional countries. It was a most environment-friendly form of architecture requiring great woodcraft skill to make, but the result was a masterpiece of both form and function that saved the occupants from floods, wild animals and the tropical heat. Yet today, this house form is not only dying out but the existing ones are also rotting away. Here, multiple constraints are at play.

2. Conditions and Challenges

Several issues and problems can be identified that plague the natural continuation and full sustainability of the various types of heritage in the Malay Archipelago countries. This paper attempts to outline them below and share the various ideas in the effort to save this human heritage of native building traditions and even try to make them thrive again.

These conditions and challenges to positive heritage perpetuation include the population's changing perceptions due to modernisation and/or foreign influences, which are not necessarily positive or negative but are nonetheless pervasive; the need for funding in the effort to preserve and continue heritage conservation but which compete with other national economic development and financial needs, especially for these developing countries; the possibility of tourism as a source of funds but which could also be counter-productive if not managed well or if it brings in over-whelming outside influence; and other problems that will be discussed.

Sometimes these challenges are multi-faceted and need the cooperation of many social and professional players and parties. For example the effort to conserve and continue the authentic traditional architectures of the Malay Archipelago require the understanding, agreement and collaboration of property owners and the community or even local neighbourhood; governmental authorities; also funders/financiers as owners frequently have no spare money; specifically-skilled architects, engineers and specialised contractors or restorers or even traditional building craftsmen who are not always easy to source. After all those comes the question how to sustain the buildings' maintenance; maybe through tourism; thus also needed are tour agents/marketers and knowledgeable tourist guides. Do not be surprised that in Southeast Asia at any one part above, the party may not have the ability or even willingness to collaborate. There are various interesting and instructive reasons for this, which this paper and presentation will try to address.

3. Efforts and Effects

There are certainly efforts made in each country such as Malaysia, Indonesia and the Philippines to try and conserve the cultural heritage and stem the tide of diminishing traditions before they face the danger of extinction. Some conservation efforts and heritage items are successful; some are still struggling while some may be lost causes.

Various examples of each respectively such as individual traditional buildings around Malaysia and Indonesia that are successfully saved; or the old shop-house cityscape of Georgetown, Pulau Pinang (or Penang, another UNESCO World Heritage Site in Malaysia) which is in a partly-political struggle for survival, while the quaint and unique Malay village enclave of Kampung Bharu in the heart of Kuala

Lumpur, Malaysia's capital, may already be a lost cause, and tourists are flocking to see it before it is demolished: gone forever due to the pressure of development and lure of monetary gain.

Some of the efforts include local organisations that have advocated certain principles for heritage conservation or preservation of traditions and tourism benefits. Among them are the NADGE/Nusantara Academy's Five Principles for Heritage Tourism, somewhat enigmatically abbreviated in acronym as WF2PA in Malaysia, and other efforts in other neighboring countries as well. NADGE is also working with Malaysia's heritage authorities to help identify for example, traditional building elements that are culturally significant, architecturally meaningful and environmentally useful to incorporate into local modern buildings. A guidebook on this effort is being produced for edition this year, and in a way this Forum is its international 'soft debut' as a critical example of architectural heritage discourse.

Indeed, this paper and presentation as described above hopes to deliver and share the Southeast Asian region's experiences and state of heritage, be it in the tangible or intangible dimensions, its heritage management encompassing local or interconnected history, culture, collective identity, communal memory, and even archaeology that all make up parts of the Archipelago's cultural landscapes.

"History is a valuable guide; heritage is a priceless crown – without which a society loses its way and its wealth". Hopefully this paper records and shares some of the history and heritage that Southeast Asia has to offer.

4. Southeast Asia's Malay House – A Meaningful Heritage

In our haste to embrace everything that is modern or progressive and which may appear advanced and convenient, we sometimes forget and discard previous knowledge, technologies and practices that were very suitable and sustainable to the place and circumstances of where we live.

While some old or traditional architectural practices may be thought of as 'outdated', that is in cases because we have forgotten the overall wisdom that came with the traditions. Yet the modern designs or technologies that replaced them have not truly solved current living problems, and may even create new unsustainable conditions, such as increased air-conditioning use, environmental conflicts and so on.

A new and continuous examination is needed on the characteristics and suitability of traditional architectural designs and practices for modern requirements. This effort also relates to identity, in which the typical contemporary built environment lacks an identifiable image of, say Malaysia or the Philippines, which in many developed countries can still be seen in their built heritage. Yet once we find the relevant elements and usage that are derived from our local characteristics, we may strengthen our built identity.

5. Traditional Architectural Heritage – Malaysia's as One Example

Overview of the historical origins and the cultural and environmental factors that influenced traditional architecture in Malaysia, which has many similarities with others in the Malay Archipelago region.

Malaysia has a very rich indigenous building tradition. Its various forms are born from the wisdom of long experience and exposure of the native peoples to the land's natural conditions and their local cultural framework since time immemorial. It was thus highly suited to the region's environment; using organic materials in sustainable ways and responding to lifestyle practices that did not waste, and as such respected the earth.

It is unfortunate that this wealth of traditional architecture is not widely recognised nor duly appreciated with more study and utilisation of its beneficial features.

In fact, nowadays one would be hard-pressed to find traditional houses in original forms in urban areas in Malaysia anymore. The dwindling authentic houses that remain are seen only in the *kampung* or village areas. Many have been modified with ungainly modern extensions, while so many utilise corrugated zinc roofs – making them unfairly look like poor squatter houses instead.

This is really a pity as the true traditional houses of Malaysia were actually intelligent buildings and part of a wider environment-friendly way of life. It is essential that architects and builders practicing in Malaysia recognise why and how this is so in order to continue a consciously sustainable tradition.

Before the arrival of foreign or modern influences, the local peoples of Peninsular Malaysia and their related indigenous tribes of Sabah and Sarawak had already highly evolved their traditional dwellings with forms that excellently suited their lifestyles in the tropical environment.

Whereas on the Malay Peninsula single extendable family houses were the norm besides palaces and mosques, many of their cousins on Borneo island also built *Rumah Panjang* or 'long-houses' hosting a string of family dwellings in one complex, each in its own 'apartment' with a common multi-purpose verandah linking the front called '*Ruai*'. Designs and concepts were rarely exclusive to just one area or group and there were many shared elements across regions and sub-ethnic groupings.

After all, it should be remembered that before "Independence" there were no national divisions between Malay Archipelago countries such as Brunei, Indonesia, Malaysia, Philippines and so on. Among all the distinct but related native ethnic groups across the region, there were no fixed man-made borders and movements between people and their ideas were fluid, without being nomadic.

Seafaring and traveling for trade and cross-migration were very common. This sailing affinity is even reflected in some of the traditional architectural designs and terminology such as *tebar layar* (unfurled sails) and *pemeleh* (carved oar), which are shared with navigation and sailing elements.

In explaining this 'movement culture' phenomenon, the Historian and Researcher T.N. Harper[2] wrote, "The civilisations of the Malay World are founded on movements of people rather than the settled accumulations of population."

This observation encapsulates why the Malay World needed relatively few cities to sustain its civilisation of a well-organised society with states and kings, religious cohesion and prescribed laws plus writing and trading long before colonialism. The city of Melaka was one of the exceptions that prove the above rule, since no comparable city was needed to maintain civilisational continuity even after it was lost to invading foreigners. Also, the Malays' lack of long devastating wars among themselves is why stronghold structures such as stone castles were rarely needed.

These factors above also explain why buildings were somewhat 'impermanent' by modern standards i.e. made of wood and other organic materials (not stone or brick). Even then these wooden buildings were purposely designed as prefabricated timber structures that can be dismantled, or even carried around. Thus once these houses were made, their usage was maximised with minimum waste.

Yet when their houses or even whole settlements had to be abandoned, being of wood and organic materials, the structures would simply biodegrade and return to pristine nature over a relatively short time, leaving no trace whatsoever of having hosted native human habitation. This is, for example, why it is difficult to locate evidence of old Malay trading centres mentioned in historic accounts but no longer exist today. Traditional Bumiputra (Malaysian term for 'indigenes') organic architecture fully returned to nature.

This is the historical background of our traditional architectural heritage, much of which is now lost, forgotten or misunderstood. It is the history of a society that was mobile and yet at the same time was rooted to the land, that respected the earth and the impermanence of life and yet had developed an artistic and architectural culture that had sustained them and the land untainted over the ages.

6. The Built Environment

Malaysia, like much of the rest of its shared Southeast Asian co-cultural region, is located in a hot and humid equatorial zone. Vast and thick jungles of stunning floral and faunal diversity cover every inch of land right up to the beach and even beyond the shores, such as the mangroves in coastal water.

Rainfall is very high, no less than 2.5 meters per annum, with floods common as rivers regularly overflow. Impermanence was expected as Malay proverbs attest:

Sekali air bah, sekali pasir berubah
'Once the flood comes through, the land changes too'

With thick rainforests surrounding them everywhere, it was natural that tropical people would use the readily available jungle resources to build their dwellings.

Using these replenishable natural materials i.e. various kinds of local hardwood timber such as *cengal*, *merbau*, *meranti* and other species as well as bamboo and rattan, the native folk moulded their houses and their lifestyles in a way that respected the Earth more than any other settled society in the world. So much so that their organic houses fully biodegrade or disappear if they were neglected.

Responding to climatic exigencies, traditional timber houses also incorporate design principles still relevant to contemporary architecture such as minimising conflict with nature and maximising ventilation and shading; qualities easily seen in the house's basic features as described in the following sections[3].

6.1 Living on the Air, Just Touching the Earth

A main characteristic of a typical Malay *kampung* or village house includes the obvious fact that it is raised on stilts or columns. There are at least six advantages for this:

- to be above flood waters,
- to avoid wild animals and creepy-crawlies,
- to enhance ventilation,
- to deter intruders and thieves from easily entering,
- to become a sheltered storage area, and
- to act as a day-working area below the house.

The fact that the house is elevated, called “*panggung*” style (meaning ‘platform’ or also ‘theatre’), is indeed very environment-conscious.

For instance, in one stroke of elevating the house, contact with wild animals from tigers and snakes to centipedes and scorpions is greatly lessened. Being raised, the houses also did not impede the movement of wild animals who have the right to roam the earth too. Yet plants such as certain herbs and vegetables can still be grown to a certain extent beneath the house.

Thus conflict with nature is minimised.

One can make a point that the inhabitants basically ‘live in the air’, occupying a space where there was none, with only the tips of their house - the stilts – touching the soil. This shows great respect for the *Bumi* (the Earth), by covering minimum surface and disturbing the land as little as possible.

6.2 Unwelcoming the Heat, Celebrating the Roof

For ventilation and dissipation of heat, the elevation of the traditional house into the wind’s path and also its many windows, perforated carvings and slatted panels around the walls plus the high ceiling roofs made of woven thatch or light clay tile all contribute their respective cooling effects.

The roof plays a huge role in the prevention of heat build-up as well as rainwater dispersion. All traditional roofs are *always* pitched to quickly drain off rainwater.

Traditional house roofs also always have wide overhangs; critically important for sun-shading and protection from heavy downpours in tropical climes.

The result of this pitched or sloped form and multiple function of the roof is that it becomes a dominant feature of traditional architecture. In other words, as the head-covering or even head of the house’s body the roof thus dominates the ‘look’ of traditional houses.

The thatch roofs, usually made from the prepared woven fronds of the *nipah* or sometimes *rumbia* palms in downward overlapping arrangements, not only physically protect from heat and rain but psychologically give a cooling feel as well.

A similar effect is achieved with the thin ‘*senggora*’ clay roof tiles common in the Malay Peninsula’s east coast. The name is from Senggora which is the original Malay name for what is known as

Songkhla in Thai in today's southern Thailand. Nonetheless these tiles were once made all over the Peninsula's East Coast region.

The senggora tile is purposely thin for at least four reasons: it is light to carry around, it would not burden the weight of houses on slender stilts, its thinness reduces its heat absorption and re-radiation capacity that thick roof tiles have, and if damaged it could be more easily removed and a replacement piece slid in; all very practical and environment-conscious qualities.

However the popular use of exposed zinc sheets, because of its ease of installation and cheap supply, unfortunately increases heat and is noisy during rain. Nonetheless, in the early years of the nation's development it served its purpose of being a time-saving and economical cover over one's home.

The traditional roof eaves, in many cases have beautifully carved timber eave-pieces or boards (called '*papan cantik*' and other names) to decorate the visual connection between roof and sky, and also contribute to the cooling feel.

Some roofs hold attic rooms called *lenting* or *loteng* as in many Melaka houses; effectively making the already raised structure a three-storey edifice. This is no surprise as even in the 15th century, the Melaka Sultan's palace was a six-storey edifice built entirely in nail-free timber.

6.3 Materials from the Surroundings; And No Need for Any Nailings

Using hardwood timbers that were locally available and regrowable, the traditional folk engaged expert *tukang kayu* or *tukang rumah* (wood or house craftsmen) who manufactured structures in such a way that they did not need a single nail, and was in fact a prefabricated building system.

Instead the Malays used an ingenious system of pre-cut holes, wedges and dowels called '*Tebuk, Selak dan Pasak*', among other names. These holes or openings need to be precisely positioned and made on the pre-measured timber pieces to fit the building elements into one another, effectively making it a 'prefabricated house'. When all the timber elements were ready; cut, holed and grooved, the pieces would then be brought to the pre-determined site and by tradition, or even taboo, the main structure needed to be raised with the pieces slotted into each other up to the roof cover before sunset. This was simply to prevent overnight rain from soaking the structural pieces and potentially damaging its material integrity.

In Sarawak and Sabah *rotan* or rattan ropes were used to fasten pre-cut-and-grooved bamboo pieces that were fitted together, a system called '*Tarahan Tanggam*'.

Interestingly these were thus all precursors to what is now touted as IBS, or *Industrialised Building Systems* that are gaining (or *regaining*) popularity today.

The Malay craftsmen and house-builders knew the qualities of timber inside-out and how wood should be used in their structures. There was very little waste of logs as almost all parts of each tree were used, even down to the leftover pieces used for dowels, wedges, small panels and carvings, or kept under the house for replacement parts.

Houses were built without nails. Although nails had been invented and in some newer traditional houses used for non-structural or supplementary elements, there were benefits of structural flexibility that the rigidity of nailing defeated.

Without nails, a timber house could be dismantled piece by piece, packed up and taken to a new location, as and when the owner needed to move to another place or to sell the house but not the land.

In fact, for short distances, the nail-free flexibility and relatively lightweight timber even allowed a traditional-style house on stilts to be lifted on many shoulders through '*gotong-royong*' (community cooperation) and carried to another spot.

7. Principles & Issues on Heritage Architecture in Modern Use

This discussion centres on the principles of usage and main issues and difficulties in heritage infusion.

The desire to continue a society's traditions, in our case in architecture, is a universal one.

If a society's traditions are not overly disrupted by new changes such as from foreign influences and/or the introduction of radically different technology, the tradition may evolve accordingly. However in most cases the changes are new and radical, as in most Malayo-Polynesian cultures where the architectural transition involved traditional nature-based materials and craft technologies to a modern industrialised and even synthetic context.

The matter can be quite complex, as it involves not just materials and design but many other human factors such as patriotism, politics and so on. The typical result is a certain level of confusion through the differing attitudes and approaches to the issue. There would be many different interpretations on how to continue tradition and identity in the face of new challenges and changes from the traditional ways to the modern onslaught, which can't be ignored.

Different people will have different arguments and levels of acceptance of the various approaches in handling the matter of continuing and infusing tradition in buildings.

A term that is used in this kind of discourse is 'vulgarisation', which refers to the improper, (hence 'vulgar' as opposed to 'rude'), usage of an element from one context to another.

In our discussion it refers to the 'improper' use of traditional architectural elements in modern contexts. This is subjective and is a long-standing argument that exists everywhere there is a prior architectural tradition, even in the West where the Post-Modernism movement provides one of the many discourses on this issue.

For some, using traditions in any different context from the original is charged as 'vulgarisation', as in translating traditional Malay timber architectural designs into modern concrete buildings. Yet these detractors have no qualms about seeing alien elements from non-tropical cultures or temperate innovations from the modern West plonked into an intensely hot and rainy equatorial context.

Thus we have Neo-Classical European façades or modern unprotected surfaces open to the hot sun and windy rain, bulbous domes with ugly water-streaks or modern open walls discoloured after a short while, and expanses of unsheltered glass baking their interiors if no artificial cooling is exploited. The same goes for decorative items such as alien or modern 'feature elements' jutting about with nil or dubious meaning.

Some argue for clean modern architecture or some amorphously similar concept. The issue about "clean modern architecture" is that when the inevitable tropical dirt-stains, water-lines and fungus or mold stain the building; it has no carved mouldings, human-scale elements as in framed windows or meaningful carvings nor importantly a "sense of place" to keep it from being, yes, outright hideous.

Indeed, in all architecture before the early mid-20th century's industrialism one can feel the human craftsmanship or artistic touch. This is absent in the HVAC-heavy industrialised modern boxes of today.

Yet much of these above improprieties are 'accepted' as part of progress, modernity or even 'diversity' but why not the cooling traditional roofs and adorned overhangs, or other local tried and true elements born of the land and friendly to the enviro-cultural context.

8. Current Conditions and Utilisation of Tradition

In this age of modernity and globalisation with modern culture and 'world architecture' permeating the planet, more and more voices are calling for a stop to the spread of near-identical, industrial-looking concrete boxes that rid our cities of any sense of local identity.

It may not be that practical or desirable at present for us to build completely in timber and bamboo as before but these materials are regrowable, so it's a matter of replanting them – exactly as our ancestors in the Malay kampungs did by planting a tree for every child born.

In any case, we can still use our timber or bamboo heritage for select buildings in modern ways (two vastly different examples of this come to mind, Galeri Glulam in Johor Bahru, Malaysia and The Green School in Bali, Indonesia) OR use traditional elements in contemporary buildings of modern materials.

Most aspects of traditional Malaysian architectural designs are very environment and climate-friendly, not only physically but psychologically as well, as they promote both the practice and propensity of safety, shelter and shading; as in not just overhanged roofs but also the *cucur atap* or *papan cantik* that elicit the feel of shadow and coolness. Indeed all traditional Malay-Bumiputra architecture with its pitched roofs, wide overhangs and even being raised on stilts is very eco-friendly.

Thus the 'vulgarisation' of architecture, meaning when a modern building takes on 'traditional' designs that are 'unsuitable', is actually not as big an issue as it is made out to be when the usage fits the enviro-cultural context of the place.

But this is also subjective, wherein some accuse that using traditional designs in modern Malaysian or Indonesian buildings is vulgarisation, as that depends on how it's used and also its context. These same critics then love modern or Western elements in local buildings, which are worse as they're alien and many are not environment sensitive.

Thus as long as the traditional architectural elements fit the enviro-cultural context, physically and psychologically they can *not* be accused outright as architecturally vulgar or improper.

After all, and most of all, the traditional forms of Malaysia's Malay-Bumiputra architecture are actually very universal. The forms exist in many other distant cultures, such as the *Bumbung Panjang* long roof, *Bumbung Limas* gabled roof or the *Bumbung Meru* pyramidal roof with finials and so on. So much so that sometimes they are claimed to be influences of others, which in fact reinforces their universality and usability.

It is alright to have a diversity of other and all types of architecture in our urbanscape, but it is a sin to dismiss our own homegrown architectural styles, elements and embellishments that can give a traditional identity to our buildings and cities, and so prevent us from being just another concrete jungle with modern boxes that can be plonked down anywhere in the world.

There is such a large variety of traditional designs, elements and components that the menu of usable choices is large enough to allow different configurations, combinations and heritage-based inspirations to give each building an identity, just as each of the real traditional buildings themselves had.

While the heritage infusion in buildings may not be liberal or literal, it would need to be enough to engage and elicit a sense of recognition in the people, as well as to foreign visitors who like to feel that they are in a place with a sense of heritage or identity that they have come all the way to see.

It is thus left to the knowledge and intellect of all stakeholders, from Architects to building owners, to interpret and find beneficial use of our rich traditions in architecture that also appeals to their users' sensibilities. Here again, the logic of environmental consideration that traditional forms took on would be a first line of thinking in this effort.

8. Summary - Principles of Usage and Incorporation of Tradition in Modern

In the Malaysian or even larger Southeast Asian context, we can employ rational analysis in finding a way to meaningfully utilise our architectural traditions and avoid overly argumentative confusion. The way to rationality simply involves thoughtful analysis of these questions:

- What was the context of the traditional use of materials and forms in architecture?
- How are they still relevant in the contemporary situation?
- How can the usage of traditional concepts help our environment?
- How can the usage of traditional architecture help our economy?
- How can the usage of traditional (architectural) values help our built environment or even nation-building?

With thoughtful consideration and consensus on the above, the way forward in benefiting from our traditions in architecture, or any other heritage matter, becomes much clearer.

Illustrations

Fig. 1: An authentic Malay house in the Melaka *Bumbung Panjang* long roof style, with *nipah* palm attap roofing and *tebar layar* at the gable ends. The roof space holds an attic floor, which in the old days was used as a bedroom for maidens of the house or to store household assets. Modern buildings using this form can have the water tanks in the roof.

Fig. 2: Istana Seri Menanti in Negeri Sembilan, Malaysia is believed to be the oldest and tallest traditional timber palace in the world; at over 100 years old, it is now a royal museum and plans are afoot to apply for listing as a UNESCO World Heritage Site.

Fig. 3: The Royale Chulan Hotel in Kuala Lumpur makes a bold statement in its unabashed utilisation of Malaysian traditional elements and overall heritage look in a high-rise context; some may argue over the 'appropriateness' of the usage but undoubtedly it makes a clear statement of its identity and sense of place.

Archaeology and Architectural Design Project for Alexandria in Aria-Herat (Afghanistan)

Luisa FERRO

ABC Department of Architecture Built Environment Construction Engineering, School of Civil Architecture, Politecnico di Milano, Milan, Italy
Luisa.ferro@polimi.it

Abstract

Herat founded (or re-founded) by Alexander the Great, capital of Timurid Kingdom (1405-1506), oasis-city along the silk trade-route played a decisive role in the Islamic Art. Now is a devastated country. The salvation and the preservation of its cultural heritage is one of the tasks which international community must be faced.

The project proposed, therefore, from a full concept of cultural heritage, wants to build an open air museum *promenade* capable of detecting hidden forms of settlement and landscape and offer potential alternatives to architecture. Starting from the ancient cisterns, the citadel, the old fort and the area of the Timurid Musallas the project creates an urban archaeological itinerary: rather than be an obstacle, archaeological remains provide an excellent opportunity for developing a coherent contemporary project design.

The museum tour-landscaped and re-unification of archaeological sites (new excavation areas) is built through a structured path that restores the visual relationship between the heights, creating new relationships between the archaeological sites and city.

Besides, the presentation introduces an architectural design project for the Gohar Shad archaeological Park and for a new building complex around the Husseyn Bayqara minarets (UNESCO heritage). This area have not yet completely investigated is presented as a vast and fascinating stretch of land from which emerge ancient fragments and traces of three large enclosures.

Keywords: Archaeology, Alexandria in Aria-Herat, Husseyn Bayqara minarets, Open air Museum, School of Art and Craft

1. Archaeology and Architectural Design

What gives us archaeology is a complex mechanism in which design is seen immortal intelligence. Start from this is to discover the laws of things, knowing "the spirit that comes out of places" (Aristophanes, *The Clouds*).

We try to trace what returns from the ground: the former was constructed so that the parts functioned properly, with only the necessary accessories and their placement area, nothing was out of place even when expressed with apparent randomness. A set which is multiple without disorder: temples, statues, gardens, columns, capitals, regulated and open spaces. Then there was also a substantial component: the Providence, the wisdom that is to maximize the potential of a place (Strabo, *Geography*). So the architectural types (figures travelling throughout the Mediterranean and the East) were arranged and combined according to rules made directly to the place where they had to rise, the figures entered in the cycle of metamorphosis and fed the contemporary, keeping within itself the formal

character of the matrices from which they came, matrices that live deeper in the folds of the collective consciousness.

But mind you the contemporary design is neither nostalgic nor reconstruction, because of performing arts of antiquity there are traces of a life that once was full. Too much wealth of phenomena and original atmosphere has vanished with the collapse of time. The ruins are part of a whole that no longer exists.

Ruins and fragments open up for us new possibilities and the architectural project is not the reconstruction of something lost, is (again) its metamorphosis.

The project brings together the fragments, builds relationships unimagined, governs the objects according to a lyrical scansion, a wavelength of composition. Generates new rules, measuring things with the same number using an ancient discipline: rigor tempered by the imagination that creates juxtapositions apparently unheard. Returns, finally, the real meaning of belonging to another reality, unknown, but belonging to the origin of ideas in architecture and with whom it would seem necessary to innovate, confront again [1].

2. Archaeology and Urban Project

The excavation is no longer avoidable, it is one way to know of modernity, however, it can feel like a run, an obstacle in everyday life and in the construction of the city. But how is it possible to devise new strategies of cross-protection, enhancement and use of archaeological sites and what can be a good way to organize the results of the search for physical traces of history in the urban centres.

In the recent works of refurbishment of archaeological sites is often revealed a broad program of excavations, through which the sites are hit by a process of transformation without the project.

The objective of intertwining the point of view of archaeology with that of architecture is taken as a grounds for investigating the theme of a project conception in its relationship with the stratification of the city, considered as a field for research of a profound and hidden order of things and forms.

Rather than be an obstacle, archaeological remains provide an excellent opportunity for developing a coherent project design, especially in urban contexts: archaeological excavations rediscover artefacts and ancient contexts that re-emerge as “new” components for the architectural project.

The problem of protecting the historical and natural landscape from the present uncontrolled urbanisation is an urgent one.

In forecasting a future development for Ancient and its surrounding area, presents difficulties that arise in assigning a role to archaeological sites can be met with a project for an itinerary covering the city’s museums. Posing the question in this way, the aim of such a project would be to recreate a hidden compositional unity, following open air museum itineraries, thereby restoring significance to single finds severed, until now, from an earlier and more complex context to which they once belonged.

As in excavation, the project isolates single objects from their context layer by layer, restoring its renewed significance, immanence of the antique being thereby embodied within the reality of the project. Following this line of thoughts, the aim of this specific project is to envisage an “archaeological promenade” following a sequence of ruins and monuments at present detached from a context to which they originally belonged, re-arranging them to enhance their significance.

Further, the chosen places of significance constitute the key points of the urban plan worked out on a metropolitan multi-disciplinary museum-school itinerary able to express the structural features of places. As simplified by Alexandria Museum, the word “museum” thus came to mean a place devoted to study and learning.

Following is introduced a recent and on-going experience carried out in prominent archaeological places of Herat, city founded (or re-founded) by Alexander the Great. There the museum-itineraries follow the matrix route of foundation and as in great *collage* - there are excavations, ruins, the archaeological finds. There are also the fragments of townscape, theories of art and ideas of architecture, modern contemporary projects.

3. Alexandria in Aria-Herat

Herat is the only city in Afghanistan to have largely retained its traditional form. The name itself, Herat (or Harat), derives from the same Iranian root as 'Aryan', from which 'Iran' also derives, presumably reflecting the early movement of Iranian tribes from Central Asia into Iran in the second millennium BC. Thus, it appears under the name 'Haraiva' in the sacred writing of Zoroastrians in the late second millennium, and it became a provincial Achaemenid capital of the same in the mid-first millennium, known as 'Aria' to the Greeks after the conquest of Alexander. So far, the Iron Age or Achaemenid origins of the city have not been confirmed by archaeology, although an Achaemenid cuneiform cylindrical seal was found by chance in or near Herat in the early century century. However, both the Qal'a-I Ikhtiyaruddin and Kuhandazh are on large artificial mounds which, if excavated, might well reveal the ancient city. Herat remained a provincial capital during the Hellenistic, Parthian and Sasanian periods. There are detailed descriptions of the city by Early Islamic geographers from the ninth century onwards when it became one of the more important cities of the eastern Islamic world. Herat became a capital city of the Ghurid Empire from 1175 to 1221, along with Fīrūzkuh in the mountains to the east. It was destroyed twice in the Mongol invasions in the early thirteenth century, but after 1244 there was some revival under the local Kart dynasty who ruled Herat on behalf of the Mongols. Its greatest period came after 1404 when Shah Rukh, the son and successor of Tamerlane, moved the capital to Herat from Samarkand. This was the city's golden era, being embellished with many spectacular monuments by Shah Rukh, his wife Gohar Shad and their descendant Hussayn Bayqara. In 1507, Herat fell to the Uzbeks when much of it was devastated. The city's greatest architectural ensemble, the Musalla complex outside the walls to the west, were largely blown up in 1885 at British instigation as part of defensive preparations for a threatened Russian invasion, and considerably more damage to this and other monuments were inflicted in the fighting following the Soviet invasion of 1979.

3.1 Morphological urban matrix

The basic principle of the new towns by Alexander the Great and his successors (the Seleucids in particular) and the new cities that differ from those earlier Greek (erroneously identified as Milesian, but rather different in some fundamental aspects) is the construction of a single longitudinal axis origin of which the whole system of functional and spatial subdivision provided the foundation project.

In the repetition of standardized units of *Gran Via* - the longitudinal original matrix route - becomes supreme act of the foundation and an autonomous architecture. The place of aesthetic effects combined between buildings and landscape.

In the East the Afghan cities founded by Alexander in their original morphology assume a symbolic aspect that adapts to the Buddhist culture rooted in place for some time. It is known that Alexander was the first to promote the emergence of cosmopolitan cities and are carriers of convergent traditions: Hellenism from the west, Buddhism from the east.

So foundation matrix route no longer represents symbolically the founder, but the diagram of the universal order, the particular cosmography that represents Afghanistan as the end of the World.

Herat, as well as Alexandria in Arachosia (Kandahar), Alexandria in the Caucasus (Begram), Alexandria in Bactria (Balkh in the Hellenistic re-founding) are built on an orientation matrix axis. This axis as the so called Canopic route of Alexandria in Egypt is the *plateia* of the city along which stand public buildings.

The legend of Alexander is sent in the Qur'an. And so during the Fifteenth-century Timurid empire, the new capital Herat is redrawn in the myth of Alexander. The urban design reinterprets the Hellenistic foundation assuming the shape which is still recognizable (and largely unchanged in the existing urban morphology of the old city). The squared general plan (about 2kmx2km) is characterized by a north-south matrix axis through the walled city which connects with the monumental outdoor areas (Timurid Musallas and Madrasa) and the famous gardens of delights described by Babur the last Timurid king and the founder of the Empire of India. A secondary axis perpendicular cuts in the geometric centre of the city's main axis dividing the urban fabric into four quadrants.

3.2 The Musalla Complex

Most of the city's important monuments lie outside the walls. To the north are the very fragmentary remains of a particularly elaborate ensemble collectively known as the Musalla Complex, once described as one of the most magnificent architectural ensembles in the Islamic world. Much of this was deliberately destroyed in the 1880s. These are the remains of three separate buildings. The first is the Mosque of Gohar Shad, of which only the north-western minaret still survived into the present, the finest of surviving minarets in Herat. Immediately to the north is the Madrasa and Mausoleum of Gohar Shad, of which only the mausoleum and the very further damaged by artillery. The Mausoleum is covered with the distinctive Timurid fluted dome and the interior has fine painted decoration, but it sustained extensive damage from shelling in the 1980s, with most of its tile-work lost. The third buildings is the Madrasa and Mausoleum of Husain Bayqara. Only the four corner minarets still stand, all of them originally covered in faïence tilework of the finest quality; of the Mausoleum and the remainder of the Madrasa, not a trace survives. Following extensive bombardment in the area in the 1980s, the four minarets are still standing but have now lost almost all their tile-work, and one of the minarets has been punctured by shells.

Fig. 1: Concept plan of the project for the Musalla of Huseyn Bayqara, The school of Arts and Craft of Herat and the archaeological site.

3.2 The Historical-archaeological promenade and a project for the Hussein Bayqara minarets

In the general context of rebuilding the devastated country, the salvation and the preservation of its cultural heritage is one of the tasks which international community must be faced. Along the main ancient axis (N-S) starting from the cisterns, the citadel the old fort and the area of the Timurid Musallas the project creates an urban archaeological itinerary, a sort of built itinerary where the works of arts could dialogue with the architecture, both inside and out: the culture and typology of architecture and of settlement itself are necessary and specifically involved.

This main route axis becomes an open air museum promenade to be considered as an engine for a future general plan of development and restoration of the city, but also to be understood as a itinerary of culture, in a larger meaning as well as in Alexandria (Egypt).

The milestones of the promenade: the domed cisterns, the larger ones which stand near the crossing of the two matrix routes; the immense fortress-palace of Qal'a-i Ikhtiyaruddin standing on an artificial

mound, probably incorporating earlier archaeological remains, covered by fired brick glacis. Following the Unesco project report (by architect Andrea Bruno) the lower buildings restored could become Herat Archaeological Museum. Outside the ancient city walls the large artificial mound known as Kuhandazh, which probably represents the (never excavated) remains of the pre-thirteenth century city. On top are two monumental Timurid Shrines. The promenade comes to an end at one of most astonishing landscapes: the famous minarets of Herat. The very fragmentary remains of the Musalla and Gohar Shad and Hussein Baiqara complexes have been part of the three elaborate ensembles once described as one of the most magnificent architectural buildings of Islamic world; all deliberately destroyed by English army in XIX century and further damaged by recent fighting.

The project, therefore, from a full concept of cultural heritage, wants to build an integrated system of places and paths capable of detecting hidden forms of settlement and landscape and offer potential alternatives to the architecture. Morphological characteristics of the area, water availability over time have allowed the spread of crops and gardens of delight, to be supported and regained.

The museum tour-landscaped and re-unification of archaeological sites (new excavation areas) is built through a structured path that restores the visual relationship between the heights, creating new relationships between the archaeological sites and cities along a route that follows the old matrix route, the supreme act of the Hellenistic foundation.

The research introduced aims to elaborate an architectural design for the Gohar Shad archaeological Park and for a new building complex around the Hussein Baiqara minarets: library (in connection with Bibliotheca Alexandrina), centre for the development of handicrafts, the girls' school of arts and crafts, the palace of brotherhood and tolerance.

This area have not yet investigated is presented as a vast and fascinating stretch of land from which emerge ancient fragments and traces of the large enclosures.

The new school will evoke the Iwan, the monumental entrance to the enclosure Timurid complex.

Along the promenade lined gardens will repair from a merciless summer sun, creating shadows and infusing the *mezzaombra* characterizing the performance of legendary landscapes, surrounding the visitors in the magic of myth. In excursions *en plein air* views are never natural, immediacy and linearity of the tracks is a function of memory. What we glimpse again, what has impressed in the form of the place and reappears through the project, open angles, opens scenarios, create relationships between differences and does belong to the same view [2].

Research Team group: proff. A.Torricelli, L. Ferro (coordinators), Dipartimento di Progettazione dell'Architettura, Politecnico di Milano with the Architects Viola Bertini, Elena Ciapparelli, Giovanni Comi, Davide Grazi, Maria Luisa Montanari, Sara Riboldi, Gianluca Sortino, Valerio Tolve.

The production and scientific research is closely connected to teaching knowledge and methodology in its intentions, also finding time processing in the Scuola di Architettura Civile del Politecnico di Milano (Laboratorio di Progettazione 3, Luisa Ferro e Laboratorio di Laurea Magistrale, Angelo Torricelli, Luisa Ferro); in practice activities of Dipartimento di Progettazione dell'Architettura and in the Ph.D research (Milano, Venezia).

Subjects and case studies (Atene, Campi flegrei, Milano, Villa Adriana Tivoli, Alessandria Egypt, Alexandria in Aria Afghanistan) have been introduced in several international seminars, workshops and publications.

A settlement of the Knights of Malta in Campania: the *Castrum* of Cicciano (Na)

E-mail: mariaarchetta.russo@unina2.it

Abstract

Among the possessions of the Order of Malta in Campania, the Commandery of Cicciano, a town near Nola, in which it was the hamlet until the beginning of the fourteenth century and the fief of the Knights of St John until 1816, was of remarkable importance.

During the fourteenth century, the small site, documented in previous decades, grew in importance so that it became a masterful Commandery, being directly subjected to the Grand Master of the Order.

It is at this stage, in a position of barycenter compared to the existing village, consisting of small scattered centers, that a majestic fortified citadel was erected surrounded by walls and towers and surrounded by a moat. Inside, presenting the contemporary model of the settlement of Rhodes, a fort-residence of the commander, the church, the utility rooms and several houses were planted.

All this not only led the small town to get a prominent position, but it set the basis for following territorial expansions, that in the long run led to his welding with the original centers, forming an organic urban fabric.

Despite the suffered tampering, the *castrum* is still the greatest architectural and urban emergency in modern city. Its conservation can leave out of consideration neither the historical events that have produced it, nor the different phases of construction, through a critical reading of today's structures, which we intend to carry on in this study.

Key words: Order of St John, Order of Malta, Commandery, Late medieval fortifications, Agro Nolan.

Introduction

The Order of the Knights of St John of Jerusalem, of Rhodes, of Malta, today known as Sovereign Military Order of Malta, was founded at the end of the eleventh century to help the pilgrims in the Holy Land. After a few years, it also took on the role of defence of Christian places against Muslim attacks and of support to the Crusaders, turning into a military association that quickly rose to great international power, thanks to generous donations and incomes granted by the most influential figures of the time.

In order to support the travellers in the best way during their long and difficult journey to Jerusalem, the Knights opened throughout Europe, along the main roads and close to the main points of embarkation, *domus* for the reception, including churches, homes and taverns which formed the basic cell of the organization.

The tick network that formed in this way imposed a hierarchical arrangement in preceptories or commanderies, belonging to a priory or bailiwick, on its turn subjected to one of the eight "provinces or langues" in which the religious community was divided (Provence, Auvergne, France, Italy, Aragon, England, Germany, Castille) [1].

There were many assets in southern Italy, divided into grand priories of Barletta, Messina and Capua, the largest one that was documented in 1185 and including the *Terra di Lavoro*, the Principalities Citra and Ultra, the County of Molise and Abruzzi [2, 3].

After the fall of Jerusalem and the loss of Acre, the Knights settled in Cyprus and from 1309 to 1522 in Rhodes. After having been expelled from the island, about eight years later, they were granted by

Charles V the Maltese islands, where they had been staying until the Napoleonic invasion of 1798, which marked the end of their military supremacy and the survival for the only charitable purposes.

Since the Byzantine period, Rhodes had been composed of distinct zones: at the high level, the *castrum* or *collachium*, downstream, the *burgum* or *chora*. The Knights occupied the highest area, by separating it from the rest of the built-up area through a walling; the main church dedicated to St John, Santa Maria del Castello, the *auberges* of the different "langues", the hospital, the archive and equipment necessary for the community were erected inside; at the north-western end stood the palace of the Grand Master - a compact building with a central courtyard - while in the north-eastern area developed the harbour and the arsenal [5].

The suburban confinement became an almost constant feature of all installations; in particular those of older foundation were built near the city gates and in ports near the beaches, so you can receive passengers at any hour of the day and night.

Instead, in the feuds as Cicciano, that will be after discussed in detail, Maruggio, Casaltremità and Fasano in Puglia, real citadels were created within the built-up area, or in an isolated position, in the style of the monastery of Santo Stefano in Puglia, at Monopoly [4].

1. The Master Commandery of St Peter in Cicciano. Historic-architectural events

In the framework of the southern Italy Jerusalemites settlements, has a great importance the Master Commandery of Cicciano, a town near Naples, not far from Nola, to which it belonged until the first half of the fourteenth century.

The settlement, though little known, is documented by a large amount of correspondence, consisting in the *cabrei*, asset registers, written between 1515 and 1780, which allowed it to have back its fully socio-economic and territorial cohesion.

In these above mentioned acts it is also pointed out the building consistency of the residence and of the nearby urban centre, originally composed of distinct clusters, gradually welded around the complex from the focal position respect to the various villages.

The country, in which there is still the testimony of the Roman presence in some hand-made objects and surviving traits of the *centuriatio*, is mentioned in the tenth century; at that time there was already a chapel dedicated to St Peter [6, 12].

Fig. 1: Cicciano plan. In red, the area of the castle.

It is of the 1292 the earliest news of one of the *domus* of St John, whose location is due to its strategic position on the Via Popilia, the arterial road that connected Capua with Nola, detaching from Appia in Maddaloni and continuing to Reggio Calabria. Along the way the riders had already other sites.

During the next century, the small *domus* grew in importance, becoming the first preceptorie, then priory room subject to Capua, presumably for the addition of some lands that were seized to the Templars existing near there. Not only that, but since 1324, Cicciano did not belong to Nola anymore

and became a fief of the Knights, who by 1384 erected there an imposing citadel. Finally, in 1399, was declared Commandery or Master Room, that is subject to the direct control of the Grand Master, who established its entrusting to important members of the Order or who have distinguished themselves for outstanding achievements in Campania and was second only to S. Giovanni a Mare in Naples.

The fort occupied a particular site: the convergence of the streets Popilia, from N-W, the "Way of Marcello" - branch trending N-S of Appia, directed at Nola through the mountain areas - and those for the neighboring villages of Roccarainola and Avella - relevant at the time - Risigliano and Camposano. The circuit includes a large quadrangle, that took advantage in the east and west of the perpendicular track of the *centuriatio*, and was influenced by the course of the river Clanio in the south and in the north by the oblique course of the above mentioned Popilia, incorporating the existing church of St Peter, from which the Commandery took its name.

The circumstances placed Cicciano in a historical dimension that goes beyond the purely local ones and gives it a role in the general history of the Order. In fact, being the exclusive responsibility of high-ranking within the religious body, it saw the alternation in the regency of three Grand Masters, many priories, leading figures in military organization, excellent characters of international diplomacy, ministers at the Papacy and the Kingdom of Naples.

The Commandery met the greatest flourishing between the sixteenth and the first half of the eighteenth century, but in the second half of the century, even before the Napoleonic conquest, began to decline; in fact in 1792, putting an end to a controversy that had been lasting for centuries, a Royal Decree deprived Cicciano of its status of *nullius diocesis* and brought it back under the jurisdiction of the bishop of Nola. At the fall of Malta in 1798 followed the revolutionary laws of feudalism in 1806, producing the final abolition of the institution in 1816.

Meanwhile, the rich movable and unmovable estate was divided between the Royal Order of the Two Sicilies - established in 1808, the allocation of the assets to the Constantinian Order and Order of Malta - the Curia, who took the churches, the city administration and especially the private sector, which unduly took possession of many properties.

Fig. 2: Planimetric reconstruction of the castrum with the expansion of the moat (by D. Capolongo, *History ...*).

Fig. 3: Cicciano, satellite view of the core with the castrum.

2. The architectural and urban structure through documentary sources

What was the configuration of the *castrum* and metamorphosis which has undergone over time can be deduced from the *cabrei* drawn between the sixteenth and eighteenth centuries, that fortunately came down to us, full of notes, but unfortunately with no illustrations. The complex was placed in the site called "the bridge" - presumably referring to an ancient bridge over the Clanio - in a central position respect the seven cores that initially composed the feud. The possession extended to some places of worship, buildings and estates of the town and of the district and to two taverns, in addition it contemplated the usual feudal rights on the population [6, 7, 8, 9,10,11,12].

Entry was through a single port, defined *ianua magna*, placed on the south side, towards Nola, after crossing a drawbridge - that became of factory in subsequent correspondence - which led into a large courtyard. Around it was placed the *turris magna*, confining on one side with the entrance and on the other with the residence of the Commander, the church of St Peter the Apostle, the prison, a well of spring water, storage rooms and service, cellars. Instead, in the north, we had a number of private homes. All around there were the walls, separated by a moat and, in parallel, from a public road, which contributed further to the isolation from the surrounding area.

The entrance was defended by a ravelin, an advanced structure compared to the perimeter of the walls of a not specified polygonal shape.

The palace of the Commander - defined *fortillitium* by the shape of compact rectangular block - occupied the south-eastern area, with a central courtyard plant that reminded in a smaller dimension to the one of the Grand Master of Rhodes, which was clearly the inspiration of the entire organization. At the beginning of the sixteenth century it consisted of two levels, one at the ground floor, with stables, cellars and storage rooms, and a higher one in which there were the "*sala magna con la ciminiera*", that is, the reception hall and another minor, always destined to citizenship, called "penta room or pintata" as well as private rooms for the citizenship. A century and a half from the building, it still kept its medieval character, with the outer facade crowned with battlements and a "gayfo", a high place, jutting out from the tower.

This exhibition evokes strong similarities probably with that of contemporary as "castello seu Fortellezza" of the balli of Maruggio; in addition, an element common to all residences is the presence of one or more rooms for the people, large-sized, often with chimneys and paints such the ones for example also in Naples and in Grassano.

On the north side you can find the church of S. Peter, accessible from the same yard. The venerable structure had a coverage in part made by vaults and in part by roof and had some chapels inside. On the back, facing on the moat, there was a small garden, while on the side of the sacristy rose the bell tower with three bells, the biggest functioning as well as a clock.

Until the eruption of Vesuvius in 1631, there were little transformations in the complex, registering, besides unspecified operations and the construction of a barn in the west area, only embellishments of the worship building, equipped by his own expenses by the rulers of furnishings and vestments, where they put their emblems in order to keep memory of them.

In the *cabreo* of 1646 the radical works undertaken after the devastating volcanic event are described by the Commander Girolamo Branciforte, who provided for repairs and reconstruction of sacred and civil properties, first of all the *castrum* and the mother church, as evidenced by some of the survivors commemorative plaques there affixed [9].

Inside the fortress he provided for the addition of several rooms both to live and for service, including a cellar on the west side, "very wonderful, divided into two lanes, wide and high in proportion", he covered the entrance door with the spacious vaulted entrance still existing, he replaced the small and ruined staircase that led up to the building with a more spacious and comfortable and restored both the representation rooms. Similarly, he set up a residence for himself, restoring two adjacent apartments that were in bad condition, put in better condition other rooms and formed a lodge. In memory of the works carried out applied his coat of arms on the ceiling of the two public rooms and in the residence. Finally, he added a second large room and a bedroom to the tower.

The moat, now lacking of its defensive function, was transformed into an orchard, as well as the ravelin, which became a pleasant private garden. Below with the help of the university, a huge tank was dug, where waters from Avella were collected, so that it could be used from people and inhabitants of the *castrum*, that could tap into a mouth situated on the same ravelin.

Family coat of arms and learned commemorative marble inscriptions were also set on the door of the cellar and on the well curb.

The church, "ruined and dilapidated for the ravages of time, cramped, almost destroyed from the ashes of the volcano", in 1646, was rebuilt from the ground up, enlarged and lengthened thanks to the rear space of the garden, and covered completely by vaults, with seven side chapels, two of which are worn out and vaulted, while the others were included in the thickness of the walls. The space was embellished with paintings and rich furnishings, while on the back, was erected a "magnificent" sacristy. Even in this case, the reconstruction was celebrated with the marble emblem of the Order on the façade and by a marble plaque and a sign of Branciforte, on the inner side of the entrance.

Further measures in the complex were carried out by 1707, after the terrible earthquake of 1688, and in the third decade of the century. During the first ones they proceeded with appropriate and consistent consolidations and rework and among other things to the addition of a second level in the ancient residence. In the other ones they strove to expand it and make it more comfortable, restyling it with wrapped and decorations and opening up large "fashion" windows [10].

The church, described in detail in the *cabreo* of 1707, was restored and enlarged in 1724 with the help of the population. For the occasion, it was built in the north side a minor aisle composed of a succession of three large chapels, it was dressed the entire space with elaborate plaster moldings and the furniture and furnishings were renewed [11].

For memory, the Commander Giuseppe Maria Cicinelli paint in fresco the shield of the Order on the altar and its staff all around the walls and placed an inscription in marble, that has now disappeared.

The asset just given to the *castrum* was seriously compromised in the second half of the century, when, before 1780, in the absence of the Regent, was occupied by a company of chivalry, which destroyed the gardens and all the embellishments recently completed.

Fig. 4: Cicciano, the courtyard of castro and the church of S. Peter.

After 1806, even before the institution was finally repealed, it gave rise to the metamorphosis of the fortress. In 1810 it was proposed to demolish the walls and fill the moat to expand the open space standing in front of it in order to set there a weekly market. The operation, initially, was banned by the land agent of *Terra di Lavoro*, who argued that the wall protected the complex from the waters that flowed copiously around, but, nevertheless, it was the same carried out three years later [13].

In the following decades, the owners of the buildings on the perimeter of *castro* claimed their right on the slopes emerged by the removal of the fence and got the permission to build above it, towards the now levelled moat. The remaining area is now the house of a wide track that surrounds completely the citadel [14].

The tracking of the road east fueled the desire to provide the church with an independent entrance from this side, desire even heard from him since the sale of the adjacent building, made in 1817. Since the sacred building was in poor condition and was inadequate to the increase of the faithful, in 1814, it was decided to rebuild it. Had not yet been implemented due to lack of money the renovation, in 1819, took charge of the project engineer Bartolomeo Grasso, one of the more technical of the moment. They decided to get the new entry through the sacristy behind the altar, transforming the space into an imposing portico of columns, ended by a pediment, resting on an elevated platform in front of the plane.

In order to compensate for the loss of the room it would have been formed another one by bricking up the arches that connected the first chapel with the next one and the central reservoir; while the bell tower being considered unrecoverable was demolished and rebuilt on the same site.

The plan was rejected by Decurionato, believing that in this way the structure that was already of not suitable sizes will be narrowed further. Among the various solutions of the civic assembly it was realized the idea of making the church symmetrical, by erecting a third aisle on the southern side, occupying the adjacent rooms of the former palace of the Commandery, on the sale of which the owners seemed to agree, after a reasonable compensation. Consequently, a designer was commissioned for a second project, that was delivered in next year and also cast-off in the same way, because they realized that, even though the expenses for the realization had been doubled, however the needs of the population would not have been met [14].

Waiting to have the funds for the reconstruction of bigger forms, the idea was put aside; between 1840 and 1842, we had to proceed to necessary consolidation, which also implicated the raising of the floor. Radical arrangements of the interior were led ten years later by the architect Giuseppe Altieri, who provided for a general restoration, probably erasing what remained of the eighteenth-century paintings. Only after the war it was possible to implement the program pursued in a very long time through state funding and citizens' offers [14].

3. The current situation

The "land that is walled around" still stands out thanks to its compact size in the urban context of Cicciano, of which is the core, which is the meeting point in radial way of the routes from neighbouring municipalities. Even if it keeps its original plant, urbanization all around and the metamorphosis being occurred have profoundly changed the volumetric and environmental ratios by turning the unitary aspect of late medieval fortress into that of a modern block.

In fact, the perspective drawings having an average of one or two floors in elevation show all the ground floors occupied by shops and the upper ones by houses and offices. By their features you can date back to the building phases that could mainly be dated to the late nineteenth - early twentieth century until the last decades.

The progress of the curtains led to the moving back of about 4 meters of the entrance hall and made the only corner tower surviving barely perceptible by the curvature of the south-west corner, while the division of properties caused independent developments in elevation and increases in the planimetry which gives fragmentation and disorder to the entire asset. It was preserved not even the *turris magna*, standing next to the impressive vaulted vestibule introducing the court, whose emergence is cancelled from the homogeneous growth in height of adjacent buildings. Not only that, but the wall above the monumental seventeenth-century stone portal in double ashlar-worked ring results seriously damaged by the decreases of the large central opening, that was divided into two dingy balconies on which the curvilinear tympanum persists, including a plaster scroll with the shield the Commander Cicinelli - symbolized by a swan, subject to the cross of the Order - all being crowned by the stratum of a nowadays storey built on it.

With regard to the adjacent residence of the commanders, it should be noted that the increase in outward has more than doubled the volume.

The old set is accessible from a door open between the base of the escarpment of tower and the original now walled door of the church, still topped by a triangular vault that support the transition to the platform from which the dignitaries attended the religious services. The long and looming vestibule following flows into the small courtyard, around which the rooms are arranged on two levels in the south and east, while the western side is occupied almost entirely by the monumental staircase of the eighteenth-century, the north, adhering to the church, has depth very small and has a portico with two arches resting on a massive central pillar and the upper two rooms surmounted by a terrace. The other two sides with rustic rooms on the ground floor and two levels high.

Fig. 5: Cicciano, view from the west on the southern facade.

Figg. 6, 7: Cicciano, Palace of the Commander. The courtyard and the staircase.

The oldest part on the court huddled factories erected on the eastern and southern perimeter after filled the moat.

The block to the south, towards Piazza Mazzini, consists of ground floor and first floor, closed for the entire course from the terrace where the balconies of the rooms out back. The facade, formally attributable to the early twentieth century, with listature bosses and angular stucco has symmetrical composition, which sees a small portal in the center and two wings advanced to extremes, corresponding to the left, adding to the "*turris magna*", in right, at the head of the addition of cross Corso Garibaldi. The latter, consisting of ground floor and two in elevation, is marked by a double row of balconies lit rooms lined up along the road, with vaults on the first floor, and floor plans, in second.

Very tampered with is also the church, which, ending an affair that lasted for over a century, has undergone a dramatic makeover in the postwar years, with the opening to Corso Garibaldi in 1948 and the completion of the prospectus and the building, next to the modern porch, the bell tower and some rooms for the storage of liturgical furniture and parish office.

Fig. 8: Cicciano, the complex S-E. In the foreground, the former palace of the Commandery.

Fig. 9: Cicciano, Church of St Peter, the current facade of Corso Garibaldi.

Fig.10: Cicciano, Church of St Peter, especially of the font with arms of Commander de Guevara.

The operation resulted in the reverse orientation, with the closure of the original entrance from the yard. At present time, the hall of Corso Garibaldi enters in the large aisle with a lunette barrel vaults that connects through arches on pillars with the three eighteenth century chapels to which is attached one of SS. Sacramento, representing a kind of smaller ship, composed of four modules with vaults.

The opposite wall is still marked by the small chapels gathered from its thickness, of which however, remains only the partition, as on marble altars all of the same twentieth century shape, there aren't canvases and painted panels anymore, but twin niches containing statues.

At the second entry can be seen through a special recess cut in the altar, a chapel planted 2 meters below today's floor and about m 1,50 deep. The basin contains the remains of an altar to the factory, on which rises a pointed niche built into the wall, laying on the bottom of the fresco of the Madonna and Child with two saints in the act of praying and in the soffit of the arch, two other figures standing. In the chapel, part of the original medieval building, it is recognized that "Delli Virgini" which, according to the *cabreo* of 1582, stood to the right of the main altar. The existence is an important clue to reconstruct the plan of the ancient church, whose original length should correspond to that of the first three today chapels of the shorter aisle. More testimonials of the original building, whose traces can be seen also in the room accessible by a door made in the following column, which leads into a small space from the rounded edges, very developed in height and concluded by a small rib vault.

Of the really decorative and chromatic way emerging from documentary sources, which made the reservoir comparable to the Maltese churches, that of course were known to customers for their high rank, we can not found a trace in the today white and bare appearance, enlivened only by the moulded plasters in frames, scrolls, floral decorations and angels' heads on the keystones of the arches.

Nothing remains of the effigies of saints, characters and emblems of the Order and of the commanders painted on altars and walls, while the stone arms still remain, mounted in plaster ovals on the wall, the two set by the Branciforti in the lunette on the door from the inside, as well as the plaque, affixed by the same in memory of the reconstruction of the 1646, was moved to the entrance. The signs and inscriptions once inside the *castro* are disappeared too.

As we have seen, of the precious hand-worked objects offered by the rulers the baptismal font and the font of Commander Girolamo de Guevara have been preserved. In the presbytery, built on the area,

that in the past was of entrance, below the surviving choir - still accessible from the seventeenth-century air passage to the court - stands the post-council altar, while in the middle of the bare partition wall that forms a backdrop is contained the precious case of the holy oil of Commander Carlo Spinelli, turned into the tabernacle.

The radical transformations occurred in the entire asset have unfortunately deleted significant stratification, impoverishing the consistency and depriving citizens of the most important page in its history. It is hoped that the knowledge gained will lead to a more conscious future work of conservation and development, being a complex of great significance, like the most prominent and studied complexes.

The valorisation of Italian rural historical buildings and territory

Valentina CINIERI¹, Emanuele ZAMPERINI²

Department of Civil Engineering and Architecture, University of Pavia

Abstract

The architecture, connected with the rural civilization and building culture, is made with local materials and it originates from the land management needs, therefore the study and valorisation of rural architecture and territory are inseparable from each other.

Territory and architecture are exposed to anthropic and natural hazards: the gradual abandon or abuse of the rural territory favour the hydrogeological instability; on the one hand the abandonment of the historical buildings support their degradation and definitive loss, on the other hand it protected them from distorting renovations.

However most of the Italian territory has maintained yet significant landscape features, whose touristic attraction could be an important economic resource.

The paper considers the architecture and the territory of the Lomellina and of the Piacentine Apennine valleys. The Piacentine valleys are characterized by strong altitude gaps and by a marked anisotropy; the river's course and the routes on valley floors, hillsides and ridges are the main travel direction of the territory. On the contrary the Lomellina is distinguished by an eminently flat country and a dense tangle, made of land ways (main and secondary roads and rural tracks) and waterways (rivers, creeks and canals), which contribute to constitute a substantially isotropic mesh.

Only a careful knowledge of the specific peculiarities of the territories is able to allow a rational identification of the most adequate strategies for the territory access and valorisation.

Keywords: vernacular buildings, rural territory, Lomellina, Piacentine valleys, valorisation.

1. The link between rural architecture and territory

1.1 Local nature of rural architecture

Since ancient times people settled in the Italian peninsula were mostly sedentary and constituted building traditions closely linked to the nature of places and ways of living.

The population's life was based on a subsistence economy, in other words, almost all that was produced was directly consumed or traded for other necessary goods. In this type of economy surplus didn't exist and also in architecture the principle of minimum effort prevailed: the constructions were built with materials available in the area and their morphology was adapted to that of the territory [1]. The need to create adequate living conditions led to design constructive and building typologies that were strictly related with the local climatic conditions. Even the way of living and interacting with the territory was closely linked to cultural and productive factors [2], making it possible to create a balance between optimization of territorial exploitation and conservation of environmental resources [3].

Each territory was also subject to natural changes (e.g. floods, landslides, etc.) that put at risk the persistence of human productive activities and settlements, inhabitants were forced to intervene on the territory with works aimed at changing the hydrogeological regime (e.g. reclamation, terracing, etc.) to create a new balance. This balance was favourable to human life, but at the same time it was unstable: it required the continuous human intervention to remain unchanged, and this intervention was guaranteed by the permanence in time of lifestyles and agricultural production.

The strong links between rural architecture and territory is further accentuated by the lack of commercial and cultural contacts with neighbouring settlement areas, thus creating technical and

architectural cultures that were markedly local. It is for this close bond, formed over long periods of time, that vernacular architecture appears today in perfect balance with the environment in which it is set, and its study and enhancement cannot be dissociated from the knowledge and understanding of the historical territory in which it is located [4].

1.2 Evolution of the relationship with rural heritage

After the mid-twentieth century the Italian population's life styles and technological context changed significantly. Starting from the post-war a process of radical economic, social and building transformation started, the so-called "economic boom". In this period, the industry had a rapid development and agriculture introduced a widespread use of machines, reducing the demand for manpower and leading to abandon the agricultural use of mountain and hill territories.

The increase in demand for manpower in the industrial centres and its decline in rural areas caused mass migration of the most humble population from southern to northern regions, from countryside and mountains to urban centres.

Many social changes (e.g. extension of compulsory education to eight years of study, spread of television, etc.) contributed to the progressive loss of centuries-old traditions and to the homogenization of national culture.

These economic and cultural transformations engendered an evolution of the way of inhabit territory along with a change in the needs of the population and therefore of building standards.

On the one hand internal migration caused the depopulation of countryside and mountain areas with the consequent abandonment of many rural buildings. On the other hand the attraction of modern lifestyles had induced a refuse of traditional buildings and techniques, firstly because their performances didn't reach the modern building standards, but often because there was also the desire of getting over a humble past. Who managed to get rich aimed to build a new house or renovate old buildings, using new technologies, symbols of renovation and modernity [5, 6].

Modern needs engender modern building requirements, which the original design hadn't considered (e.g. plant systems, bathroom and other services, accessibility for all, security, safety). Therefore users have often produced severe architectural alterations, in order to adapt buildings to their needs. These alterations have been caused by a lack of recognition of rural heritage's historical and cultural value and have profoundly affected these architectures mortifying their intrinsic characteristics [7].

This frame of technical social and cultural changes constituted a real anthropological caesura, originating the regret of something that was lost and people wanted to reconquer [4].

The population who moved to the outskirts of cities – made up of anonymous and intensive housing estates, and lacking the necessary spaces for the report – had not been able to create new social relationships on the model of those that characterized historical dwellings. Rural world was idealized and seen as «a kind of lost paradise in which to return sporadically in the hours and days of leisure», because it was considered as a bearer of higher morality, contact with nature, and as far away from pollution and hectic pace of urban life [8].

1.3 Hazards to the preservation of rural heritage

Territory and architecture are exposed to anthropic and natural hazards: the gradual abandon or abuse of the rural territory favour the hydrogeological instability; on the one hand the abandonment of the historical buildings support their degradation and definitive loss, on the other hand it protected them from distorting renovations.

Following the aforementioned regret, in recent decades there has been a growing interest in the recovery of the smaller towns and rural architecture. This recovery process goes through a phenomenon of "re-colonization" to get away from urban centres due to economic reasons and also in an attempt of cultural roots' re-appropriation.

The phenomenon of re-colonization may allow to save rural buildings from abandonment. However, the recovery of these buildings also implies risks for their conservation. A contrast between traditional building features and new ways of living arises, and from it a situation of anthropic risk originates.

It is possible to identify three levels of risk for the preservation of rural architecture and landscape: territorial level, functional level and technological level [4].

Territorial level risks are connected to the reoccupation of rural areas – especially the peri-urban ones – that can lead to the creation of new settlements often incongruous with the morphological and hydrogeological characteristics the territory and with its history and economy: architectures that do not relate neither to the surrounding landscape, nor to the pre-existing settlements' building fabric; new neighbourhoods larger than those of historical centres, that create imbalances and strong contrasts between historical population and productive or commercial activities and the new ones.

In addition, the end of traditional agriculture – that characterized mountains and hills and had created a virtuous balance with them – has led to the gradual abandonment of those lands or to the establishment of cultivation systems deducted from intensive lowland agriculture and not adapted to

the specificity of the territory. The lack of maintenance of drainage systems and terraces and the abuse of soil have led to profound changes in the hydrogeological structure.

To these factors, unauthorized building and unaware (or shamefully colluded with real estate speculation) urban planning must be added, that have allowed the construction of settlements in areas at high risk of flooding or landslides, further aggravating the already critical situation.

Functional level risks derive from a lack of adequate capacity for readaptation to traditional lifestyles. The way we live has changed and this raises the request to adapt old houses to the new needs related to it: safety, environmental comfort, addition of modern toilets and vertical connections, etc.

Technological level risk result from ignorance of the traditional knowledge related to original materials and construction magisteria. Refurbishment work, are often unable to relate to the constructive nature of historical artefacts and to understand it, therefore they involve the demolition or radical alteration of constructive elements. Added to this there is a frequent "functional forcing", for example the conversion to residential uses of buildings with non-residential functions (e.g. mills, dryers, stables porches, attics, etc.). This leads to their profound transformation that requires: dismantling of machines; elimination of unevenness in flooring, of drainage channels, of feeders; change of interfloor heights and superelevation of existing roofs, with the purpose of obtaining a greater number of residential floors or of using as a dwelling even rooms originally with too low ceilings.

In recent decades, the already mentioned socio-economic transformations are also associated with climate change and evolution of global economy that causes the increase in energy demand of developing countries, factors that make energy consumption of buildings increasingly important.

Architecture is therefore undergoing a period of profound technological rethinking, that leads to overcome/reject the myth of energy-consuming plants as the only control instrument for the relation between buildings and external environment. On the one hand there is the obsolescence of the model of building with lightweight and insulated envelope, in favour of the recovery of the traditional model of building with massive walls, characterized by high thermal inertia; on the other hand this creates an additional source of anthropogenic technological level risk: in fact the satisfaction of performance standards established by current legislation is required even to existing buildings, sometimes engendering very invasive interventions.

1.4 Tourism potential of rural heritage and territory

The beauty of Italian landscape – born on the balance between nature and human work determined by the needs of agriculture, and enhanced by artistic representations – became famous throughout Europe at least since the 17th century, so that the Italian journey became a status symbol for European scholars and artists [9].

The high quality of Italian landscape remained substantially unchanged until the country maintained its agricultural nature and its industrial backwardness, when it began to compete with central and northern Europe industrial production, a delicate balance was broken. A building frenzy frequently replaced the thoughtful and often extremely slow changes typical of the past, thus profoundly altering large portions of the multilayered Italian landscape palimpsest [10].

Furthermore, landscape is not static, but changes over time and with the seasonal rhythms, offering possibilities to use differentiated in the course of the year. These changes are connected both to the climate, and to the changes of cultivations that follow it, and they offer food products – as well as rituals and traditional events of rural culture – differentiated according to the seasons.

Many rural areas still maintain, however, significant landscape values, which must be protected from the intrusiveness of private speculation and from the delirium of unnecessary and costly public works, promoted as an instrument for production growth of material goods, but at the expense of the most important Italian industry, in which the nation has probably the greatest increase margins: the tourism industry based on the landscape and artistic heritage.

This industry has differentiated developing ways, according to the area where it operates and that it wants to valorise. In particular, in rural areas the so-called "green tourism" may be developed, which is defined as the combination of «all types of nature-based tourism for which the main motivation of the tourists is the appreciation of nature and traditional cultures» (World Tourism Organization) and attracts all age groups, regardless of their cultural level. Against a decrease in the number of hotels and guest houses, in rural areas non-traditional accommodations (e.g. bed & breakfast, agritourisms, etc.) are spreading. Many small centres located in inner areas – partially depopulated, but with high environmental characteristics – are revitalizing, because the maintenance and enhancement of their characters made it possible to attract visitors and new residents [11].

In detail, tourism in rural context can be distinguished in several types often overlapping each other: relaxation, active rediscovery and cultural reappropriation. *Relax tourism* distances the citizen from the usual work rhythms, leading to a healthier environment. *Active rediscovery tourism* pushes tourist back in touch with agricultural activities and lifestyles, or to retrace ancient trade (salt trading ways) or pilgrimage (Viae Francigenae) routes. *Cultural reappropriation tourism* aims, instead, to a learned

knowledge of traditional rural ways of life and production (e.g. visit to historic rural architecture, museums of rural life, ancient mills and manufacturing centres that are still active, etc.).

2. Rural historical architecture in two areas of the Italian territory

Although the territories are geographically very close, the Lomellina and the Piacentine Apennine valleys reveal particular attractiveness because of the distinct territorial morphologies, which gave birth to different technological and building traditions and to a different relationship between territory and built fabric, that involves distinct ways of valorisation.

2.1 Rural architectures in Lomellina's flat territory

Lomellina is a quadrangular area of Lombardy belonging to the province of Pavia; it is clearly bounded on three sides by natural borders made up of the riverbeds of three major rivers (to the west the river Sesia, to the south the Po, and to the east the Ticino), while to the north it presents a more blurred border towards Novara's area.

The region is distinguished by an eminently flat country and a dense tangle, made of land ways (main and secondary roads and rural tracks) and waterways (rivers, creeks and canals), which contribute to constitute a substantially isotropic mesh. However the current landscape of Lomellina, is the result of the stratification of more than two millennia of human activity (fig. 1).

Lomellina was originally naturally characterized by a series of sandy ridges (generated by ancient fluvial deposits or by the wind). Despite being crossed by important Roman roads (that connected Emilia to the Montgenèvre and the Little and Great St. Bernard Alpine passes, going from Pavia [12]), for its uneven flatness this territory was reclaimed and centuriated in much more limited proportions than the area around Pavia.

During the Middle Ages, Lomellina's territory remained largely wooded or swampy and only between the 11th and the 13th centuries some monastic orders created the first settlements from which to conduct a comprehensive reclamation of the territory; the systematic work of deforestation and water regulation in fact required large amounts of capital that were missing in the previous period [13]. The reclamation works created in the wetlands a dense network of drainage channels that led the water thus collected to the dry lands. The fragmentation of land ownership between large feudal landlords, religious bodies and minor property owners, and complex water rights gave rise to a heterogeneous and articulated irrigation system [14], which required the creation of various types of artefacts for the extraction of water from subsoil (resurgences), for water control (locks, sluice gates, dividers, etc.) and to manage the intersection between the different channels (water bridges and siphons) [15].

Thanks to this complex system of territorial infrastructures a highly productive cereal agriculture – that since the 15th century saw the introduction of rice – developed, accompanied by bovine, pigs and poultry breeding and by water-meadows that produced grass also in winter, thanks to the higher temperature (9-12 ° C) of the water coming from resurgences that keeps the soil at a constant temperature and prevents freezing [15].

Land ownership was mainly concentrated in the hands of a number of large owners who organized its exploitation dividing the territory in medium size allotments, the management of which was given for rent. Such allotments were equipped with buildings – the courtyard farm – in which the residence of the farmer's family was flanked by the employees' houses and by more strictly agricultural buildings: barns, warehouses, stables, etc. Starting from the 18th century there was an evolution of the agricultural land management towards capitalism, with huge investment in land reclamation and in new irrigation canals (which in the course of time allowed to flatten and definitely convert to agriculture almost all the ancient sandy ridges) and the spread of the rice culture [13] (fig. 2-3). The large farms often take on the character of self-contained socio-economic units, with a church, blacksmith's and carpenter's workshops, and since the nineteenth century, also a school [1].

Urban centres are almost all very small and scattered throughout the territory, and they are inhabited mainly by peasants emancipated from their reliance on the work required by capitalist farms. Around the villages the character of the territory changes and it's defined by small grain farms and vegetable gardens [13].

The panorama of the fertile plain was also characterized by the widespread presence of proto industry of the mills for grinding of wheat, rice and other cereals. In Lomellina mills were always activated by a large water wheel (2÷3 m in diameter) and their position was therefore bound to the presence of a hydraulic jump; therefore mills were disseminated throughout the territory: isolated, inserted into a farm or an urban centre.

The materials that characterized Lomellina's rural architecture were bricks made from local clay (used for walls, floors and roofs) and timber, almost always obtained from the rows of trees separating the plots of land, which also provided wood for current needs of the farms; rare the use of stone slabs, limited almost exclusively to stairs and to the protection of parts of the mills directly exposed to water;

unusual (and restricted to areas close to the course of the rivers) was the use in the walls of pebbles alternating with courses of bricks.

In the 20th century Lomellina's economy retained a marked agricultural character, with few manufacturing settlements in proximity of the major centres (well known is the industrial district of footwear in Vigevano). Agricultural mechanization, however, has partially modified the landscape, expanding the size of the plots and forcing the cutting of most of the rows that subdivided them, who changed form fundamental source of timber and firewood, to simple hindrance to agriculture; however, at the same time the poplar cultivation spread in special plots showing the characteristic pattern with aligned rows.

The Lomellina rural landscape is preciously preserved thanks to the high profitability of cultivations, which favoured the permanence (albeit with the above changes) of agricultural activity and has been a disincentive for conversion of the lands to other uses. The conservation of this landscape is, however, currently at serious risk due to a large public work, unwelcome to local people and imposed from above: a highway that would cut Lomellina from east to west to connect two small towns (Broni - 9'500 inhabitants; Mortara - 15'500 inhabitants), running alongside the existing road and developing almost parallel to two other highway routes, the A4 Turin-Milan and the A1 Milan-Naples (approximately 30 km north), and the A21 Turin-Piacenza-Brescia (about 30 km south).

Fig. 1: Map of the Lomellina and of the neighbouring territories in the 3rd century B.C. (drafted by Siro Severino Capsoni in the 18th century [16]) at the time of the Battle of Ticinus between the Carthaginian and Roman armies. We clearly recognize the Po (which bisects the map horizontally) and the Ticino River, the city of Pavia, and – at the bottom of the map – the hills and valleys of the Oltrepò Pavese.

Fig. 2-3: The countryside of Lomellina (photographs by Emanuele Zamperini, 2012). On the left: a flooded paddy field with a courtyard farm in the background. On the right: hydraulic artefact of the second half of the nineteenth century for deriving water from a channel.

2.2 Historical architecture in the rural territory of the *Piacenza* hills

The Piacentine valleys are characterized by strong altitude gaps and by a marked anisotropy; the river's course and the routes on valley floors, hillsides and ridges are the main travel direction of the territory.

Over the centuries, the Apennines chain has always been a barrier to the connections between opposite sides. The most important directions followed the valley bottoms, but the crossing of the watersheds had obligated the roads to conform to their morphology. In the past, «minor **entrenchment** (arroccamento minore)» roads had been given rise by the presence of settlements, which were located in not easily accessible places for safety problems [17].

In Roman times, the Apennine valleys had already held an economy bound to pastoralism and agrarian production. In the early Middle Ages, following the fall of the Roman Empire, we witnessed a process of heavy decline of commerce and of agricultural activity of the plain's territories, with the resulting abandonment of the Romans roads. Failing the plain's towns, the society found itself downsized a semi-natural economy, recovering the ancient rural villas as places of local life organization. Village communities were developed according to cohabitation rules, that were based on the communal exploitation of the territory. The ruralisation process continued in the Lombard period (VI-VIII century; the old system of communication routes was supplanted by new road network, which facilitated high ground localities. The Piacentine Apennine valleys acquired particular importance as connection routes between Pavia – capital of the Lombard kingdom – and territories of Liguria and areas of central and southern Italy. The importance of these ways grew further due to the gradual spread of religious pilgrimages to Rome and the Holy Land. *Hospitales*, agricultural settlements, villages with the aim to travellers' stop or to defence the territory,

Through the organization work led by the St. Columban monks of Bobbio, the territory was divided into territorial units (*celle*), where there were a place of worship, a farm or a livestock, and, in some of them, a free hospice for wayfarers. Testimony of this territorial subdivision remained in subsequent periods, with the feudal organization promoted in the Carolingian era and with the birth of the communes [18].

With the occupation of the *La Cisa* pass – initially in Byzantine territory – and the rebirth of the plain's economy, the crossing ways trough the Piacentine Apennine valleys gradually lost some of their importance; the final areas of the valleys were affected by more cultural and mercantile changes with the plain and they had a more dynamic and in progressive transformation economy; on the contrary the mountain territories and the more central areas of valleys were characterized by greater static nature of the economic systems, which had conserved Medieval type organizations and territorial management for a long time.

In mountain territories, isolated houses were rare and villages evaded the valley floors, less sunlit and mainly humid, opting for placing along the hillsides, on spurs or level grounds; in the hills, at lower altitude, settlements were situated on ridges, visually communicating among themselves, but there were also some cases of villages which rose along banks of streams whose beds formed real natural ways (fig. 4). The economy was agrarian and self-support, based on horticultural farming, on small cereals fields, or on viticulture (which is particularly important in the low *Tidone* valley), and supplemented by harvest of chestnuts in wooded areas or of juniper berries in uncultivated plots in mountain territories [15].

Fig. 4: Detail with the Val Chiarone of the map of 1713, which represents the feud of Count Giromonte dal Verme. One of the largest centers was Pianello, which was located downstream along the Tidone creek, near the confluence with the Chiarone; Pianello was a reference point for the neighbouring villages because of in the past it had a particularly important market. Along the course of Chiarone, there were settlements and rural hamlets. The current road that connects Pianello to these localities cut the hills slopes, but the original road was adjacent to the creek. The represented villages in the map have already been. State Archive of Parma, “*Confini*”, busta LL, filza II, vol. 3°, doc. 4.

Starting from the nineteenth century, the long decline of valley's economy led to the agrarian decrease and to the disappearing of traditional activities, as herding. The increasingly unpopulated mountain met the abandonment of many settlements and the advancement of woods, which have reoccupied plots, before that, cultivated or intended to pastures.

The northern Apennines mountain territory has conserved yet charm and features of places where human presence has not completely transformed the natural landscape peculiarities [17].

The building typologies of rural areas are related to territory and uses. In mountain, as in *Trebbia* valley territory, the traditional buildings are connoted by stone masonry, roofing made of limestone slabs – called *ciappe* – and floors with wooden beams and planks (Fig. 5-6). Indeed, stone and wood were easily available materials in the territory. The masonry was characterized by visible regular stonework made of partially worked ashlar, thin joints and mortar that doesn't appear in facings [18]. The ground floors housed stables and services rooms and the real dwelling was at the upper floors (one or two); this arrangement allowed to create better indoor environmental conditions of the residence, which was placed between the ground floor, often warmed by the presence of animals, and attics. The stone entrance stair were outside and the internal vertical connections were wooden ladders. The *Estimi Rurali Farnesiani* (XVI-XVII century), a kind of land register of rural properties decreed by the Farnese, Lords of Piacenza, relate information about surveyed buildings which has still been found in rural historical buildings (stone roofing, stone masonry, ovens, etc.).

At lower altitudes, on hills, the building materials are again stone and wood, but bricks appear more frequently and roofing is made of clay tiles, because of the proximity to the plain areas, where the clay were extracted in order to produce bricks. In these territories the stone masonry was made of irregular blocks and, traditionally, it was plastered (fig. 7-8). Also in this case, documents of the *Estimi Rurali Farnesiani* give us some useful information about the rural buildings. The buildings were characterized by stone masonry and clay tiles roofing. Most of houses were one or two floor buildings and they had sometimes an attic or a basement, which was used as tools or agricultural products storage; the stairs could be external or internal.

The stable was placed next to one of the house's walls and over it, there was usually the hayloft, which sometimes had straw roofing; many buildings had cobble farmyards for grain drying and beating. Other typical buildings were porch, oven, dovecote, wine press and chicken coop. There were also other rustic constructions, isolated or adjacent to houses – probably huts or temporary shelters –, which had wooden structure and roofing made of straw or of sorghum bundles, now missing by now [19]. Along the streams there were also many mills.

3. The rural territory valorisation

Only a careful knowledge of the specific peculiarities of the territories is able to allow a rational identification of the most adequate strategies for valorisation of the territory. Indeed, as we have seen, the knowledge and rediscovery of many “minor” heritage buildings and their preservation are indispensable conditions for rural areas’ promotion, which are inseparable from them.

It is therefore essential to define intended uses which are compatible with rural architectural heritage preservation, and don’t involve its deep transformation, but, at the same, are able to promote an economically sustainable utilization of the heritage itself. In fact economic sustainability is a necessary prerequisite in order to manage, to maintain and to enjoy heritage over time; a limit of use that considers unprofitable activities may lead to abandonment and loss.

In the first instance, it would be preferable to preserve the agricultural use, which could safeguard the strong relation between building and territory. However, this isn’t often possible, due to the end of rural activities or the changing of agricultural organization (different size of the area cultivated by the single

farm, changes of machinery and consequently of required spaces, new hygienic and sanity standards for breeding farms, etc.), which would require an architectural distortion.

Key question is the promotion of an integrated conservation of material and functional issues, together with social ones; in order to achieve this goal, it is necessary to start from the popularization of the awareness that rural built and landscape asset is a prime importance heritage [20].

In any way, the imposition of a compatible use should be made along with control and limits imposed by local administrations and it should be compensated by actions which don't demand a direct economic outlay by the same administrations: grants or tax relief in case of rehabilitation or preservation plans, or concessions to build additional volumes (typologically and morphologically compatible with the existing buildings) notwithstanding the current urban regulations.

The tourist valorisation of rural territories can't be based exclusively on the attraction offered by the "emergent" built heritage. In territories where this is scarce, it can attract only a quick getaway tourism, as "half a day" trips; to focus the attention solely on the "emergent" monuments leads tourists to follow a series of "canonical" and always identical routes, and it drives to neglect the territorial dimension of the local culture, overlooking large areas of the territory.

The territorial promotion must be based on a slower pace tourist fruition, and suggest itineraries in which the interest isn't limited only to one destination or a series of stages, but it is extended through the route, consisting of a "diffused museum" (rural and fortified buildings, hydraulic structures, anthropized territory), which we feel «as a mosaic of synchronic coexistence, and concurrently as a diachronic layered palimpsest» [9].

With regard to strongly anisotropic and unidirectional valley territories – such as the Piacentine Apennine valleys – the valorisation could still be based on the "classic" system of an itinerary that notch up a series of consecutive steps, but expanding the view to the whole surrounding landscape. On the contrary, the Lomellina is a flat and substantially isotropic territory, which is constituted by a multistratified palimpsest of various levels of interpretation (irrigation system, system of the mills, system of farms, agricultural landscape, historical medieval testimonies, etc.), and is characterized by many minor elements, whose relevant interest is originated by their systematization; therefore the modalities of its promotion must be different and must allow the overview of a little part of the territory or a thematic interpretation of larger areas.

The system that we consider to be useful in both cases – and indispensable in the second one – is the creation of a web portal, managed by a consortium for territorial development, in which the material and immaterial cultural resources of the territory are stored and geo-referenced with a GIS-based system, and which permits a quick interface with other provided resources of the web 2.0 (e.g. images from Panoramio, Wikimedia commons, etc.). This portal should allow the realization of a personal travel guide, that could be consulted online or downloaded as an e-books (and easily upgradeable or adjustable in case of change of plan with the access to the portal by a smartphone), concerning routes designed according to available time, adopted means of transport, specific knowledge interests.

4. Conclusions

The rural architecture arises from needs of territorial management and it is in close connection with the territory; its material, typological, morphological and social features depend on a long history of agrarian use of territory and they can't be separated from it. In recent decades, the socio-economic transformations have led to the gradual moving away of population from rural buildings and their context. On one hand this caused their abandonment or manipulations, on other hand a widespread need for revival.

The valorisation of rural territories should be based on the promotion of this need for rediscovery and on a process of preservation and of compatible reuse of agricultural built artefacts.

In today's society, the tourist activities are more strongly related to the use of electronic tools and web 2.0, therefore the key issue of the valorisation is considered the implementation of territorial knowledge instruments, that are highly interactive and customizable as, for example, a territorial web portal in which useful data are stored and by which a personalized tourist guide could be created on the base of needs (available time, means of transport, etc.) and of user's interests.

In order to engender the valorisation of the territory, public initiatives are essential to fund and promote this kind of system: consistent with the type of access to the mentioned territories, able to support tourist activities without distorting the territory, and capable of generating more important "income multipliers" than large public works [21].

Peripheral Porosity: Cultural Landscapes of Indigenous Heritage Conservation

Hannah Hunt MOELLER¹

Hannahmo@umich.edu

Abstract

In 2007, the United Nations instated the Declaration of Rights for Indigenous Peoples, promoting an agenda of human rights. However, postulating the 'indigenous' evokes preservationist tactics, meriting value through classification and boundaries. Textual and spatial definitions assert control. This paper examines the foregrounded spatial divisions demarcated by the Declaration, questioning the ostensibly generous provisions that may inhibit, not enrich, the conservation of indigenous cultural heritage.

The paper examines Bolivian legislation issued in direct response to the United Nations Declaration, asserting indigenous autonomy evoking distinctly rural spatial demarcations. This notably avoids predominant indigenous population living on periphery of urban centers as result of post-colonial migration. The paper posits that the ambiguous peri-urbanity is a 'border' as sociologist Richard Sennett explains as 'at once resistant and porous.' The paper argues that the level of porosity of peripheral settlements is essential for a dynamic cultural landscape; at once maintaining heritage ties to indigenous lands while engaging the urban center's labor force.

This paper examines the definitions implicated by the Declaration. It analyzes definitions of people and space, and the subsequent lack of definition for social or spatial ambiguity 'between the lines' of these definitions. The paper acknowledges the ambiguous territory that resists definition and the beneficial affordances of undefined land. To end, the paper argues for new strategies to maintain and nurture cultural heritage. It distinguishes tactics of conservation from those of preservation strategies. Beyond a semantic difference, conservation engages sustained practices of indigenous cultural heritage amidst a dynamic urban ecology.

Keywords: United Nations Declaration on the Rights of Indigenous Peoples, Bolivia, Land Rights, Heritage Conservation, Peri-urban

1. Definitions

Article 26, *United Nations Declaration on the Rights of Indigenous Peoples*

1. *Indigenous peoples have the right to the lands, territories and resources which they have traditionally owned, occupied or otherwise used or acquired.*

2. *Indigenous peoples have the right to own, use, develop and control the lands, territories and resources that they possess by reason of traditional ownership or other traditional occupation or use, as well as those which they have otherwise acquired.*

3. *States shall give legal recognition and protection to these lands, territories and resources. Such recognition shall be conducted with due respect to the customs, traditions and land tenure systems of the indigenous peoples concerned.* [1]

In 2007, the United Nations instated the Declaration on the Rights of Indigenous Peoples, promoting rights to self-determined autonomy and control over cultural heritage. Twenty-two years of long

deliberation and debate between nations and indigenous communities ultimately produced the Declaration celebrated as 'a living document for the common future of humanity'. [2] While the Declaration is not legally binding, it establishes a standard for the treatment of indigenous peoples worldwide. This paper critically examines the spatial and social divisions demarcated by the Declaration, problematizing the ostensibly generous provisions that may hinder conservation of indigenous cultural heritage.

The rhetoric of a moralized 'common future' resists critique and opposition to any of the articles is deemed discriminatory. However, at the risk and defiance of this critique, the following paper seeks to evaluate the 'commonness' of the Declaration as a means to evaluate best practices by which to achieve this 'common future'. This paper argues that the territorial and textual demarcations of indigenous evoke preservationist tactics, meriting value through classification and boundaries. Ultimately, the paper problematizes notions of *preservation* and presents instead *conservation* as a generative strategy that maintains connection to heritage whilst acknowledging dynamic socio-cultural processes.

Fig. 1: Indigenous Aymara Celebrate the Winter Solstice with Offerings of Llama Fetuses in Tiwanaku

The Declaration's rhetoric acknowledges the presumptive minority status of indigenous peoples. Thus, the implications are particularly potent in the South American country of Bolivia, which boasts a 62% population majority of indigenous peoples. [3] Defining spatial demarcations are preliminary steps to determining land rights and seeking self-governance. Beginning with ancestral territory presumes continuity of inhabitation both traditionally and contemporaneously, lacking acknowledgement of either migration or nomadic cultures. Foregrounding traditional spatial occupation is problematic as it renders space stagnant and impedes the dynamic socio-spatial development of cultural heritage.

1.1 Defining People

Remarkably, the United Nations' Declaration of Indigenous Rights lacks a formal definition of indigenous in its dossier of affirmative declarations. This perceived oversight received adamant critique from opposed nations in the General Assembly. Textual formulations of identity resist definition as it narrows identity to legal categories and preconceived criteria. Determining indigeness is thus relegated to self-identification and 'buttressed by an ethos of self-determination'. [4] However, a proximate pamphlet targeted at 'indigenous adolescents' articulated the foregrounded concerns for such definition:

Indigenous peoples are descendants of the original people or occupants of lands before these lands were taken over or conquered by others. Many indigenous peoples have maintained their traditional cultures and identities (e.g., way of dressing, language and the cultivation of land). Therefore they have a strong and deep connection with their ancestral territories, cultures and identities. [5]

Foregrounding the spatial claims create a direct link from land to culture. Ownership of territory is deemed central and the essential quality to distinguish a cultural identity. Nowhere more significant are indigenous land rights than the South American country of Bolivia. In 2005 the country elected its first self-proclaimed indigenous president, Mr. Evo Morales. His presidential inauguration by Aymara priests at the ceremonial site of Tiwanaku set a tone for his political promotion of indigenous rights. [6] In 2009, Bolivia implemented a new constitution that espoused the UN Declaration into formalized legislation as a means to grant greater self-determination to its indigenous peoples. Mr. Morales spoke to his country: "We are the first country to turn this declaration into a law and that is important, brothers and sisters. We recognize and salute the work of our representatives. But if we were to remember the indigenous fight clearly, many of us who are sensitive would end up crying in remembering the discrimination, the scorn." The following year, the Autonomy and Decentralization Framework Law introduced procedures for indigenous communities to establish autonomy, as a form of self-governance and recognition of self-determination.

Mr. Morales' citation of the 'indigenous fight' reflects the atrocities against native peoples by non-native imposters. Spanish conquistadors entered the region in the mid sixteenth century, extracting silver and exploiting the Incan empire. More present in national memory are neoliberal policies of the early 1990's, alluring multinational corporations exploitative concessions for resource extraction. Those who came drew new boundaries and claimed spatial control to assert authority. The responsive legislation rhetoric of Mr. Morales's new constitution attempts to decentralize control, declaring a plurinational state. The goal to re-establish indigenous autonomy through the Autonomy Decentralization Framework Law begins with reclamation of traditional indigenous territory. The Framework Law attempts to reverse the travesties by facilitating indigenous self-determined autonomy. Recognition of autonomy accompanies the textual declaration, affirming ownership, usage, and control as means to manage cultural heritage of native lands. However, seeking to re-establish indigenous autonomy through recognition of traditional spatial occupation is problematic, as ethnic communities no longer inhabit native territories, live nomadic livelihoods, or have migrated to new regions.

1.2 Defining Space

Arguably the most contested articles in the UN Declaration on the Rights of Indigenous Peoples consider the space inhabited by indigenous peoples. As mentioned in the epigraph, Article 26 gives rights to traditional territory 'possessed by reason of traditional ownership or other traditional occupation or use, as well as those which they have otherwise acquired'. [7] During the United Nations General Assembly deliberations regarding the Declaration, four nations vetoed the declaration in contestation of Article 26. Australia, Canada, New Zealand and the United States lamenting problematic assumptions of land rights. While internal national politics certainly played a role, the Declaration defines space only in pre-colonial terms, rendering space stagnant. Primary concerns against the policy argued that the article might supersede national legislation allocating territorial rights to native peoples.

Fig. 2: Crosswalk guards in zebra suits embody urban processes of appropriate city street behavior

The indigenous lands are customarily located in rural regions. In practice, this presents spatially dichotomous categories of rural and urban. Increase in rural to urban migration has raised awareness of fear of losing essential cultural heritage of the indigenous. Upon moving to urban areas, assumptions hold that traditional dress, religion, language, and customs fade in mere generations. One extreme example of the drama of extremity is a contemporary practice to urbanize new rural migrants to city life. One customary scene is of costumed crosswalk guards donning zebra suits to alert both pedestrians and motorists of the white stripes notifying where to walk. The costumes provide a visual pun, as “cebras” signifies both zebra and crosswalk. Though humorous, the intent is to civilize outsiders to engage the city on urban only city’s terms. The space of the city is seen as one in which new migrants not only occupy but gain new urban behavior.

This example posits an exceptional socio-spatial dynamic. Henri Lefebvre reminds us that space is a social product. He argues that space is not limited to a priori Cartesian geographic coordinates, but generated. Space is co-created socially and spatially. [8] This understanding of space is produced and continually *being* produced. The practices of the cebras exemplify this social conditioning of urban space. In this way, the urban space in Bolivia is understood to be where traditions of past are shed for ostensibly modern ways of living. Within this dichotomy, extreme examples of pre-colonial or urban living locate indigenous space in rural regions and the city as the locus of modern life. This distinction is limiting to both people and space operating outside distinct categories between the lines of definition.

2. Between the Lines

For Bolivia’s indigenous, spatial occupation is continually in flux. While the majority of Bolivian indigenous peoples live in rural highlands, many are located here as result of migration post-colonial occupation. In lowland rural areas, however, the 2009 Constitution provided frameworks for state designation of Original Peasant Indigenous Territory, defined as “ancestral territory where common lands or community of origin was constituted”. [9] However, much of the land is fragmented, privatized or shares ownership with national parks. The lack of cohesive territory does little to solidify collective cultural identity.

The final zone of inhabitation for Bolivia’s indigenous resists definition either rural or urban. Deemed the peri-urban, peripheral settlements surrounding urban centers lack discrete definition. The ambiguity of both ruralized urban and urbanized rural provide certain affordances lacking in spatially demarcated zones. As rural to urban migration escalates, this is increasingly the site of Bolivia’s indigenous. Often living in informal settlements and makeshift housing arrangements, this geography affords no legal benefits toward recognized autonomy. However, I argue, that the ways in which migrants inhabit this ambiguous territory provide opportunity for grassroots self-designation and self-identification. The informality instead enables residents to formalize their territory through dynamic socio-spatial occupation.

Fig. 3: Overlooking peri-urban Comunidad Maria Auxiliadora along the southern fringe of Cochabamba

3. Self Definition

Urban edge conditions are precisely the ambiguous territory ripe for negotiating the categorically indigenous rural and urban modern. Sociologist Richard Sennett distinguishes such urban fringes to biological phenomena akin to a cell membrane. The peri-urban enables a spatial porosity, "at once resistant and porous." [10] Linkages between rural and urban maintain a space complicating the rural/urban dichotomy. It is a transitional zone and a landscape continuum. It lacks formalized definition or uniform construction, instead situated as a 'both/and' between dichotomies of rural and urban or indigenous and modern. "The peri-urban interface is characterized by strong urban influences, easy access to markets, services". [11] Regardless, it is distinctly not urban. Living on the edges of urban centers allows indigenous peoples access to the economic incentives of a city. Desirable amenities include commercial markets and an expanding labor force as well as access to the municipal infrastructural amenities such as water, electricity, and transportation. Yet, cultural ties to rural communities remain significant. Members return to help family farms herd llamas or participate in community councils. These urban edges become permeable borders between cosmopolitan living and indigenous lifestyles.

This study of peripheral settlements in the agrarian valley region of Cochabamba demonstrates one example of the sustained practices of indigenous cultural heritage amidst a dynamic urban environment. The community of Maria Auxiliadora is located in the southern zone of the city of Cochabamba. Though its location within the vague peri-urban landscape may render it normative, the community is an anomaly. The community Maria Auxiliadora formed in 1999, after a group of six women purchased the 16.8 hectares of land to establish the community as a communal land trust. The community earned a World Habitat Award in 2008 for its exceptional model of self-initiated democratic governance and collective ownership. [12] It is in fact the informal qualities of peri-urban area that allow residents to establish collective systems of governance, resource management, and cultural production.

Invoking Lefebvre once again, in this ambiguous territory indigenous cultures produce new social space. In its formation, a team of women collectively purchased the territory on the fringe of Cochabamba. In a country where masculine machismo is a cultural norm, the self-initiative of these women is notable. The community foregrounded gender equality as a way to establish new modes of operating. Additionally, the contemporary occupants have emigrated from multiple regions and do not share the same ethnicity. The community chose to purchase this territory outside of the urban center. The implications are a formalization of informal territory and an affirmation of establishing new spatial practices that meld between indigenous and modern ways of living. This example showcases a moment in which a transitory space is defined by grassroots momentum, not by bureaucratic top down spatial control.

4. Redefinition

The motivation of this argument is to present a critical read of the United Nations Declaration on the Rights of Indigenous Peoples with specificity to the case of Bolivia. The implications position anew the stakes of heritage preservation with an eye toward the socio-spatial. The field of preservation has an affinity for borders. This manifests most commonly in historic building zones of city districts, where it is the restrictive codes that give most value to sites through constriction. Meaning is added through the sites' separation to its surrounding context. The cordoning off of space preserves through spatial division. Boundary-making is the present mode of operation for preservationists. Similar tactics are at play in the United Nations Declaration of Indigenous Rights. Defining indigenous through spatial demarcations positions these peoples into categories of indigenous rural or modern urban. Yet the reality of the dynamism between space and culture results in ambiguous territory.

In the case of Bolivia, the presidential regime of Mr. Evo Morales is ironically using similar tactics of definition to maintain control. Ability to self-govern decentralizes control. As such, critics of Evo Morales have been weary of the ostensibly generous proclamations for indigenous autonomy. Divisions of groups via textual divisions ultimately give control to the one drawing the lines. An outstanding 62 % of the population self-identify as indigenous, however closer examination of statistics reveals few purely indigenous peoples is to be found in the country. The 2012 census raised outrage as census forms lacked 'mixed-race' status. The ethnicity of "mestizo" seemed blaringly lacking and ballots instead required citizens to select one of forty ethnic groups. Graffiti proliferated throughout the capital city of La Paz with the words "I'm not Aymara. I'm not Quechua. I'm mestizo," [13] Speculation held that allowing mixed-race status would destabilize and delegitimize the vocally indigenous government of Evo Morales. The aim to create a plurinational state of Bolivia via granting indigenous autonomy appears a preservationist tactic to assert control through classification. Equally, autonomy asserts boundary and isolation. Sociologist Richard Sennett invokes biological references to

explain, 'the border is the limit, a territory beyond with a particular species do not stray' and 'like a cell wall serves as a contained to hold things in'. [14] Strict definition making asserts sectarianism, providing a leverage point for governmentality. These definitions occur both in text and space.

5. Conclusion

It is the very lack of defined spatial boundaries of the peri-urban space that enables self-determination. This paper argues accordingly for another strategy to engage indigenous heritage than preservation. I propose conservation. The discrepancy is beyond semantics. While preservation tactics assert control via top-down boundary making, conservation cultivates. Conservation is dangerous and certainly less controlled. It cultivates choice and self-determination. It enables culture to evolve and enter the urban ecology without prescribed outcomes. While the spirit of the Declaration is apparent to increase human rights for as "a living document for a common future" this "future" must be carefully scrutinized for its utmost potential. The heavy claim makes broad strokes regarding cultural definitions, perhaps missing localized nuances that render the Declaration improbable. The case of Bolivia enlarges an understanding of direct implications that result in spatial demarcations and assumptions unequivocal to empirical realities. The "living document" for global standards must re-evaluate preservationist practices to acknowledge the ambiguous definitions and demarcations of peoples and space. Recognition of cultural heritage must not limit to stagnant spatial criteria but look forward to notions of socio-spatial heritage as both dynamic and living.

The End of Urban Exploitation and the Rise of the Urban Imaginary: Histories and Futures of Detroit, Michigan

William MARTIN

Abstract

Top-down urban development projects often perpetuate sociospatial injustice by focusing renewal in areas occupied by a region's most disenfranchised populations, most commonly urban minorities. Because these populations often lack sufficient political and economic power, they are left with little opportunity to democratically or otherwise oppose the impositions of the dominant urban regime. Legacy forms of urban development through public-private partnership fail to provide an equitable distribution of rights to imagine alternative urban futures even when lead by the most socially radical planners.[1] Such development is conversely complicit in ensuring and facilitating capitalist exploitation of city land. In this paper I will trace the multiple forms of this exploitation before exploring projective strategies for establishing a new urban imaginary as a productive alternatives to the existing paradigm. There exists an extensive body of analytical and critical literature concerning spatial issues of urban injustice and inequality through the lens of Marxist critique, geography, urban planning, architecture, and public policy. This literature focuses on cities as spaces of conflict. This work suggests the potential of interactive media practices to instrumentalized as a means of innovating operative spatial strategies that could enfranchise populations with capacities for self-directed planning that exist outside of both the reactionary activist paradigms of resistance and revolution, whose tools are outmoded. This argument is intended to present one of many potential modes that the paper hopes to inspire. In the first half of the paper, taking Detroit, MI as a paradigm case in a global context, I will trace historic hegemonic regimes of urban development through three phases that dominated Detroit's urban imaginary: (1) federal funded creative destruction (1949-1969), (2) globalization and entrepreneurial governance (1970-1989), (3) postmodern monopoly rents (1990-present). This history will reveal how the imposition of top-down urban imaginaries resulted in the exploitative and spatially unjust environment of Post-World War II Detroit. In the second half of the paper I will begin to theorize the potential of new forms for mediated *spatial* practices to empower disenfranchised urban populations with the capacity to lay claim to a more equitable future through the production of a radically new urban imaginary.

Keywords: Detroit, New Media, Justice, Identity, Conservation

Introduction

Top-down urban development projects often perpetuate sociospatial injustice by focusing renewal in areas occupied by a region's most disenfranchised populations, most commonly urban minorities. Because these populations often lack sufficient political and economic power, they are left with little opportunity to democratically or otherwise oppose the impositions of the dominant urban regime. Legacy forms of urban development through public-private partnership fail to provide an equitable distribution of rights to imagine alternative urban futures even when lead by the most socially radical planners.[2] Such development is conversely complicit in ensuring and facilitating capitalist

exploitation of city land. In this paper I will trace the multiple forms of this exploitation before exploring projective strategies for establishing a new urban imaginary as a productive alternative to the existing paradigm. There exists an extensive body of analytical and critical literature concerning spatial issues of urban injustice and inequality through the lens of Marxist critique, geography, urban planning, architecture, and public policy. This literature focuses on cities as spaces of conflict. This work suggests the potential of interactive media practices to be instrumentalized as a means of innovating operative spatial strategies that could enfranchise populations with capacities for self-directed planning that exist outside of both the reactionary activist paradigms of resistance and revolution, whose tools are outmoded. This argument is intended to present one of many potential modes that the paper hopes to inspire. In the first half of the paper, taking Detroit, MI as a paradigm case in a global context, I will trace historic hegemonic regimes of urban development through three phases that dominated Detroit's urban imaginary: (1) federal funded creative destruction (1949-1969), (2) globalization and entrepreneurial governance (1970-1989), (3) postmodern monopoly rents (1990-present). This history will reveal how the imposition of top-down urban imaginaries resulted in the exploitative and spatially unjust environment of Post-World War II Detroit. In the second half of the paper I will begin to theorize the potential of new forms for mediated *spatial* practices to empower disenfranchised urban populations with the capacity to lay claim to a more equitable future through the production of a radically new urban imaginary.

(1) Federal funded creative destruction (1949-1969),

In 1942 one of Detroit's more powerful companies Homer Warren & Company submitted a "scientific" report diagnosing and prescribing suggested remedies for Detroit's urban issues to the Urban Land Institute (ULI).[3] At the time the ULI had recently established itself as an advocacy organization that would provide outlines for legislative reform for dealing with issues related to the decentralization of American cities.[4] In the report Carl S. Wells, the president of Homer Warren & Company, diagnosed blight as a primary contributor to Detroit's urban issues and identified specific blighted territories on the map as locations.[5] According to the report: "The outward movement of upper and middleclass income groups has been largely due to the fact that the area, approximately 3 miles in radius, which is adjacent the central business district, has become blighted and extremely undesirable for residential purpose;" the report claims in a scientific manner that age and obsolescence are to blame, quoting that "about two-thirds of the structures are close to 40 years old, and the remaining ones are 30 years old." [6] These locations, it was argued, should be reclaimed "for the protection and conservation of those areas threatened by the spread of blight" through "slum clearance, elimination of substandard housing, and location of housing development and redevelopments, under the Urban Redevelopment Corporation law." [7] Almost all of the neighborhoods designated "blighted" were majority black. The manipulated stories and ulterior motives under the guise of technical analysis became the justification of the use eminent domain to displace large minority populations for the purpose of "urban renewal." The largest and most egregious case is that of Paradise Valley, which was the jazz Mecca of the 1940s and 50s and social hub of the black community, with over 300 black owned businesses was demolished. The intent was clear—the business interests of Detroit were explicitly lobbying for the power to clear slums to create space for more lucrative real-estate investment that would encourage the return of the white upper and middle classes that had fled to the suburbs.

Initially this process of "creative destruction" of "blighted" areas entailed a tacit agreement between the state and private interests in with municipal government would take on an expanded role in municipal real-estate market by incurring a portion of the investment risk burden by leveraging federal funds for slum clearance projects. Despite being sold politically as a public good the thrust behind urban renewal in the US became dominated by business interests who manipulated projects to serve exploitative practices that stigmatized and ultimately destroyed predominantly minority and poor urban communities.[8] Subjective biases became instrumentalized as objective science through the construction of a specific urban imaginary. As Weber puts it, "narratives often indistinguishable from the basic empirical identities of buildings, neighborhoods, and entire cities (Shields 1991)[9]. Encouraged by business owners, municipalities constructed an imaginary that defined "obsolete" and "blighted" buildings, that empowered them with the capacity to displace undesired communities that resided on valuable urban land near the central business district, land that was considered unsightly as they were inhabited by poor, black communities.[10] This process render the previously occupied urban land "more malleable and [therefore] potentially more valuable to investors".[11] The extent of urban renewal of this type was so substantial that "between 1949 and 1965, one million people, mostly low-income, were evicted in the name of eliminating blight (Hall 1996). The intentional

construction of an urban imaginary by specific actors and agency dominated by the commercial interests of business and real-estate manifested in a dramatic restructuring of the physical space of the city to their particular benefit at the expense of other disenfranchised communities who failed to successfully proposition for an alternative.

(2) Globalization and entrepreneurial governance (1970-1989)

The power to construct the Detroit urban space through imagined futures remained with privileged private business interests. As global markets expanded competition, industry had increasing liberty to elect where it would produce its goods, these interests were agile to reconstruct the urban imaginary to again serve their interest. In this new context municipal government were forced take on an expanded role in municipal real-estate market to guarantee that development and production would actually take place in the municipality. By incurring a portion of the investment risk burden in the form of debt in order, the municipality would benefit through increased tax revenue to be spent on other politically advantageous projects.[12] At least this was the intent. Attempts to compete for increasingly fluid investment capital in the form of real-estate resulted in a form of boosterism that led to the exploitation of urban communities through “excavation of value” in the form of population displacement that rarely succeeded in the procurement of promised returns.[13]

In 1969 when President Richard Nixon declared that the urban development and housing crisis in the US was “over and done with”[14], the Michigan Civil Rights Commission released statistics stating that 90 percent of Michigan non-whites still lived in “urban ghettos.”[15] Regardless of the local reality, the national narrative enabled the federal government to justify eliminating the programs that were financing urban renewal project funding.[16] Changing policy weakened the capacity of business interests to manipulate urban space through the previous regime of urban renewal. As a result these private interests again utilized the construction of new urban imaginary to regain control of spaces of the city's future. By this time global corporations, including Detroit's own General Motors, Ford, and Chrysler (known as “the Big Three”) were increasingly capable of leveraging global networks to maximize profits by exploiting cheap production costs. These preferences became increasingly indifferent to locality. As a result, the city of Detroit found itself increasingly desperate to keep the automobile industry, the backbone of its economy, within the city. Politicians were faced with the contradictory necessity of attracting placeless multinationals (including the Big Three) and the needs of their local constituents. Faced with this dilemma, Detroit engaged in public-private development in order to lure business interests, including local business elite of Detroit's international mega corporations. However because the city was so desperate to retain big business, the bargaining power fell to the corporations who were able to once again demand control of the urban imaginary of the city. As in the post-war period, a small group of rich and powerful individuals organized to script the future space of the city.

In 1970 a small group of Detroit's most powerful corporations created the Detroit Renaissance Inc.. Their intent to vision the future of city is clear in their name, even if the specifics of that intent were different than their publicity would suggest. Guided by its president Henry Ford II, Detroit Renaissance Inc. constructed an image of corporate pride and commitment to Detroit. This public relations and “corporate responsibility” campaign however had serious ambitions to again free large spaces within the city to the flow of global capital through the construction of several massive downtown riverfront developments. The flagship project, the Detroit Renaissance Center, which opened on the river front in 1977 and was intended as a “catalyst for the renewed growth of Detroit,” however, much like the other large projects directed by the Renaissance Inc., became a sink hole for public financing.[17] The corporations manipulated the city to subsidize their private interests by selling an new urban imaginary in which corporations were city patrons who would, with the aid of city funding, make downtown an attractive place for the business that the city so desperately desired. This imaginary however, in reality, operated as a mechanism of exploitation that enabled once again big business interests to make malleable Detroit urban space in order to grow their own private profits.

The successes in downtown corporate headquarters, encouraged public-private development of production facilities as well. On top of corporate head-quarters, the city also took dramatic measures to keep manufacturers in the city. In 1980 the long established Poletown, a large Polish ethnic enclave in Detroit that also had strong Albanian, Yugoslav, Yemeni, Filipino, and Black populations, was razed for the construction of an automotive assembly plant with the financial support of the city.[18] In order to secure the General Motors auto plant, Mayor Coleman Young enticed GM to stay in the city by gifting \$200 million through incentives to the world's largest industrial corporation; the return of this investment was hoped to be three thousand auto industry jobs—that would never come to be [19]. Total demolition for the development project included “sixteen churches, twenty-five

bars and stores, thirty-three warehousing and industrial facilities, two public schools, one hospital, one post-office, six petrol stations, and fifteen hundred homes in the cities ethnic Poletown neighborhood.”[20]

(3) Postmodern Crisis and Future Frameworks (1990-present).

Today the situation of urban exploitation and the control of urban imaginary in Detroit has become much more complex as the extreme economic and financial crisis has unraveled the potential of traditional modes of asserting agency in construction of urban spaces. A report released by the cities emergency financial manager Kevyn Orr, who was appointed by the mayor to gain control of the dire situation, on May 13, 2013 revealed that Detroit has \$162 million cash-flow shortfall for the current fiscal year which lead to borrowing practices that means that the city now has “effectively exhausted its ability to borrow” in the future.[21] With a crippling “debt load of \$9.4 billion in bonds, loans, and other liabilities” much of has compounded from the manipulated spending on big business, as well as “post-retirement liabilities exceeding \$5.7 billion,” it is clear that public private partnerships with the city will no longer be a viable path for business interest to construct urban space to their benefit.[22] The slow nature of this unprecedented economic demise within a shifting cultural and demographic context, Detroit’s majority black population today nearly half what is was in the 1950s when the city was majority white, has enabled new strategies wealthy vested interests to take advantage of the situation in order to manipulate Detroit’s future in their own interests.

The installment of the emergency financial manager by Republican Governor Rich Snyder, a notoriously pro-business politician, enabled the take over of any budgetary and spending decisions the city makes, without the capacity of any of the cities democratically elected officials, including the mayor and the city council to affect decision making. It is likely that privatization of public sector services as well as the sale of public land to private interests will play an strong role Orr’s strategy.[23] Much of the black, democratic, population of the city see the move as a hostile take over of the city by a white, republican state government, who many fear will continue to make concession to big businesses on the back of the working class like anti-union “right to work” legislation passed by the administration in. [24]

Other opportunities for business interests in the contemporary context have been driven by the sever discounting of property in the cities real-estate market which, because of the dramatic disinvestment and abandonment of building in the city. It is estimated that there are around 78,000 abandoned buildings within the city.[25] As a result, owners of mega-corporations that are insulated from the severity of the deep regional recession, have been able to make major real-estate investments at individual private investors because the prices for land and existing buildings are so low. This year, the Illitch family, the family who started the national pizza chain Little Caesars, has announced plans for a \$650 million entertainment district that plans to, amazingly give the financial struggles, take advantage of signification state and local subsidies.[26] A part of the plan is to build a new stadium for the Red Wing hockey team, who the Illitchs own, that integrates several other of the families prized possessions including, the Detroit Tigers baseball team, the Tigers stadium Comerica park, and adjacent Fox Theater which represent a large percentage of downtown real-estate. Another major private player is Dan Gilbert, Detroit’s wealthiest person, owner of Quicken Loans. Operating through his real-estate investment company Rock ventures now owns 14 buildings in Downtown, has recently purchased the Greektown Casino with ambitions to expand his assets downtown into an entertainment district as well[27]. Gilbert met recently with US Secretary of the Interior Ken Salazar in order to secure Federal tax incentives for the development of the buildings that he owns that are historically designated.[28] While many of the cities disenfranchised communities are being evicted or having their homes foreclosed on, the wealthy owners of regionally headquartered mega-corporations are taking ownership of prominent real-estate in the more affluent downtown and midtown areas, which are being prepared as havens of middle and upper class constituencies. This future excludes the majority of the city’s population.

Outside of the agency of ownership, new mechanism for constructing an urban imaginary have emerged in Detroit’s particularly desperate situation including a new form of city planning document for shrinking city. The potential effects of the January release of a planning document called the *Detroit Future City framework(DFC)*. [29] will not be understood for many year to come, however given the deep history of such documents to pander to powerful business interest, the unprecedented nature of the document as one the plans for shrinkage not growth, and it arrival a such a crux moment in Detroit modern history requires that the document be taken seriously as a new paradigm for Detroit’s urban imaginary. Given Detroit’s history of private sector exploitation being empowered by

such documents, many local residents are very skeptical of the potential ramifications of the framework while members of the planning profession and academics have sang in praise of its innovation. An extensive analysis of the document is outside the scope of this paper, but even a surface investigation raises some red flags.

A primary innovation of the 347 page document is the production of a planning document that is not based on growth but on “right sizing”. As Justin Hollander, an urban planning scholar, puts it, “for much of the Western world, the ways that cities typically achieve the kinds of goals identified by the plan has been through growth,” where as the *DFC* “is grounded in a pragmatism based on demographics” that identifies selected areas of growth and “if a place is growing, let’s manage that growth through new infrastructure and coordination of services.”[30] In general, the plan gives a rhetorically coiffed, more politically palatable plan for a spatial control of the cities remaining population through geographically discriminated service provisions, in order to reduce costs attract future investment and development. Less populated areas are primarily designated as “innovative” or “productive” landscapes. When investigates the many potential typologies for such space however, it becomes clear that they operate more as blank slates for technocratic, private industry lead infrastructure development, than publically oriented landscapes.

Despite concessions in the plan to importance of the already existing grass-root service structures that have emerged as the public sector became increasingly unable to provide services, the capital intensity of many of the suggested landscape and infrastructure typologies clearly require massive private investment at potentially high risk. The document provides no financial plan for the project. The unstated financial reality would severely limit the pool of potential business that would benefit from the large scale land use changes proposed by the plan to large, established, outside corporations. While the document claims to “encourage local entrepreneurship and minority business participation” the nature of its dominant spatial restructuring of the city would seem to discourage their potential participation.

Other facts surrounding the inception and production of the *DFC*, specifically concerning the funding of its research, demand that the document be analysed critically as a new and potentially dominant urban imaginary that could ultimately pander to private interests, much like Detroit previous, dominant imaginaries. To start, a large portion of the funding that went into the production of the *DFC* research and production came from the Kresge Foundation, who has also committed \$150 million to seed early projects.[31] However, in the past the foundation has been directly involved in less publically oriented development projects in the city including ambitious and unrealized plans to develop Detroit’s waterfront with Luxury condominiums; a project that failed because of the economic crash in 2008-2009. The foundation, which as a part of their involvement had made initial investments in the waterfront in 2002, doubled it’s the donations in the city of Detroit. [32] Detroit related projects included city infrastructure projects like a \$9.1 million grant in 2008 to establish a public-private partnership M-1 rail line, a mass transit line along Detroit’s main North-south axis Woodward Ave., “anchor institutions.”[33] In 2011 alone they provided \$25.5 million in grants for their “Re-Imagining Detroit framework” with the stated goal of “to change the city of Detroit’s trajectory to one of long-term economic opportunity that advances social equity, promotes cultural expression, and re-establishes our hometown as the center of a vibrant region.”[34]

As a private foundation, The Kresge Foundation is by definition a 501(c)(3) non-profit which makes any explicit private benefit of its operations technically illegal, however at the scale in which the Foundation is operating in Detroit, private benefits, and losses, are inevitable and such ambiguity privileges larger business that have the skills to understand and exploit new imaginary delivered by the document. Even the format of the document, which is extremely long and text heavy, excludes a large portion of the population of which nearly half are considered “functionally illiterate,” according to the National Institute of Literacy.[35] Despite the rhetoric of equity of inclusion and equity purported by the Kresge Foundation and the *DFC* this error in format for the supposed intended audience is a major omission. Even without suggesting any specific exploitative intentions, the explicit and implicit privileging of big business by *DFC* suggests that, if it no alternative or corrective measures are taken, that Detroit’s new urban imaginary will again fail to serve it’s majority population much like the imaginaries the preceded it.

Already projects that are specifically heralded as models within the *DFC* are underway that reveal potentially exploitative nature of such future projects. These projects represent a significantly different type of land acquisition than the more historically traditional forms of concentrated land clearance and public-private development practices. In March, the City Council of Detroit approval the purchase of 170 acres of vacant land to Hanz Woodlands and Farms, a business venture of the Hanz Group, a regional real-estate investment corporation. The president of the Hanz Farms says that the plan is to “make the neighborhood more attractive, more livable and, then, also, by eliminating the

publicly-owned blight, the private property increases in value.”[36] Before the sale was approved Marcel Todd Jr., director of Detroit’s City Planning Commission, said the Hanz deal would be “the largest speculative land sale in the city’s history.”[37] Outside of its scale, what makes Hanz Woodlands and Farms unique and perhaps insidious is that it is corruption of a preexisting practice, native and authentic, to an abandoned city whose aim is individual empowerment and subsumes it into a dependency model. Much of this land and land elsewhere has been attempted to be purchased by local urban farmers who struggle to purchase affordable land from the city. Malik Yakini of the Detroit Black Community Food Security Network are concerned about the long-term power dynamics of the deal: “As we struggle to foster food security, food justice and food sovereignty the question of land, who ‘owns’ it, who controls it, and who benefits from it, must be in the forefront of our discussions.”[38] The Hanz Group, by simultaneously maintaining preexisting practices and employing local labor can maintain local support unique urban condition that will provide the unique value for the real-estate, to be traded at a later date at the cost of the native community who will likely no longer be able to afford to live their or whose homes will likely be under the threat of larger development plans. This process, though related to more traditional form of urban exploitation such as gentrification, it also perhaps signals a new battle ground on which the majority public must reassert its agency in order to take control of its future by defining the dominant urban imaginary to serve its own ambitions in order to guarantee a more equitable future.

Towards a new urban imaginary

The complexity through which the private interests of big business are served by dominating the urban imaginary of Detroit, presents a considerable practical and theoretical challenge in finding potential strategies for empowering the disenfranchised majority population in the city to galvanize a dominant urban imaginary that can overcome the historic oppression of which was layered out in the first half of the paper. I will argue that new forms of media driven spatial practices could provide options for historically exploited populations to develop their own paths towards a future of their own imagination outside of the unending cycle of capitalist exploitation that has defined their norm. While media has many advantages, including its audio/visual format and ease and affordability of its dissemination, it also has been historically a deeply problematic format that played a complicit role in historically exploitative urban imaginaries. Therefore to defend medias viability, I will first construct a theoretic argument for its potential before providing several successful examples of its constructive adoption towards the active production of a new urban imaginary the breaks from the endless cycle of capitalist exploitation in which Detroit is trapped.

A valuable framework for understanding the way the urban imaginaries are operating in today’s context is presented by the geographer David Harvey in his book *Rebel Cities*. He argues that we are entering a period where global capital is now driven to exploit “monopoly rent,” or the technique of corporations who “trade on values of authenticity, locality, history, culture, and action” in order to differentiate their products, so to charge premium prices for their products.[39] In relationship to Detroit, this condition is most obviously and simply observed in the use of the Detroit “brand” demonstrated by the automotive corporations like Chrysler who have cultivated the “exported from Detroit” identity in recent years. Their commercial campaign has focused almost exclusively on the identity of Detroit as a distinguishing factor of the car’s value. This concept could also be extended to the DFC framework that relies on Detroit’s uniquely abandoned quality to position the city a uniquely capable of absorbing innovative private investments. This exploitative condition also provides opportunities for change Harvey argues.

For Harvey the potential for resistance is latent in the contemporary condition of monopoly rent “which is a contradictory form as it seeks the uniqueness that is antithetical to its desire for homogenous commodity, therefore it can support, paradoxically, the transgressive.”[40] His point is that local practices remain critical to the production of monopoly rent value, and therefore must be maintained for their exploitation to endure. His point is that this, albeit reluctant, support of autonomous cultural production could potentially be consolidated into a resistive force. The Kresge Foundation and many other corporately funded grant giving organization, for example, provides generous support to artists and community organizations that could apply their funding towards advancing a more specific, directed, and subversive agenda. In Harvey’s words “by seeking to trade on values of authenticity, locality, history, culture, collective memories, and tradition they open a space for political thought and action within which socialist alternatives can be both devised and pursued.”[41] I suggest that this force should be creative, not resistive. This political thought and action must take new participatory and projective forms as a new urban imaginary.

Luckily new forms of production are democratizing the availability and access to the means of producing potentially productive urban images. Yochai Benkler argues that cultural production using relatively cheap and portable video cameras is an “essential ingredient in structuring how freedom and justice are perceived, conceived, and pursued”[42] Benkler heralds the capacity of the new form: “the practical capacity individual and noncommercial actors have to use and manipulate cultural artifacts today, playfully or critically, far outstrips anything possible in television, film, or recorded music, as the were organized throughout the twentieth century.”[43] Furthermore the new production methods and distribution outlets accompanying the network revolution of digital technology is enabling an unprecedented new form of expression. For Benkler “the networked information economy makes it possible to reshape both the “who” and the “how” of cultural production relative to cultural production in the twentieth century. It adds to the centralized, market oriented production systems, a new framework of radically decentralized individual and cooperative non-market production.”[44] It is perhaps through this radical decentralization that cultural production can occur that is diverse enough that it evades capital exploitation yet directed enough to establish new cultural trajectories and urban imaginaries.

This path must be taken carefully and with serious intention. As Harvey stresses, defining “whose collective memory, whose aesthetics, and whose benefits are to be prioritized” is an essential operation in mobilizing a larger movement. [45] I argue that the “who” in question, does not yet exist, but must be constructed. Passive and reactive forms of identity consolidation that rely solely on place and a primary contributor to association have proven largely ineffective in Detroit, failing to withstand the top down pressures exerted through capitalist controlled narratives of big business. New forms of identity construction are needed to expand collective conceptions of self. Inclusion as opposed to exclusion must be the default policy. The strength of this approach was demonstrated in the Occupy Movement’s association of the 99%. Instead of relying on place restrictive material like heritage, that more commonly looks at maintaining heritage rather than constructing new identities, we must rely on a multiplicitious yet increasingly consolidated counter imaginary, not heritage, to construct the future. Such an approach could expand the reach of interpersonal association to the global scale at which mega-corporations operate and therefore could contend with the dominating exploitative imaginary.

Relying on media to proliferate exposes new imaginaries exposes new narratives to cooption or corruption by opposing interests. Furthermore mediated approaches of constructing urban imaginaries are appealing as they are complicated in the post-modern context. This contemporary reality therefore requires a strong theoretical underpinning to maintain a directed, albeit open, agenda. Today, the radical potential of Michel de Certeau’s “practice of the everyday life,”[46] the production of culture in other words, has been largely consumed by media and subverted by global capital. In this context of the “Culture Industry” theorized by Theodor Adorno. He states “culture, as it is now conceived of, exists because freedom does not.” [47] Adorno, in this way, laments the destructive capacity of media’s complicit relationship to guaranteeing monopoly rent. However, following Harvey, there remains in spite of this lament a potential means of transgression.

Adorno’s apprehension, despite referencing dramatically different technological context, must be seriously considered. For Adorno “cultural production is no longer the repository of a reflective comprehension of the present in terms of a redeemed future; the culture industry forsakes the promise of happiness in the name of the degraded utopia of the present. This is the ironic presentation of the present.”[48] Historically, this condition has been devastating for black urban identity, and its threat persists today in new forms. The rise of “blaxspoitation” films popularized in the 1970s by films such as *Super Fly* (1972) and *The Mack* (1973) had caustic and pervasive effects on the black urban imaginary. The stylish, drug dealer type who lives a life of excitement and violence was sold to black and white audiences alike. These films worked to reinforce stereotypes among white audience while romanticizing the notion of the gangster to economically disadvantaged urban black audiences. Impressionable youth who were left without opportunities took to committing “crimes of necessity” and adopted this romanticized persona believing that violence, drugs, and money were the pinnacle of cool. In the documentary *Detroit-The Murder City* (2011) interviews with men who had been incarcerated for violent crimes in Detroit specifically cited both *Super Fly* and *The Mack* as inspirations to their behavior at the time. This very behavior resulted in long-term prison sentences for many black youth. Here we see the execution of the “controlling movement of postmodernism” according to Adorno, “the collapse of the difference between culture and practical life...”[49] The task of the disseminating transgressive locally produced urban imaginaries therefore must be a process of narration, the consolidation of a projective, local urban imaginary that expands the potential of cultural production into previously unimagined or experienced territory—the production of a new urban imaginary.

The asserting of a new urban imaginary through media must assert the imaginary of the historically disenfranchised as the dominate progenitor of the future, combating the historic submission of this collective voice. According to Madhu Dubey, an African American and Cultural Studies scholar, African Americans in the United States have been historically denied access to the cyber oriented future. [50] The African American experience itself, in other words, has been positioned as being “antithetical to futurist imagination” on the whole, systematically denying African American communities equal access to making projective claims on the future.[51] Dubey quotes Samuel Delany, the African American science fiction writer, who said that “We need images of tomorrow and our people [African Americans] need them more than most” stressing the importance of future image construction and urban agency.[52] As the cultural critic Mark Dery puts it, “the unrealestate of the future is owned by technocrats and set designers who have been white to a man.” [53] Famous futurist “Detroit” films like *RoboCop*(1987), depict Detroit as a dystopic, desolate, crime infested city that buys a private technocratic solution to its urban issues, the salvation of a white, brutal, cyborg police officer. In this case the general case that Dubey describes has particular resonance with the history of Detroit, fictional and real. Therefore there is a double imperative of the internal production and construction of a projective African American urban imaginary.

Conclusion

The term “urban imaginary,” as Andreas Hyssen defines it in his 2008 *Other Cities, Other Worlds: Urban Imaginaries in a Globalizing World*, is “part of any city’s reality rather than only figments of the imagination.[54] Similarly for de Certeau “there is a ‘metaphorical’ city that ‘slips into the clear text of the planned and readable city.’[55] There exist tremendous agency in claiming control of such a metaphor. We see that as Weber warns “States discursively constitute, code, and order the meaning of place through policies and practices that are often advantageous to capital (Beauregard 1993).”[56] The new urban imaginary must discursively constitute, code, and order the meaning of place towards new, spatially and socially just ends.

The production of a new urban imaginary should be participatory and ritualistic. Maya Deren, an important figure in the modern avant-garde of film writes: “The ritualistic form treats the human being not as the source of the dramatic action, but as a somewhat depersonalized element in the dramatic whole. The intent of such depersonalization is not the destruction of the individual; on the contrary, it enlarges him beyond the personal dimension and frees him from the specialization and confines of the personality. He becomes part of dynamic whole which, like all such creative relationships, in turn, endows its parts with a measure of its larger meaning.”[57] This capacity of the ritual when filtered through new distributed forms of media could provide a potent means to engage the production of a new urban imaginary on an expanding scale, from the local to the global.

New formats of producing media, original and remixed, are beginning to provide essential formats for such participation. In this arena, the interactive media platform *Zeega* (www.zeega.com) stands out as having particular promise. *Zeega* was developed by a team of urban theorists, economists, coders, and media producers to “[revolutionize] web publishing and interactive storytelling for a future beyond blogs.” 58] According to their team “ With *Zeega*, you can use any media in the cloud, transform the entire screen into your playground, and share your interactive creations with the world.”[59] This new media format, coined “database documentary” by one of the platform’s authors Jesse Shapins is the subject his PhD work at Harvard University’s Graduate School of Design. Shapin’s argues for the expressive and generative capacity of the database documentary to enable “kaleidoscopic perception” and “sensory estrangement” which empower platform users to construct new urban imaginaries.[60] New formats like *Zeega* could enable the simultaneous production of the expansive diversity of stories, experiences, and ambitions of disenfranchised urban populations to be collected and documented through media, in way that is both consolidating and projective. Through the democratic involvement of many users, a new, emergent urban imaginary could organically develop and be honed through the malleability of collectively produced and curated online materials. By producing original content and remixing appropriated content, adults and children of all ages given minimal training could participate, whether they are literate or not.

In Detroit a platform like *Zeega* could provide a fertile ground on which a new urban imaginary could begin to be constructed. It could also acted as a centralized means of digesting documents like the *DFC* document, which, to its team’s credit, undertook a valuable oral histories video project titled *Detroit Stories* (<http://detroitstoriesproject.com/>). Visuals and stories from the extended *DFC* research and the document itself could be “remixed” through *Zeega* with an already existing and expanding database of content that expresses and celebrates the many perspectives and innovative urban imaginaries that were left out of the *DFC* framework. Content could be created through a mediated

version of the research of urban and architectural scholar Andrew Herscher which catalogues Detroit's extensive alternative urban cultures in his book *The Unreal Estate Guide to Detroit*. [61] Herscher's book "helps us to re-imagine Detroit by showing us the places where Detroit is being re-imagined—the places where new values, politics and solidarities are forming a new city of hope," according to Grace Lee Boggs, lifetime Detroit activist, community leader and author of *The Next American Revolution*. The contents of the DFC document and Herscher's book in the right format could be extremely empowering as material for communities to use to construct a new, alternative urban imaginary that is strong enough to compete with those imposed by the top-down powers of big business. If the content were to be put in an audio visual format, it could then be digested, remixed, and instrumentalized by Detroit's historically disenfranchised communities with the help of a platform like Zeega.

As David Harvey warns, "no alternatives to contemporary forms of globalization will be delivered to us from on high. It will have to come from within multiple local spaces—urban spaces in particular-conjoining into a broader movement." [62] The production of such an alternative, however, can and must start in some place. Given Detroit particularly exploitative history and its contemporary condition in which capitalists are willing to fund cultural production projects, it is well situated to be the epicenter of such a movement. A networked, mediated approach to constructing urban imaginaries would enable Detroit specific knowledge to mix with other urban centers and populations in the US and internationally, expanding the potential of a globally galvanized, positive and projective urban social movement that could dominate the established exploitative regime. This movement, however, necessitates a proper tactical approach and theoretic framework to proceed. This paper has intended to make one step among many toward that end, the end of urban exploitation and the rise of the new urban imaginary.

The San Antonio River: A Rich and Complex Cultural Landscape in Texas

Angela LOMBARDI¹, Sedef DOGANER¹

⁽¹⁾ College of Architecture, The University of Texas at San Antonio, San Antonio, TX USA

sedef.doganer@utsa.edu

angela.lombardi@utsa.edu

Abstract

The city of San Antonio has a rich and unique historic urban landscape: it is characterized by its river and famous Riverwalk where historic neighborhoods and major landmarks such as five 18th century Spanish missions are located.

The Riverwalk was re-shaped in the 1930s' intending to emphasize the city's Spanish heritage, creating a landscape to let the city become the 'Venice of Texas'. Today, a comprehensive, multi-year project is underway to restore and enhance 13 miles of the San Antonio River both north and south of downtown.

In the city's south section, the River Improvement Project, Mission Reach Ecosystem Restoration and Recreation Project, is transforming an eight miles stretch of the San Antonio River into a quality riparian woodland ecosystem, reinforcing the connection to the Missions and encouraging circulation along the river beyond the downtown area.

This is a unique project, which restores river features and riparian woodlands, reintroduces native plants, enhances aquatic habitat, and reconnects cultural and historical features. Mission Portals will re-connect the historic missions to the San Antonio River, will feature historic and artistic interpretations, and will highlight their social and cultural importance to the area.

This paper will discuss how the San Antonio River represents the physical and symbolic link of its rich cultural heritage with not only its landscape and architectural heritage but also with food and traditions. This paper will enhance cultural and environmental sustainability at local and neighborhood levels while giving inhabitants and tourists an option to experience the 'revitalized' cultural heritage of the region.

Keywords: San Antonio River, cultural landscape, restoration ecology, tourism

1 Introduction

Earliest Spanish settlers immediately recognized the wealth of natural resources necessary for establishing a thriving community: the narrow river, although not navigable to the ocean, offered an oasis of sorts on the far northern frontier of New Spain. Creeks, springs, farmland, and a temperate climate all were factors leading to the foundation of a settlement, to be destined to become the ninth largest US City [1].

The city of San Antonio was founded as a presidio in the first quarter of eighteen century, and the five 18th century Spanish missions were built along the San Antonio River. The River and the Spanish colonial resources along its banks have nowadays a strong significance for American citizens, as part of their own legacy, particularly for the people of South Texas [1].

The San Antonio Franciscan Missions cultural landscape is on the U.S. "tentative list" to be advanced as a possible UNESCO World Heritage Site since it can be considered to be one of the best models of the culmination of Spain's design for its mission empire, and it includes five Spanish Colonial mission complexes – Alamo (San Antonio de Valero), Concepcion, San Jose, San Juan Capistrano, and Espada – situated along a 19.3 kilometer section of the San Antonio River basin. The Spanish Crown, however, intended to create self-sustaining, socio-economic units, supporting the establishment of missions as transitory ecclesiastical settlements that would develop into permanent secular communities in defense

of the territory against incursions by other European states [2]. The construction of a network of *acequias* (water ditches), built by the Spaniards since the first half of 18th century, witnesses the high-skilled engineering system for irrigating the land and it is in deep connection with the San Antonio River.

The River South Area is the home of the oldest continuously functioning Spanish colonial dam and acequia. Within the River South Area the oldest priority water rights in the State of Texas originated from mission agricultural use and continue to influence land use in and around the missions [1].

Downtown San Antonio is characterized by its famous 'Riverwalk' and historic neighborhoods. Due to the historic importance of the Riverwalk, together with the Alamo, San Antonio is one of Texas' top tourist cities today. The famed Riverwalk has been an attraction since the 30's. However, beyond the Riverwalk, miles of river remained undeveloped within the city limits, yet deeply altered by interventions which aimed at preventing river floods.

This paper examines the San Antonio River and its transformation throughout its history, including the 1954 Corps of Engineers channelization project, and analyzes the 2001-2014 San Antonio River Improvement Project (SARIP) and Mission Reach Ecosystem Restoration Project by means of its landscape, reconfiguration of the channel, flood management, River's ecology, restoration of the flora, park facilities and infrastructure and historical connections.

This complex ecosystem restoration project aims to recreate, at large spatial scale the features and the natural balance of the historic landscape characterizing this area for centuries involving also complex stakeholder and public roles.

Finally this paper discusses the potentials of tourism in the Mission Reach area, the expansion of the Riverwalk to the south. The River improvement project reinforces the connection to the San Antonio Missions, encouraging visitors to circulate along the river beyond the downtown area.

San Antonio River Improvement Project and the possible World Heritage designation of the San Antonio Missions restores the broken balance of this rich cultural landscape, bringing international attention to the district, accelerating cultural heritage tourism, and providing "high profile catalyst" for even more cultural visitations.

2 San Antonio River and its transformations

The first documented arrival of Spanish explorers at the river occurred at the end of the 1600s: members of a Spanish expedition celebrated Mass on the banks of the river on June 13, 1691, Feast Day of Saint Anthony. During the religious function, Franciscan priest Damien Massanet renamed the waterway 'San Antonio'.

Spanish Missionaries and colonists built acequias, a series of dams and hand-dug ditches which served to bring river water to the missions and to the original civic settlement. They are considered some of the earliest recorded engineered water systems in the nation, shaping the landscape for more than two centuries.

A system of eight acequias related to the San Antonio River is documented since 1718, and was an effective water distribution system for nearly 200 years, allowing the irrigation to surrounding land for farming and pastures for the missions and for civilians. The acequias, together with some creeks and the river, allowed the growth of the urban settlement, providing potable water. The term *acequia* is derived from the Arabic *al-saqiya*, its etymology clearly reveals an Arab origin of this construction technique, which was most probably brought to Spain [3]. Ancient maps and documents, however, identify an artificial water ditch, built prior to the arrival of the Spaniards, constructed by the Amerindians who populated this area.

Since the 1800s, the San Antonio River has experienced flooding problems due to its geographic location, increasing population in the area, and its related infrastructure improvements that lead to increasing rainfall runoff [1]: Spanish records reflect that the flood of 1819 swept through many homes in its path. Other Floods arrived in 1865, 1880, 1899 and 1913; a deadly flood in 1921; a major flood to San Antonio's downtown district in 1946; and the most recent floods of 1998 and 2002 [4]. A 1920 study for the city by the Boston engineers firm of Metcalf and Eddy predicted a devastating flood, like the 1819 one, would occur again [5]. In particular, the 1921 flood sign a turning point in the history of the river. In September 8, 1921 a sudden, hard rainfall over the Olmos Basin and San Antonio River resulted in over 9 feet of water downstream in the center of the city, on Houston Street, causing flooding that killed 50 people and

Fig. 1. Postcard of the 40s' where San Antonio is promoted as the 'Venice of America' [5].

millions of dollars in damages [1].

The San Antonio community made historic and controversial decisions to implement flood control measures: to control future flooding on the San Antonio River and on San Pedro and Alazan creeks, 2.8 millions dollars bond were issued for building a new dam and straighten the streams. Olmos Dam, a concrete wonder 80 feet high and 1,925 feet long was built in 1925, in the downtown historic area, the Great Bend's cut off channel, as wide as the Great Bend itself, was completed in 1930 [5].

The river park had its first permanent Riverwalk in 1928: this first Riverwalk segment covered three city blocks from Houston Street, and around the start of the Great bend, to Navarro Street [5]. The great bend not only kept its trees but gained gates to divert into an alternate channel. The following decades saw continuous improvements to the downtown segment of the River: the development of a more extended Riverwalk were inspired by Robert H.H. Hugman –city architect– who saw San Antonio river as a chance to exploit the city's Spanish heritage with commercial activities and open spaces [6]. He developed an architectural plan aiming at preserving and enhancing the natural beauty of the downtown and river loop area. Descriptions of old cities of Spain, Mediterranean architecture, as well as Xochimilco, Mexico City's water gardens were its inspirations. In 1929, Harlam Bartholomew was hired and he envisioned for the river to maintain a more natural, contemplative linear park through the heart of the busy city. The Depression, however, had plunged downtown San Antonio into a slump from which it would recover in forty years, Hugman's and Bartholomew's plans were only partially realized [5]. Despite the Depression, the city did not abandon the river 'beatification', the Alamo's battle centennial was celebrated, and the celebrations included the first "Venetian Carnival" on the river, along the cut-off channel.

Fig.2. 1941 map showing the Mission Reach segment with relative location of the five Spanish 18th century missions. The map was published in the San Antonio Conservation Society- sponsored WPA guidebook to San Antonio [11].

In 1937 a public office for the protection for the river was created: San Antonio River Canal and Conservancy District, then renamed in 1953, the San Antonio River Authority (SARA). SARA is charged by the state of Texas to preserve, protect and manage the resources and environment of the San Antonio River and its tributaries. The agency's original purpose was to seek development of a barge canal but after floods in September 1946 which costed San Antonio six lives and \$2.1 million in property damage, the district discontinued its navigation studies in favor of flood control efforts [7].

From 1939 through 1941, the pilot channel was deepened, three dams were constructed, underground drains built, and flood gates installed at both ends of the river loop. Aesthetic features included stone walkways and stairwells and graceful footbridges. Also added was an outdoor river bend theatre – the Arneson –, preservation of indigenous trees and plants, and Hugman's northern flood gate, adorned with arches and an arbor that lend an Old World Spanish flair. San Antonio's Riverwalk was born [4].

A second devastating flood in 1946 prompted a comprehensive flood study by the U.S. Army Corps of Engineers completed in 1951. This study recommended the channelization or straightening of 31 miles of the River and its tributaries, the project was known as the San Antonio Channel Improvement Project (SACIP) and authorized by Congress for implementation by the Corps of Engineers in 1954 [1].

SARA acted as the local sponsor of the projects and was responsible for obtaining partial funding and all necessary rights-of-way, as well as for relocating all utilities and constructing all required bridges and in-channel dams.

Although the works undertaken were an effective way of managing flood water, they did not take into consideration Leopold's 'land ethic' which does prevent the alteration, management, and use of natural 'resources,' but it does affirm their right to continued existence in a natural state [8]. Leopold's land ethic is a pivotal point in America's environmental awareness since it asserts that the role of Homo sapiens has to develop from conqueror of the land-community to plain member and citizen of it, respecting for his fellow-members, and also respect for the community as such [9].

The effects of the reconfiguration of the channel of San Antonio River was effective for controlling the water flood, but it altered the traditional land use and, in general, the historic landscape of the area, but had as a result the damage of the ecosystem of the river.

Few years later, in 1961 the legislature enlarged SARA authority's jurisdiction and also expanded the duties/vision of the agency to include, 'new' environmental topics such as conservation and use of ground water, pollution prevention, reforestation, and preservation of ecology [10].

Since 1982, the San Antonio River Authority and the Corps of Engineers began to consider the feasibility of a bypass system to divert flood water through two tunnels to be built under downtown San Antonio, instead of risking uncontrolled flooding along the Paseo del Río. The construction of the tunnel began in 1988. The San Antonio River Tunnel, which was 24 feet 4 inches in diameter three miles in length, was scheduled for completion in 1995 [11].

The first projects focused on the downtown area, not taking into consideration the River South, characterized by a low-density population [1]. A community-based vision for improvements to the River emerged in the last twenty years of the 20th century, and in 2001 the scope of work transitioned from the SACIP flood control focus to the broader San Antonio River Improvements Project (SARIP) which identified "environmental restoration and recreation as project purposes" [10].

A new generation of flood management emerged in local community in 2002 with creation of the Bexar Regional Watershed Management (BRWM), a partnership among SARA, Bexar County, the City of San Antonio, and 20 suburban cities. This partnership allows the development of a community-based vision with a holistic, regional approach to managing flood control, storm water and water quality.

The program establishes uniform design, operation and maintenance standards; coordinate local, state and federal funding; and provide an opportunity to measure and evaluate the quality of services delivered to citizens of Bexar County [7].

3 River Improvement Project and the Mission Reach

The San Antonio River Improvements Project (SARIP) is \$358.3 million on-going investment that targets 13 miles of river banks. The multi-phase project is focusing on improving three sections of the river that pose different challenges: the four-mile Museum Reach north of downtown, the one-mile Eagleland and eight-mile Mission Reach south of downtown [4].

Fig. 3. SARIP is divided in 3 segments: the Museum Reach, the Downtown Reach and the Museum Reach. The planned extension of the riverbank improvements will make the Riverwalk more than six times longer [5]

Specific objectives for the Museum Reach, which is the urban segment of the project, are extending the amenities of the world-famous San Antonio Riverwalk and connecting cultural institutions and commercial centers via a linear park. The linear park, with a newly landscaped river channel, provides public access to the river, reconnecting the neighborhood to water. The creation of this capacity is expected to lay the foundation for commercial, residential and retail construction in the area [12].

The Eagleland and Mission Reach segments, however, are characterized by low-density urbanization and vegetation has been destroyed since 1954 U.S. Army Corps of Engineers project. Few original topographical features are remaining. The project in these areas aims to restore native habitat and the natural meander of the river, along with developing new recreational opportunities. These enhancements are expected to have a broad oriented impact and far-reaching benefits for all of San Antonio, from increased economic development to cultural resources and recreational opportunities connecting neighborhoods [4].

Next part of the research focuses more on the Mission Reach Area, the eight-mile section of the river extending from Lonestar Boulevard south to Loop 410 South.

3.1 Mission Reach Ecosystem Restoration and Recreation Project

The Mission Reach Ecosystem Restoration Project is the primary focus for improvements on the 8-mile Mission Reach segment and is going to have a striking impact on the River south area when it is entirely completed in 2013. The Project includes several steps: construction on the river to reconfigure the channel and create improved aquatic habitat, reestablishing hundreds of acres of native grasses and wildflowers and finally the planting of over 20,000 native trees and shrubs. The culmination of these steps will result in an environmental sustainable water source.

3.1.1 Reconfiguration of the channel, and flood management

Although the channelization of the river is an effective way of managing flood water, it has damaged the ecosystem of the river beyond being visually unappealing.

The Mission Reach project aims at correcting the damage done to the ecosystem by the channelization and restore the river's ecology while providing the same level of flood management that was attained by the channelized river [4].

River channel solutions intend to recreate the natural environment strongly altered within the last 60 years, with sinuous edges and minimizing the 'artificial' channel appearance. The Mission Reach project is focused on the ecosystem restoration, working on the fluvial geomorphology, which is the study of the processes and pressures operating on river systems. This technique will transform the straightened river by adding sinuosity where possible while maintaining flood control, reducing erosion, re-introducing native vegetation and creating an environment more suitable for recreation and wildlife [4].

Design solutions utilize a variety of low flow conditions such as riffles/run/pools sequence, approximately 13 acres of embayments in the river and restoring approximately 113 acres of aquatic habitat. Over 3 million cubic yards of soil are being removed in order to restore and recreate a more natural riverine environment [4].

These types of design solutions will increase habitat diversity and maximize fish and wildlife habitat value (master plan). The alternating sequence of the three river channel habitat types - riffles, pools and runs – usually characterizes balanced environmentally balanced rivers.

“Riffles – A riffle is a shallow area of river with a substrate consisting of rocks. Water usually runs quickly over these areas, creating a choppy surface. Riffles help oxygenate the water, serve as an area to protect fish from predators and are a place where many insect species reproduce or grow to maturity. Some fish species for which riffles are particularly important include the central stoneroller, red shiner, speckled chub, channel catfish, orangthroat darter and the Texas logperch.

Runs – Runs are areas of the river that are of average depth and velocity. Runs generally connect riffles and pools. The San Antonio River, after flood control channelization, consisted entirely of runs. The Mission Reach project restores the structural diversity of the river to support a variety of ecosystem functions and aquatic wildlife.

Pools – Pools are deep areas of water where currents move slowly. Pools generally occur after a run structure, and sediment tends to accumulate at the far end of a pool. Overtime, this will lead to the creation of a new riffle. Pools play a critical role in maintaining water quality in the river by removing impurities from the water, such as sediments. Reducing sediment content of the water benefits a variety of aquatic organisms because suspended sediment can cause the water to be turbid or murky and obstruct fish visibility.

Pools also provide great habitat for different aquatic animals than those found in riffle structures. Larger species, like fish, prefer to live in pools. During drought conditions, when the water level drops, pools provide important refuges for fish until the water level rises. Some species of fish prefer cool water conditions, and the deeper areas provided by pools moderate the temperature during high temperature month.

Embayments – An embayment is a still, crescent-shaped body of water that is formed when a curve in the river becomes separated from the river. Other names for an embayment are oxbow lakes, billabongs and bayous. Embayments were once a natural part of the San Antonio River system and were commonly found on the river's floodplain. Embayments diversify the types of aquatic habitat found within one geographical area. Because the water in embayments does not flow, it can support myriad species of aquatic plants and animals that are adapted to still water bodies. Aquatic and emergent plant species that can easily be uprooted by fast-moving water are capable of living in the shallow, protected embayments.

Embayments also help to improve water quality. When water is directed from stormwater inflows to these areas it is forced to remain in the embayment for a period of time due to the low flow velocity in these areas. During its stay in the embayment, water is processed and

cleaned. Sediment that was carried by the stormwater settles out of the water and into the bottom of the embayment. While the water continues to sit in this water body, some of the impurities, like nutrients and bacteria, are processed by the aquatic vegetation and the bacteria that live in the soil of the embayment.” [4]

Fig. 4-5 Example of transformation of the natural ecosystem. Above left: Pre-channelization at Roosevelt Park near the Lonestar Brewery (circa 1955) Above right: Post-channelization at Roosevelt Park near the Lonestar Brewery (circa 2007) [4].

3.1.2 River's Ecology and Restoration of Flora

The Society for Ecological Restoration defines ecological restoration as an intentional activity that initiates or accelerates the recovery of an ecosystem with respect to its health, integrity and sustainability. The Mission Reach Ecosystem Restoration and Recreation Project is focused at increasing the quality, quantity and diversity of plants and animals (flora and fauna) along the eight miles of the San Antonio River Mission Reach area, and includes the restoration of approximately 334 acres of riparian woodland habitat [4].

Restoring a healthy ecosystem within the Mission Reach of the San Antonio River is a delicate balance of planting appropriate native plants and maintaining efficient floodwater conveyance. New tree masses are being planted including native and indigenous species, and whenever possible, existing tree masses are preserved: over 20,000 young trees and shrubs, 39 native tree and shrub species as well as over 60 native grass and wildlife species. In order to plant additional trees within the flood control channel, additional floodwater capacity must be added. This is proposed for areas where adjacent land is owned by public entities.

Native plants play a crucial role in ecosystem restoration by controlling erosion on the banks of the river. They have long root systems that hold soil in place and aid in improving water quality by filtering out storm water runoff before it enters the river. Native plants also provide food and habitat for native wildlife which leads to increased wildlife in the area. Native plants species have been attentively selected through a deed research based on literature review and analysis of sites where the ecosystem is still intact such as Salado Creek, Goliad State Park, Las Cabras, and others [4].

The Mission Reach vegetation plan has been designed to mimic the diversity and density of native riparian woodlands that exist naturally under both drought and flood conditions.

To achieve this balance, four main vegetation cover types, varying in tree and shrub density, have been incorporated into the design:

- Zone A – 250 trees per acre (most natural condition over time, and these denser areas are usually further from water)
- Zone C – 70 trees per acre (native grass understory in most location)
- Zone D – 27 trees per acre (native grass understory everywhere, and more “park like” tree density)
- Zone E – herbaceous vegetation only – no trees [13]

Vegetation placement follows two main criteria. One is to restore the natural habitat features, the other one is to recreate a recreational environment. Tree placement considerations are based on the analysis of soil moisture, which depends on the distance from the water and seral stages (early mid or late seral).

Nurturing an ecosystem comprised of native plants requires the regular extermination of non-native invasive plant species. Long-term operations and maintenance is critical to the success of the project. Trees were planted approximately two years after each phase of the Mission Reach is open to give the vegetation time to become established. Young, small trees were planted because these trees are more resistant to flooding. As young trees grow in the flood plain, they grow deep roots and adapt to periodic flooding.

When the project is entirely complete, the Mission Reach will look much different than the historic San Antonio Riverwalk and the new Museum Reach area of the river north of downtown. The native landscape will look wild rather than manicured. Grasses and wildflowers will be allowed to grow to their natural heights rather than mowed.

Although the landscape is beautiful and ready to enjoy now, it will take many years for the trees and vegetation to fully mature. The entire ecosystem restoration process will take approximately 50 years for being completed [4].

3.1.3 Park Facilities and Infrastructure

A major component of the Mission Reach project is increasing recreation opportunities on the river. Over 15 miles of trails will stretch along the river for pedestrians and bicyclists to enjoy the landscape. Paddle recreation will be encouraged in designated areas of the Mission Reach. These features will greatly improve the quality of life for River South area residents as well as attract new residents and activities. Boat traffic on the river will be limited to canoes and kayaks rather than barges.

The first section of the Mission Reach Paddling Trail is now open for public access. The total trail is currently 1.6 miles. This section of the river includes four riffle structures that were constructed to improve aquatic habitat. Each of the riffle structures is equipped with a paddling chute that allows paddlers to traverse through the riffle structure. Paddle recreation will be encouraged in designated areas of the Mission Reach. Barge traffic will not be present on this stretch of river, so paddlers can safely navigate the river without interference of motorized boats [4].

This project makes the river more accessible to area neighborhoods by creating eight street connections. The project should be completed by the end of 2013, and will provide the following amenities: over 15 miles of hike/bike trails, over 200 picnic tables and benches, six foot bridges for pedestrian access, four pavilions, four Mission portals, five overlooks with shade structures, nine water edge landings [4].

3.2 Reinforcing Historical Connections

The Mission Reach Ecosystem Restoration Project reestablishes the historic and cultural connections between the river and the San Antonio Missions National Historical Park, as well as provides improved quality of life and recreational access to the river [12].

The 1933 Comprehensive Plan for San Antonio recommended connecting the historic Spanish Missions. The importance of preserving the San Antonio River and linking the Missions became a key local effort in 1953 by the San Antonio Conservation Society and Archdiocese of San Antonio. They commissioned Robert H.H. Hugman to prepare a study to beautify the historic Spanish Missions of San Antonio, and it was decided that this goal could be best achieved by connecting all the missions with a landscaped parkway. In 1959, a plan was presented by nationally renowned planning consultant, Sam Zisman, who proposed developing a scenic park roadway. The program was reinvigorated in 1962 with the Mission Parkway Master Plan [1].

Spanish colonial resources of San Antonio are focal points of the River South area. The community is committed to increasing the boundary of San Antonio Missions National Historical Park to that envisioned since the 1930s. A proposal has been presented to the United States Congress by local leaders to increase the boundary of the existing park lands designated as a national park along the San Antonio River. The proposal is to establish these parcels as a comprehensive Spanish colonial site, the largest in the world. This initiative is tightly timed for completion to meet the National Park Service centennial anniversary in 2016 and the potential designation as World Heritage Site [1].

The Historic Mission Reach will see enhanced quality of life through improved recreational opportunities. Over time this will raise property values of land closer to the river and will increase demand for new and revitalized real estate development, thus creating a more desirable living and working environment for area residents. To maximize economic development potential in the Historic Mission Reach, visible water will be established in this section of the river, where currently the riverbed is nearly dry at times. The River Improvements Project calls for bodies of water to be developed that could vary from two to three times the width of the base flow channel, depending on the ability to widen [4].

Since specific developed land uses have not been projected for the Mission Reach, an estimate of the potential economic impacts associated with potential new employers drawn to this area is premature. However, it is clear that projects in the Mission Reach will have a positive effect on San Antonio's economy that extends well beyond the impact of the construction itself. Taken together, the projects of the Mission Reach will enhance the recreational assets of San Antonio. In particular, infrastructure investment of this type enhances the appeal of the community to existing residents, visitors to the area, and those who are considering San Antonio as a possible site to relocate their family and/or business. The role of this type of "placemaking" in economic development is becoming increasingly well understood, as communities work as hard to attract and retain talent as they once did to corporate relocations [12].

4 Tourism Potential of the Mission Reach

Cultural heritage tourism is "traveling to experience the places and activities that authentically represent the stories and people of the past and present" [14]. It is an economic development tool designed to attract visitors to an area based on the unique aspects of the locality's history, landscape and culture. This not only boosts regional and local pride but is also a good source of revenue for a community and creates jobs. It is estimated by World Tourism organization UNWTO in 2006 that between 35 and 40 percent of tourism today represents cultural tourism or heritage tourism. -Lyon and Wells [15] states "As an alternative to mass tourism, cultural and heritage tourism offer opportunities for place-based engagement that frames contexts for interaction with the "lived space" and "everyday life" [16] of other peoples as well as sites and objects of global historical significance."

Tourism in San Antonio is a multibillion-dollar industry, as millions of tourists who visit the city annually are drawn by the area's rich Southwestern cultural heritage, historical sites and numerous headline attractions. Annual survey information from the Tourism Division of the Governor's Office of Economic Development indicates that Riverwalk, together with the Alamo, boast to be one of the top two tourist attractions in the state [12].

In 1960 an anonymous writer predicted that San Antonio River which developed properly now, could one day become the "crown jewel of Texas": a 1995 study showed that of the 6.5 millions visitors to San Antonio in 1994, the most – 82 per cent – visited the Riverwalk and 27.5 showed the Riverwalk to be the single most important reason of their visit, more than three times the number listing the Alamo [17]. Today, the City receives over 28 million visitors annually.

An extensive research conducted by CSL (Conventions, Sports and Leisure) International as part of the Destination SA project clearly points to the fact that the River experience is the single most important aspect of the San Antonio visitor industry infrastructure. The research also indicates that the continued success of the Riverwalk has led to challenges with high visitor levels beginning to overcrowd a limited area along the River [12].

Mission Reach area specifically aims to attract a high proportion of cultural heritage travelers. A 2009 report found that the 78% of all tourists who are classified as cultural and heritage travelers account 90% of the economic impact from domestic tourism. Cultural tourists spent 50% more during their travels, and traveled one-third further than other leisure travelers. This type of travelers also respect and value the historic, cultural, and natural integrity of the places they visit [18].

According to a recent study, over 1.7 million visited the Missions National Historic Park in 2009, and park visitors, along with staffing, construction and maintenance activities, and other aspects of park operations, contributed nearly \$96.8 million to the local economy and sustained 1,116 jobs in the region. It is expected that reinforcing the historical connection by the River Improvement project will accelerate the tourism activities in the area [J]. Tourists will circulate fluidly along the river beyond the downtown area. The River Improvement Project is making the Riverwalk six times longer [12], thereby mitigating crowding issues and offering an extended River experience including the whole cultural landscape connected with the 19th century Industrial heritage on the Museum Reach and with the Missions, on the Mission Reach.

Another potential economic impact of the Mission Reach River Improvement project is enhancing the appeal of the region to 'eco-tourists'. An increasing number of "eco-tourists" are interested in nature-based travel; a study of North American travelers found that 77% had been on a trip that involved nature, outdoor adventure, or that was experienced in the countryside or wilderness. Of the top-ranked activities for travelers in ecotourism markets, three of the most important elements of a trip include casual walking, wildlife viewing, and hiking/trekking in a park or protected area [12].

By the improvements of aquatic and riparian habitat, fisherman, birdwatchers and other nature enthusiasts will have increased opportunity to enjoy wildlife in the area [4]. The restored ecosystem is generating a serene, natural landscape where visitors can enjoy the inherent beauty of the river.

Regarding the fact that one in ten American travelers shows a very strong preference for both visiting historic and cultural sites and participating in outdoors recreation and nature-based activities [18], the Mission Reach area, because of the ecosystem restoration project, is going to become a real magnet for cultural heritage tourists and eco-tourists [12].

5 Conclusion

The history of transformations of San Antonio River witnesses the alternating relationship between man and his environment and the evolving approach to land use patterns over time:

- In the pre-industrial society, the man's use of natural resources for this area was in a balanced relationship with nature;
- During the 20th century, the man's need of protection from natural disasters – floods – led to interventions which drastically modified the natural features of the river landscape and destroyed the ecosystem balance.

The SARIP shows that the community has understood the necessity to recreate a balanced environment for a sustainable future. The project has the goal to reconnect citizens to their natural resources which represent not only their legacy but also the key to maintain the city's future economic vitality and quality of life.

The SARIP impact is foreseen to be amazing at a broader scale, driving back the inhabitants to use their natural resources and to appreciate their cultural heritage. This project also represents an economic stimulus for a virtuous development of cultural heritage tourism and eco-tourism.

Abstract

Antalya is characterized by historic sites and monuments of great importance dating from Hellenistic, Roman, Byzantine, Seljukian and Ottoman periods and is one of Turkey's most popular tourist destinations.

Xanthos-Letoon, Antalya, is inscribed in the UNESCO World Heritage List since 1988 and the city has also seven nominated properties in the tentative list.

In 1980, tourism was encouraged to constitute a new sector as an economic and political objective and now the number of tourists visiting Antalya has reached 10.7 million.

Besides the positive effects of the tourism development, some other problems occurred, such as rapid population growth and the speedy consumption of the historical, natural, and cultural resources related to this rise.

By the time tourism industry in the area has mostly focused on sea-sun-sand tourism. Historical, natural and cultural entities have almost been forgotten, and the heritage management has become an important issue to be considered seriously.

Within this context, this paper focuses on how to put forward the real values of Antalya's identity and encourage heritage tourism as a sustainable alternative. This paper discusses the strategies to enhance and accelerate the heritage tourism in Antalya, to improve the interaction between historic heritage and tourists while managing heritage sites visited by tourist flow, and to re-interpret the identity of Antalya, Turkey, as a province of many notable urban/ archaeological world heritage sites.

Keywords: cultural heritage tourism, heritage site management, world heritage sites, Antalya.

1. Introduction

The heritage sites have been frequently remembered together with tourism and have been usually accepted as the reason of attraction to many destinations. Rome, Athens and Istanbul are the cities to be mentioned as the touristic destinations mainly as a result of the richness and diversity of the cultural heritage sites located in and around these cities. On the other hand, Antalya on the south coastline of Turkey has a problem in interpretation and presentation of its abundant number of urban/ archaeological heritage sites, of which one is [1] in the World Heritage Sites (WHS) List of UNESCO and seven are in the Tentative List [2]. Although, having such invaluable heritage sites in a comparatively short distance, tourism in Antalya is not heritage tourism focused, partly as a result of dominance of the exceptionally good weather and coasts it offers to the tourists. When the annual visitor number to the above mentioned heritage sites is compared with the total number of annual tourists to Antalya Province, it can be clearly found that the heritage sites are not the leading/ generating side of the tourism in Antalya, Turkey's most popular tourist destination [3] (Table 1). This research seeks to develop strategies for increasing the recognition of the heritage sites in Antalya and for converting the city's identity from a beach resort to a city of a diverse heritage.

Heritage Sites		WHS Status	Number of visitors	Percentage*
The city of Alanya		Tentative List (since 2000)	Approx. 2.500.000	% 23.3
Archaeological Site of Perge		Tentative List (since 2009)	272.655	% 2.54
Xanthos-Letoon		World Heritage List (since 1988)	47.558	% 0.44
Ancient Cities of Lycian Civilization	Patara	Tentative List (since 2009)	155.745	% 1.45
	Olympos		259.083	% 2.41
	Myra		448.210	% 4.18
St. Nicholas Church		Tentative List (since 2000)	485.052	% 4.52
Karain Cave		Tentative List (since 1994)	29.359	% 0.27
Kekova		Tentative List (since 2000)	34.398	% 0.32
Güllük Dagi-Termessos National Park		Tentative List (since 2000)	35.439	% 0.33

* Number of tourists visiting Heritage Sites in Antalya / Total number of tourists visiting Antalya in 2012 (Total number of tourists visiting Antalya in 2012 is 10.726.136)

Table 1: Number of visitations in World Heritage Sites of Antalya in 2012

2. The Tourist City: Antalya

Antalya is Turkey's most popular tourist destination since 1980's. It has been a very important maritime city throughout its history because of its geography and climate. Both natural and historical patterns work together to form the traditional character of the city of Antalya.

The population of Antalya began to increase in 1950's due to an increase in immigration [4]. It was 1953 when the word 'tourism' began to be used in earnest and a law promoting the tourism industry was accepted by the Parliament in that same year. Since the 1960's, tourism in the Antalya region has been a priority for the country, motivated by Antalya's densely natural and historical value. In 1969, the Turkish government defined a three-kilometer band of the Aegean and Mediterranean as a dedicated tourism region. In 1973, the Ministry of Culture and Tourism had the Master Plan of Antalya prepared. 1980 was a turning point for the tourism in Turkey and Antalya. In 1980, tourism was further encouraged in Turkey as a new sector, with economic and political objectives [4]. The support given to tourism entrepreneurs by the government through the government's decisions regarding tourism planning has accelerated the demand for resort accommodations. In the meanwhile the city Antalya, situated on the South coast of Turkey, is favored by its climate, natural beauty and historical patterns. From the 1980's on, through the support of foreign investment aimed at benefitting from this growing industry, a different process began. This process was later improved-upon through the franchise chain system.

Tourism is now the second-largest industry in Turkey, attracting a total of 31.7 million visitors per year. Today the number of tourists visiting Antalya alone has reached 10.7 million visitors per year. Antalya has attracted visitors from Germany, Russia, Austria, Sweden, the UK, Netherlands, France, Denmark, Belgium, Norway, Poland, and the Ukraine. The visitors from Germany (28%) and Russia (27% – after the collapse of the Soviet Union) make up 55% of the market share in tourism in the city [5]. The plan of 1973 projected a 174,000-bed capacity by the year 2000 in Antalya. However, the number of beds exceeded the target bed number and reached 230,000 in 2000; today Antalya has a 412,000-bed capacity [4]. Tourists visiting Antalya increased from 800,000 to 7,000,000 in twenty-five years' time from 1980 to 2005.

Through this process, the tourism construction has quickly accelerated and mass tourism has widely grown up on its coasts [6]. The rapid growth of Tourism in Antalya since 1980's had caused a comprehensive change in its social and physical characteristics. There have been developed a range of accommodation from hostels at the lower end, small boutique hotels in the middle range, relatively large holiday villages and high-quality five-star hotels at the top.

Throughout this rapid acceleration in the city's tourism industry, tourists' profiles, their demographics, demands and expectations, management and marketing strategies have also evolved. The increasing number of chain hotels has caused an improvement in institutionalization and standardized spatial organization in the city. Tourists expecting an inexpensive vacation have begun to flock to city, especially after tour operators began to take a more active role in marketing and the local resorts expanded to incorporate an all-inclusive accommodation system.

Fig. 1: Important Archeological Sites, WHL and Tentative Lists sites in the region

The city is mostly known for the beauty of its coasts and warm, beach-friendly weather throughout the year. Besides the sun-sea-sand tourism, Antalya contains attractive tourism elements that cater for a wide range of interests. Tourism investments have turned the province into the country's leading golf resort. On the other hand, the inland mountain areas cater for hikers and climbers, and the unspoiled nature for the eco-tourism [7]. However, although the city's invaluable historic heritage sites are mentioned in most of the tourism marketing campaigns, they do not attract the national/ international visitors as much as they deserve to. The province of Antalya is located on two regions of ancient geography in the south of Asia Minor: Lycia and Pamphylia (Fig.1). The ancient cities settled in these regions were among the largest and wealthiest cities of ancient Greek and Roman periods, and most of them continued to be important through Byzantine times. Excavations have been going on in most of these ancient cities for decades. Among these numerous number of cities shown on Fig.1, two sites of Lycia, one capital city if it and the other the sacred site of three temples, are in the list of WHL and seven others have been put into tentative list, which is the inventory of those properties which each State Party intends to consider for nomination to WHL [8]. However the visitor numbers to these sites (Table 1) are not comparable to the annual number of visitors to the province. So, it can be stated that the heritage tourism is under the shadow of sea-sun-sand tourism in Antalya.

3. Management and Sustainability of Cultural Heritage Tourism

International tourism is one of the globally and remarkably growing sectors since 1950's mostly due to the development of airlines and its attainability for middle class and the increase in the flow of information. The number of international arrivals was 25,3 million in 1950, 222,3 million in 1975, 455,9 million in 1990 and 760 million in 2004. The receipts in the international tourism have grown in parallel from 2,1 billion US\$ to 523,1 billion US\$ from 1950 to 2003 [9]. The economical, political, social, and technological developments throughout the world have lead to significant changes in tourism consumption models and during the early 1970s, the *cautionary platform* emerged and attention was drawn to the more negative consequences of tourism. It is pointed that the costs of tourism to the local economy, including environmental impacts in destination areas, problems with seasonality, pressure on local facilities and changes in hosts' lifestyles are brought about by the presence of tourism and tourists. In the late 1970s Cohen (1978) argued that attention was being overly focused on tourism's negative effects. After that, several types of non-mass tourism such as, 'sustainable tourism', 'ecotourism' and 'rural tourism' were advocated as being less damaging to society and environment [10]. The quest for sustainable tourism alternatives has been continued increasingly as the discussions on the concepts like sustainability, global warming and ecology have been intensified.

On the other hand, the demands of international visitors have also tended to change. Baraner [11] indicates that tourists' demands for variety and innovation will increase, be polarized, and switch from the '3S' (Sea, Sand, and Sun) to the '3E' (Education, Entertainment, and the Environment) in the coming years. He also identifies the primary long-term tourism trends as: sustainability, inexpensive but high-quality resorts, multiple destination vacations, exotic and authentic locations, unique

experiences, adventure and excitement focused vacations, cultural tours and activities, recreation and sports, health and wellness, and individual tours. Finally, Baraner [11] argues that investors should focus on consumer-based sustainable tourism alternatives in order to have balanced tourism development. Within this context, the aim of these tourism alternatives has been to improve the tourism phenomenon in such a way to contribute the regional economy and social life permanently without destroying the environment, society, and historical, natural and cultural entities. It is necessary to preserve these values in tourism as the tourist season ranges over twelve months a year, to take the concept of tourism out of the monopoly of sea-sun-sand, and to diversify by means of new concepts directed to alternative tourism and enlarge the possibilities for investment [10].

Heritage is a broad concept and includes the natural as well as the cultural environment. It encompasses landscapes, historic places, sites and built environments, as well as biodiversity, collections, past and continuing cultural practices, knowledge and living experiences. It records and expresses the long processes of historic development, forming the essence of diverse national, regional, indigenous and local identities and is an integral part of modern life. It is a dynamic reference point and positive instrument for growth and change. The particular heritage and collective memory of each locality or community is irreplaceable and an important foundation for development, both now and into the future [12]. Heritage had always been an important actor of tourism since the ancient times [13]. Cultural Heritage Tourism is a part of the cultural tourism and is defined as 'visits by persons from outside the host community motivated wholly or in part by interest in historical, artistic, scientific or lifestyle/heritage offerings of a community, region, group or institution'. This is a useful definition of the phenomenon as it recognizes that the motivation of visitors to experience 'culture' in some way is what separates it from other forms of tourism [14].

Although, cultural heritage tourism and sustainability evidently share a common theme, there has been paid very little attention to explore the relation of these two concepts [15]. The increasing recognition of sustainable development has resulted in tourism being viewed as an activity, which could be developed in conformity with the objectives of this concept. The 1982 Joint Declaration of the World Tourism Organization (WTO) and the United Nations Environment Program (UNEP) expresses the goal of sustainable tourism as *'The protection, enhancement, and improvement of the various components of man's environment are among the fundamental conditions for the harmonious development of tourism. Similarly, rational management of tourism may contribute to a large extent to protecting and developing the physical environment and the cultural heritage, as well as improving the quality of life'* [16]. On the other hand, even though the pivotal idea in both of the definitions of 'sustainability' and 'heritage tourism' is clearly that of 'inheritance', the connection between these two concepts still remains largely unexplored [15].

At a time of increasing globalization, the protection, conservation, interpretation and presentation of the heritage and cultural diversity of any particular place or region are important challenges for people everywhere [12]. Most countries encourage the preservation of heritage as an asset for all the community. It can be used to evoke a sense of continuity of culture, enrichment of people's lives, as a link with the past and to allow society to make sense of the present. Heritage sites are multi-purpose - they provide a wide range of tourist attractions, a focus for community identity, a valuable resource for formal and informal education and in some crises, such as the inner cities, the basis for the economic regeneration of an area. The four variables under consideration are tourist attraction, community identity, formal and informal education, and economic regeneration [17]. Heritage sites provide the tangible links between past, present and future and ideally cultural heritage tourism should bring economic benefits to host communities and provide a significant means and motivation for them to manage their cultural heritage and continuing traditions [14].

Management of heritage sites has become a widely discussed concept in last ten years after it was highlighted in the 'Operational Guidelines for the Implementation of the World Heritage Convention' of 2005 [18] and the guide for 'Management Plans for World Heritage Sites' was published by UNESCO German Commission in 2008 [19]. The management plans are thought to be the implementation tools for achieving a balance between the conservation and restoration of cultural heritage, the priorities and needs of local community, and development of tourism and economy. A management plan takes the task of a framework that set forth the guidelines for future decisions. A management plan aims to ensure conservation of significance and values of the site and its sustainability and to help the local community and visitors in appreciating the significance and values of the site.

Although tourism is a positive force for the preservation of the heritage sites because of its ability to draw world attention to their importance, excessive visitation is in conflict with the initial goal of the management plans, and challenges the sustainability of those sites [20]. Tourism industry supports the protection of cultural heritage for future generations of the host community and visitors, and co-operation between the stakeholders is a basic necessity for a sustainable tourism industry [14].

Otherwise, heritage sites become the focus for the struggle between the potentially conflicting aspirations of conservation and tourism. Good heritage management with a major focus on heritage interpretation and presentation ensures that one complements the other. It enables the critical balance

Fig. 2: Archaeological Site of Perge

to be maintained between the needs of the resource and the needs of the visitor. Through education and entertainment and the enjoyment of heritage attractions such as nature reserves, national parks, museums, historic houses and gardens, villages or towns by people of all ages and socioeconomic groups with different lifestyles, it is possible to develop a climate of conservation awareness [17]. The involvement and co-operation of local and/or indigenous community representatives, conservationists, tourism operators, property owners, policy makers, those preparing national development plans and site managers is necessary to achieve a sustainable tourism industry and enhance the protection of heritage resources for future generations [12].

The management plans are intended to form a framework for different topics for achieving a balance to be maintained between the needs of the stakeholders and the necessities for the sustainability of the heritage site. These topics can be summarized as 'archaeology', 'conservation', 'tourism management', 'social geography', 'urban planning', 'environmental research', 'restoration', 'education', 'risk management', 'museology' and 'community outreach'. Many of these topics are related with 'community interpretation' and 'presentation' of the heritage site. Through interpretation and presentation, the unique attributes of the heritage sites can be emphasized and accommodate the needs of the visitors [17]. Through the process of preparation of the management plan sustainable conservation and management is the expected outcome. For achieving this goal, long-term conservation decisions and plans are settled, the expectations from the site are defined, social economic and politic framework is designated and recent trends and developments in related fields like archaeology, archaeometry, conservation are comprised in the management plans.

4. Management of Heritage Sites of Antalya in WHS List and Tentative List

As mentioned before, province of Antalya is settled on the ancient Lycia and Pamphylia regions and invaluable archaeological, architectural, natural, urban heritage sites are located in the borders of the province (Fig.1). Eight of these sites are either in WHS List or in Tentative List, namely Xanthos-Letoon, the city of Alanya, Archaeological Site of Perge (Fig.2), Ancient Cities of Lycian Civilization (Patara, Olympos and Myra), St. Nicholas Church, Karain Cave, Kekova, Güllük Dagı-Termessos National Park (Table 1) [2]. Unfortunately, the annual number of tourists in Antalya is not reflected in the number of tourists visiting these heritage sites. Among the listed heritage sites, Alanya seems to

Fig. 3: St. Nicholas Church and the excavations in the site, Demre [25]

have the utmost number of visitors, which is approx. 2,500,000. However, this number does not reflect the visitors to the historic cores of the city, located on the west slopes of Kandleri Peninsula and aside from the new developed areas. Indicatively, only 343.724 of 2,500,000 have visited the Alanya Castle [3].

The second most visited heritage sites among the listed group is St. Nicholas Church, visited by 485,052 visitors in 2012 and its' neighbor heritage site in Demre, Myra, visited by 448,210 visitors in 2012 (Table 1). Surprisingly, St. Nicholas Church of Myra, which is a pilgrimage and a very important site for Christianity, could only host %4,52 of the total number of tourists visiting Antalya. The number of visitors to Xanthos-Letoon that had reached to only 47,558 (%0,44) is even more unanticipated, as this heritage site, comprised of the capital city and sacred site of Lycians is the only one in WHL among the listed sites. The attention given to the listed sites is quite different than what is expected from the WHL and Tentative List sites. In the article titled as '*Does world heritage list really induce more tourists? Evidence from Macau*', it is discussed that UNESCO recognition has been widely used as an advertisement to attract tourists and being on the WHL seems to be effective for increasing global visibility and tourist arrivals. Furthermore, it was stated that the accreditation of the World Heritage List (WHL) was meant to identify, recognize, and protect scenic spots of global value, the WHL is now widely used as a marketing tool for national tourism campaigns and this strategy is rooted in the belief that the WHL is a powerful boost for attracting tourism [21]. In the same research, visitation increases the threat of damage or destruction of the environmental and cultural integrity of the WHSs due to excess number of tourists and an emerging line of research has focused on discussing how to achieve a balance between strict protection of WHSs and tourism development [21]. Similarly, in another paper titled as 'Tourism Development of World Heritage Sites in China: A Geographic Perspective', it is discussed that World Heritage Sites are increasingly used as tools for national tourism marketing campaigns and these campaigns draw vast numbers of visitors, and increase the international visibility of destinations through the promotional and informational policies generated by the private sector, the host country, and the World Heritage Committee. As a result, being designated as a World Heritage Site is a coveted prize, and regarded as a means of increasing tourism. In 1998, recorded annual visits to 116 of the World Natural Heritage Sites was roughly 63 million and this was almost one-tenth of international tourist arrivals, and all indications point to an increasing World Heritage Site visitation [20]. In another research it is indicated that designation is regarded very favorably by countries as a means of attracting more tourists and is a highly sought-after prize. "The coveted UNESCO designation of World Heritage Site is used for national

agrandissement and commercial advantage within the international competition for tourists, more often than it is a celebration of an international identity" [16].

So, if designation is regarded very favorably by countries for increasing the international visibility of destinations and regarded as a means of increasing tourism, why Xanthos-Letoon in WHL and other sites in TL, do not attract tourists to the area and do not even have a remarkable share from the visitors of the province. Erturk proposes that importance of Archaeological sites, ancient monuments and antiquities, as well as their values, have not been fostered in Turkey and in addition to a lack of awareness, the lack of financial resources and the lack of quality control/ monitoring are also major problems in the management of heritage sites. Insufficient number of staff and lack of communication between tourism and cultural sectors are the other factors listed by Erturk. Most of the travel agencies act independently and without any clear objectives. While one site receives visitors by busloads and becomes a must-see for all tour organizers, another nearby remains almost deserted [22]. The general framework, which is expected from the management plans seem to be missing for the heritage sites of Turkey.

The community interpretation and presentation, mentioned above, as the main concepts of site management also seem to be not properly working. Mostly, the local community does not have strong links with these sites, and they do not have chances to interact with them. Most of the archaeological and historic sites seem to them as enclosed with wire fences and allocated only for tourism. Both in the marketing campaigns of Antalya, and within the heritage sites, emphasize given to enhance the knowledge of audience on these sites is quite low. Fortunately, a new regulation entitled, "*Legislation on the methods and principles concerning establishment and duties of 'Site Management and Monument Council' and identification of 'sites to have management plans'*" was put into force in 27th November 2005, by the Ministry, and this recent attempt will hopefully help to protect and evaluate the archaeological sites within the framework of sustainable management [23]. Lately Ministry of Tourism and Culture enforces all the archaeological excavation teams to have their management plans prepared. The aim of this regulation is to ensure that archaeological sites, conservation sites, their interactive areas and junction points be conserved and evaluated within the scope of a sustainable management plan in coordination with public institutions and organizations, civil society organizations, and put forward the substance and procedures for the identification and development of management sites, preparation, approval, implementation and supervision of management plans and the determination of the duties, powers and responsibilities of the advisory board, site manager, coordination and audit board, audit unit and monument council that will have the function of managing the site [23]. The objectives of the site management are designated as:

- a) *Accurate delineation of the area for conservation, development and evaluation in its historical, social, cultural, geographical, natural, artistic integrity, and of its interactive areas and associated historical, cultural, geographical, natural, artistic junction points,*
- b) *within the scope of a management plan, demonstrating ways to find an appropriate balance between the needs for conservation, access, sustainable economic development and the interest of the local community,*
- c) *development of overall strategies, methods and tools to raise the value of the area to an international level, location of resources and fund raising,*
- d) *set up an active network of international cooperation and sharing with the view of developing cultural tourism,*
- e) *drafting implementation plans to develop regional cultural systems comprising conservation sites that have the potential to form a cluster by being associated with each other in a specific region,*
- f) *cooperation between public institutions and organizations, civil society organizations, persons with right to property in the area, persons and organizations working on a voluntary basis and the local community in conserving and evaluating management sites,*
- g) *in addition to conservation through maintenance, repair, restoration, restitution, exhibition, arrangement and landscaping of conservation sites, architectural sites and interactive areas in line with site management objectives within the framework of international principles of conservation and convention provisions, determination of principles and limits of use and development,*
- h) *utilization of high standards in the management of cultural property, site of conservation, design and implementation, expertise and equipment* [23].

In 'The Valletta Principles for the Safeguarding and Management of Historic Cities, Towns and Urban Areas', adopted by the 17th ICOMOS General Assembly on 28 November 2011, the importance of participatory process for the production of a site management plan was pointed out. Consideration of the diversity and uniqueness of each site and its importance for the effective management systems was also mentioned. The management plan is anticipated to determine the cultural values; identify stakeholders and their values; identify potential conflicts; determine conservation targets; determine legal, financial, administrative and technical methods and tools; understand strengths, weaknesses,

opportunities and threats; define suitable strategies, deadlines for the work, and specific actions [24]. Considering all of these developments in the area of heritage management, this paper concludes with the proposal of an integrated management model in order to provide a sustainable strategy for the protection of cultural heritage while accelerating heritage tourism in Antalya, Turkey. As mentioned above lack of communication among the Ministry of Culture and Tourism, tourism and cultural sectors, public institutions and organizations, civil society organizations, and local communities causes organization and interpretation problems. An overall management plan, besides the single management plans, for the heritage sites in Antalya, involving all the stakeholders and coordinating a comprehensive interpretation and presentation program of the listed heritage sites will improve the awareness of the public and attraction of these sites.

5. Conclusion

Turkey is one of the world's crossroads, with evidence of at least 13 different civilizations from Hattis to Ottomans [22]. In order to keep up with the developments in the world and increasing level of concern to the historical, cultural and natural entities, Turkey should preserve its rich cultural heritage, and incorporate them with sustainable tourism activities [6]. Sustainable tourism development would entail the adoption of planning strategies to mitigate the negative impact of tourism without sacrificing its benefits [16]. A sustainable management plan and long-term planning for cultural heritage tourism with an integral, continuing conservation policy, is essential for the heritage sites of Turkey in ensuring a quality experience for the visitor [17].

The objectives of management plans brought by the related regulation (Legislation on the methods and principles concerning establishment and duties of 'Site Management and Monument Council' and identification of 'sites to have management plans') in 2005, seems to be quite comprehensive. In this regard, it is obvious that an integrated regional management plan for the WHL and TL sites of Antalya would be beneficial to protect natural and cultural heritage characteristics, and accelerate cultural heritage tourism in the area. The management plan should develop overall strategies, methods and tools to promote and raise the value of the area to an international level, determine the duties, powers and responsibilities of the site managers and the advisory board that includes members from all parties involved. It is obvious that the Ministry of Culture and Tourism should undertake a master plan for the management of heritage sites by working with key players, such as archaeologists, academicians, local people, NGO's and other related people or institutions working in the heritage field in Turkey. The Ministry of Culture and Tourism should work closely with travel agencies, as well as the decision-makers in the tourism sector, in order to develop common objectives for better management. This collaborative effort should include four stages [22]: identification of problems or difficulties; prioritization; suggestions and the application process. Sharing resources with the help of integrated regional management plan would create partnership opportunities, from which mutual benefit could be achieved [20].

Utilizing the power of tourism to merge people with different historical and cultural background, it is necessary for the local people to be involved in planning for conservation and tourism activities which should benefit the host community as well. The relationship between heritage places and tourism should be managed in a sustainable way for present and future generations. Since domestic and international tourism is among the foremost vehicles for cultural exchange, conservation should provide responsible and well-managed opportunities for members of the host community and visitors to experience and understand that community's heritage and culture at first hand [12].

THE HISTORIC CENTER OF LIMA, PERU: A GIS DATABASE AS A TOOL FOR SAFEGUARDING AND DEVELOPING

Angela LOMBARDI,¹ Patrizia MONTUORI²

Abstract

The city of Lima, Peru, is today one of the greatest metropolitan areas in Latin America with nine millions of inhabitants. Lima's historic center, designated UNESCO World Heritage Site in 1999, still maintains its original 16th century city layout, with few later transformations, and a dense and rich architectural heritage. However, in 2008, was included in the World Monuments Watch List as one of the world's most endangered sites: many historic buildings are in poor condition, both as a result of neglect and deliberate decay for future speculative development. Recently, in November 2012, one of the few 18th century multistory buildings, the *Casona El Buque*, dramatically collapsed.

A methodological approach for successful rehabilitation strategies has been created with the necessity of surveying the features of current urban fabric.

The survey, organized in documentation forms, is going to be implemented within a GIS database. It analyzes various types of structures and takes under consideration several parameters: conditions of the existing architectural heritage, preservation of the fragile materials constituting historic structures, definition of boundaries for 'compatible' reuses of historic buildings, quality life improvements for inhabitants.

The survey represents an investigative tool preliminary to any restoration program and could become a reference point for local institution to define guidelines for protection and revitalization of the historic center.

Keywords: Peru, Lima, Cultural Heritage, Conservation, GIS;

1. Lima: History and Complexity of an Architectural Heritage at Risk.

Lima has been the capital of Viceroyalty of Peru, the most important and wealthy city among the Spanish colonies of Southern America.

Since 10,000 B.C., its territory was inhabited by civilizations of great importance, whose magnificent historical and architectural evidences are still visible in the landscape.

The cityscape is composed by buildings, archaeological remains and urban spaces dating from pre-Hispanic, Vice-royal and Republican period and it is an heritage of great historical and artistic value while in an advanced decay and threatened by speculative pressures.

In 1533 the Spaniards reach for the first time the valley where the actual capital is founded, the city of Lima is officially founded only on January 6, 1535, the Feast day of Epiphany and it is named *Ciudad de los Reyes*, to commemorate the three Wise Men.

The Spaniards encounter in this location, on the western bank of the river Rímac, a wide Inca settlement which consisted of earthen constructions or *huacas*, a series of platforms,

enclosures, paths and by an articulated and dense network of artificial water ditches built for an effective irrigation of the farmlands.

The Pre-colombian territory, dominated by the Incas, was characterized by a hierarchical subdivision of the land and was organized in provinces, which were subdivided in districts, called *hunu*.

The settlement where Francisco Pizarro decided to found the new capital was the palace of *curaca o cacique* Taulichusco, and was the spot from which all the irrigation ditches of a whole *hunu* were controlled. Even, these irrigation ditches are known and identifiable with streets following the imprint of the ancient irrigation channels [1].

The location of the new founded city, which was destined to become the capital of the Viceroyalty of Peru, is strategically chosen by the Spanish conqueror in order to control the territory and the symbols of power of the Spanish Crown are intended to overlap, to prevail and to obliterate those of the great Inca civilization.

The Viceroyal city, therefore, overlaps with an important pre-Hispanic settlement; on the *huacas*, placed in strategic positions, are built the most representative institutions for the new city: the cathedral, the *Cabildo*, the Archbishop palace, etc. and also the palaces of Pizarro and his companions. Classical urban models are followed, the city is organized in blocks with an orthogonal grid, in particular, for Lima the model used is the one today called *Modelo Pragmatico* (Pragmatical Model) where the main plaza, *Plaza Mayor*, was built on the *huaca* of Taulichusco [2].

The Historic Center still houses some pre-Hispanic remains, identified in the 50s of twentieth century by Emilio Harth Terré; however their historiographical identification has yet to be established [1].

Lima, as capital of the Viceroyalty of Peru, during seventeenth, eighteenth and first twenty years of twentieth centuries, is the most important and richest city of South America, with not only highly representative civil and religious monuments but also with rich residences and with a significant vernacular architecture: great artistic, historic, typological, stylistic, and constructive relevance concern numerous convents, churches and religious buildings belonging to different religious Orders (four of them already founded prior to 1553 [2]), residential buildings with various typologies, such as the "courtyard house", probably of Castellan/Spanish/Moorish origin but used here with several alterations. Architectural elements of great value in the Viceroyal edifices are the famed wooden balconies, of Spanish-Moorish origin and the *teatinas*, wooden skylights located on flat roofs.

The Historic Center today still preserves almost intact his original Spanish urban layout and later extensions, all conceived following urban models developed in the motherland referring to 'ideal' Renaissance urban planning, classical architecture and Hippodamic orthogonal street grid.

The city, during the Viceroyal period, is spread within city walls built in 1685 while many buildings are rebuilt several times, because of frequent strong earthquakes (1555, 1586, 1655, 1687, 1746, 1806 – tsunami -, 1868, etc). During reconstruction processes, the previously used construction techniques, mostly imported from Spain, are implemented and merge with pre-Hispanic technologies, better responding to seismic shocks.

After independence of Viceroyalty of Peru from the Spanish Empire (1821), Viceroyal period Lima's urban structure, construction systems and architectural types remain substantially unchanged for several years.

However, during the Republican period, the increase of trade with foreign countries encourages foreign immigration, especially from Europe, and the architecture of Lima begins to feel the European influence, in particular of the English and Italian style.

From the second half of the nineteenth century, the urban structure begins to be modified for aesthetic and functional reasons. Between 1868 and 1870, Viceroyal city walls were demolished and in freed area is realized a new annular road along which some important public buildings are built (for example The *Palacio de la Exposición*, 1869-71; the *Hospital Dos de Mayo*, 1868-75; the *Escuela de Artes y Oficios* 1870; the *Escuela de Medicina de San Fernando*, 1903), inspired by the urban transformation envisioned by the Ring in Vienna (1859-1872).

Instead from the intervention of Haussmann in Paris is shooting the model of boulevard road, which is superimposed on the Viceroyal city grid and introduces in Lima a completely new type of urban space and scale.

Along the boulevard is also built a new housing type, the "compact house", usually in French Beaux Arts style, different from the "courtyard house" typical of the Viceroyal period.

However, the traditional building techniques continue to be used until the twenties when, thanks to private investment, start to be built tall buildings in reinforced concrete and brick, which permanently altered the image and the skyline of the historic city [3].

From the first half of the twentieth century, the Historic Center of Lima begins to undergo significant changes, not only urban and architectural but also social.

Wealthy families, who traditionally lived in the foundation grid of Renaissance period, move to the suburbs in the new expansion's quarters, and the center begins to accommodate the poorer sections of the population. The rich single-family houses of Viceroyal and Republican period are abandoned and occupied by several families, who cannot operate the maintenance and conservation interventions of the buildings due to the lack of economic resources.

In 1991 the Historic Center of Lima, which is large only a quarter of the old city center, has been designated by UNESCO as a World Heritage Site, but about one hundred monuments and thousands of houses with architectural and historic values are still in a neglect state and at risk of collapse.

Today, the Historic Center of Lima seems to have two faces: the touristic one, with urban spaces and buildings apparently well preserved, however, that often hide serious problems of degradation; the other one, threatened by serious mutilation to the historical and artistic heritage, by traffic and pollution, by economic and unsolved social problems and the low quality of life of residents.

In general the perception of the great historical and architectonic value of the center of Lima seems to be low, considered simply an economically advantageous place where to focus the interests of a speculative nature for the abundance of customers.

1.1 Lima's Traditional Construction Techniques and Related Issues Jeopardizing their Conservation (Angela LOMBARDI)

Geographical and climatic features have largely shaped the construction of Lima's architecture. Peru is located just in front of the Nazca Tectonic Plate which interacts with the South American Plate making the coastline one of the most seismically active area of the planet. Based on its geographical location, the area ought to have a tropical climate but Humboldt Current prevents the formation of rain clouds, for these reasons the city has a temperate marine climate. The temperatures oscillate between 14 and 20° C in winter, and between 18 and 30°C in summer. Lima's climate is characterized by a very high relative humidity, the absence of rain and wind. In the pre-Hispanic era, the almost total lack of rainfall allowed the construction of buildings made of natural materials found in the local area, such as mud, cane and wood. This made for a light and flexible construction system known as *quincha*, appropriate for the seismic condition of the area. With the Spanish foundation of Lima in 1535, builders who arrived with the conquerors, attempt to introduce European construction systems: can be dated in 1538 the installation of the first kiln for brick production in order to allow the implementation of masonry construction systems, considered to be more resistant and effective and fair expression of the Spanish rule.

Religious buildings, dating from sixteenth and seventeenth century, highest expression of Lima's Viceroyal architecture, are built with brick and stone walls and brick ribbed vaulted ceilings which were still being used in the Spanish Isabellian Gothic Architecture, then replaced in 17th century by barrel vaults with lunettes, always made of bricks [5].

Following the earthquake of 1687 and the collapse of barrel vaulted ceilings, in the church of *San Francisco de Lima*, are developed new architectural and structural solutions which interfuse the know-how of two building cultures, the indigenous and the European.

The result is the Viceroyal *quincha*: a wooden structure with a reed lattice framework and coated with mud, analogous to the pre-Hispanic construction system, but requiring the incorporation of new carpentry techniques. Credit for this revolutionary innovation is given to its designers, Portuguese architect Constantino de Vasconcelos (d. 1668), and his

Peruvian assistant Manuel de Escobar (1639-1693), who both supervised the construction of the vaulted ceiling until completion [5].

The earthquake of 1746, which had devastating effects, confirms the stable seismic performance of the Viceroyal *quincha*: under seismic shock, it withstands deformation thanks to its resilience, absorbs vibrations, avoiding movement propagation to the rest of the structure, and, thanks to its lightness, reduces loads on the building.

Its use becomes widespread, not only in modest buildings but also in large and opulent constructions consolidating its identity as the traditional construction technique of Lima.

The use of *quincha* is associated with other similar materials and techniques; it has often been used for specific architectural elements, primarily on upper floors, such as walls or partitions, balconies, *teatinas* (dormer-type skylights), arches, vaulted ceilings, dome ceilings, towers, bell towers and windowed balconies. Elements of higher density and rigidity are placed on the lower floor: stone foundations with limestone mortar; stem walls made of brick; and adobe walls with brick reinforcement in corners, doors and windows [5].

The term *quincha* reveals (and claims) its pre-Hispanic origin, word of *quechua* origin, typically used to identify the walls of primitive huts or of other simple constructions made of cane or bamboo and mud by the indigenous peoples. A good description of these structures is given by Bernabé Cobo in his *Historia del Nuevo Mundo* (1613-1653). Surprisingly, however, *quincha* construction has received only a general and inadequate attention in art literature of Spanish colonial architecture; its importance and impact for the development of an original architectural expression still awaiting recognition in the history of construction [6]

Quincha, used in association with adobe bricks, is the traditional construction technique most widely used, thanks to technical performances and low cost; even utilized in modern buildings of the early twentieth century 20s, it is replaced only by the advent of reinforced concrete.

Quincha, even today characterizes the architecture of the city and, even more, it represents its real material identity, demonstrating, as well, the validity of a building tradition of pre-Hispanic origin.

Historically earthen architecture has always presented great advantages, both for the easy availability and workability of the raw material, both for the moderate cost. On the other side, it is made of perishable materials. The high perishability of *quincha* materials (wood, reed lattice and coating of mud mixed with straw, horse manure, lime or lime and sand) requires continuous maintenance, while adapting perfectly to Lima's climate, poor of rainfall. Mud high thermal inertia also ensures a good thermal insulation [5].

Large areas of the historic center are characterized by an advanced physical deterioration of its architectural heritage, with structural elements on the verge of collapse as well as functional obsolescence.

In the 1990s, lived in buildings on the verge of collapse approximately 100,000 people. The causes of the advanced levels of deterioration were most varied, including damp foundations, sub-standard hygienic conditions, lack of drinkable water in rented buildings, lack of maintenance due to rent control which determines the low rents, and lack of maintenance due to abandonment of properties in the hope they will eventually collapse. There is considerable speculative pressure on vacant plots left, which after demolition, may be used as highly remunerative car parking areas.

The old and deteriorated parts of the city are inhabited by low-income people who live in rented buildings and housing complexes are referred with the derogative name of *áreas tugurizadas* (slum zones): buildings in a state of overcrowding and decay are referred as *tugurios* (slum tenements). The official term, accepted by the residents, is *solares* (tenements), rather than *tugurios*. The first planning documents on these areas use, however, the term *tugurio*, and that is how they are known to the public at large. *Tugurios*, however, are, in many cases, relevant evidence of a unique Viceroyal architectural legacy.

1.2 The Architectural Heritage of Lima: Typological and Functional Characteristics, Conservation versus Improper Use (Patrizia MONTUORI)

The Historic Center of Lima is a complex and precious palimpsest of structures, buildings and spaces dating from pre-Hispanic, Viceroyal and Republican period, characterized by a rich architectural, constructive and typological diversity.

Lima's architectural heritage is a huge showcase of original architectural and constructive solutions, thanks to the fusion of European and pre-Hispanic influences, which have produced an original architectural language and unique construction techniques.

This complexity and richness need adequate instruments for studying, analyzing and cataloging not only architectural heritage's construction and materials issues but also peculiar typological and functional characteristics.

One of the most interesting and complex aspects in Historic Center of Lima is, in fact, the one regarding original typologies and functions of historic buildings and their later transformations.

In the modern era many residential buildings, and, more marginally, public and religious buildings, have undergone an overturn of its typological and functional characteristics.

Even today, the Historic Center of Lima is mainly characterized by the presence of traditional "courtyard houses" dating from Viceroyal and Republican period, which was originally a single-family typology. The "courtyard house" was the basic cell of Viceroyal urban fabric, which was organized according to an urban Hippodamian layout, formed by orthogonal grid.

The "courtyard houses", thanks to the semi-private courtyards open on the streets, created, in center of Lima, an urban space similar to the one existing in southern Europe, North Africa and the Middle East ancient cities. Most probably, other types of residential housing complexes, present in Lima since its foundation, may come from same cultural areas.

However, unlike the "courtyard houses", these complexes were destined to medium-low income social classes and were located next to manufacturing establishments, where the inhabitants worked, or in peripheral urban areas.

The *callejón* was a complex characterized by small houses with one level, consisting of one room and a courtyard, arranged one beside the other and accessed by semi-private alleys with little shrines for saints, with squares, with small chapels where the inhabitants met. Instead the *quinta* was a type of collective housing usually consists of apartments, arranged next to each other, directly accessible from the street or, more rarely, by a semi-private alley. The *quinta* was initially with a single level, but as a result of demographic growth of the city, it has been added a second level to already existing complexes and it started to be built new complexes directly with two floors, with galleries of access and distribution.

By the mid-twentieth century the movement of the middle class from the area of Lima founded in Viceroyal period to the new quarters of expansion has significant effects on both the center and the historic buildings of Lima, in particular those for residential use.

On the one hand the ancient single-family residences of Viceroyal and Republican period were occupied by several families, usually without financial resources. The buildings are in a serious state of disrepair and have undergone improper transformations, even for the modest economic conditions of the inhabitants to operate maintenance, conservation and functional and sanitation upgrading. Also the residential housing complexes, typologically more adequate to accommodate several families are also in a precarious state of conservation for the lack of maintenance due to the limited resources of the inhabitants.

On the other hand, the center has lost managerial functions, that have moved in the south of the city, due to the drastic reduction of the social level of the inhabitants, and is progressively characterized as a place of itinerant trade, legal and illegal: the flourish of the commercial activities caused the improper transformation of many buildings, including historic, in small firms or shops; the stalls of street vendors occupy the sidewalks of center and occlude the view of the historic buildings, streets and squares, often causing considerable damage to the facades [4].

Some cases of commercial re-use and irreversible alteration of artifacts of historic center are emblematic such as the house of Manuel Ricardo Palma Soriano, well-known Peruvian essayist and writer from the mid-1800s. The house was built probably during the era of the Viceroyalty and remodeled during the Republican period, was designated a National

Monument in 1989. Today only the wing facing the street, with its typical wooden balcony, is partially preserved, but parts of the building have been demolished around the interior courtyard, and a small informal market and stalls have been built.

Many buildings of historical and architectural value are intentionally destroyed, partially or totally, for creating parking, commercial activities or for building new edifices: significant is the recent collapse of El Buque building, caused by a fire, possibly arson. The building dates back to the eighteenth century and was the only three-story building in the area of Barrios Altos: the ground floor was built of *adobe*, while the upper levels were made of *quincha*. It appears to have been initially a spacious courtyard house, later becoming an apartment complex with a balcony running along the exterior of the third level that provided access to the small apartments.

Since 1991, and particularly after the proclamation of the historical center of Lima "World Heritage", the government has tried to chase away the street vendors from the center with regulations, plans, and even with the police and tear gas. However, the opposition to such measures has been very strong, and the results are quite disappointing.

In fact it is important to understand that today Lima's historic center of, like others, especially in Latin America, is characterized not only for the artifacts and urban areas of historical and architectural value: the viability induced by the numerous inhabitants and by the widespread dissemination of commercial activities, on the one hand causes the problems mentioned but on the other hand is now an integral part of its image and of its social and economic structure.

So organic and effective re-qualification policies of the Historic Center can be processed only through a complex and multi-level analysis of historical, architectural, functional, economic and social aspects, which helps to understand how to regulate and integrate different needs and goals.

Fig.1-2: *Casona* El Buque before and after the collapse. In November 2012, a fire caused the collapse of this historic mansion built in 1753 and designated national monument in 1988.

2 From Cultural Heritage Survey to Development of a GIS Database for Safeguarding and Revitalizing the Historic Center of Lima

2.1 A Documentation Form for Surveying the Architectural Heritage of Lima (Angela LOMBARDI)

The Historic Center of Lima is a rich ensemble of historic buildings, archaeological remains and urban spaces with high architectural and historical significance, the area is therefore characterized by such extremely problematic social, economic and functional conditions that any form of architectural heritage conservation is extremely hard to be undertaken.

For these reasons, during the research developed in 2012 by SAPIENZA University of Rome in collaboration with the National University of Engineering of Lima and the World Monuments Fund, has become apparent the necessity of gathering and coordinating extremely diverse data related to the relevant features of the Historic Center of Lima, not only focusing on historic structure but also involving its context.

A preliminary survey of the city's architectural heritage has been implemented through the creation of a survey form, which revealed to be the most effective and flexible tool for gathering and processing relevant data and make them comparable [7].

The analysis is carried out on two different levels: the first focuses on the structure itself, identifying the layering's, transformations, construction systems and state of conservation of the buildings; while the second level examines its relationship with the city and the similarities that enable diverse elements within urban space to co-exist, change, integrate and replace each other over time.

The documentation forms represent an investigative tool preliminary to a rehabilitation program for each single building and its spatial context, aimed at "re-qualifying" its specific components, related to both the local and general urban context. The acquired data have been methodically subdivided into seven separate sections, each designed to classify the information into groups of options or *tables* containing the required data.

The first section of the form deals with STRUCTURE TYPE: Four recurring types have been identified: monument, building, neighborhood and, archaeological remains.

The first two definitions refer not only to the *Charter of Venice* of 1964, but also to the *UNESCO Recommendations* of 1972 which underline the extension of the heritage concept from single monuments to "vernacular buildings which have acquired a special significance with the passage of time" (Art.5). However, the presence of archaeological remains in an urban settlement needs to be documented and will lead to an evaluation of its archaeological potential, to be synthesized in a "Charter of Archaeological Potentials", tool never taken into consideration by Lima's city planners.

The second section considers the structure in its CONTEXT and refers to the Charter of Venice of 1964, which recognizes the need to preserve not only the "single architectural work", but also the "urban or rural setting" formed by the vernacular built fabric. The second section requires the description of the buildings' location and adjacent urban fabric, documenting the relationship between heritage buildings, new architecture and the more general cityscape.

The third and fourth section contains HISTORICAL DATA and DESCRIPTION, including information on construction period, original and current uses. Defining the original and actual uses of a structure under analysis requires a complex cultural background and involves not only typological studies, considered part of the historical and archaeological disciplines, but also social study, analysis and demographic data connected with each single structure.

The fifth section is an analysis of BUILDING TECHNIQUES AND DETAILS characterizing the object, it collects relevant information of the significance of the structure, its layering and its construction technique. Significance (singular features) describes the qualities that distinguish the structure and render it culturally significant. In the form four categories have been identified: 1) typological, 2) technical and construction-related, 3) historical and, 4) artistic. This section is critical, being able to document, although in a synthetic way, the physical features of Lima's architectural heritage.

Understanding these characteristics is indispensable to develop a program of intervention as it has a direct bearing on the future utilization of the cultural heritage and the modalities to be adopted for its rehabilitation.

No such analytical and scientific oriented documentation has been undertaken until our study.

Section six of the form looks at the LEVEL OF RISK, i.e. the problems related to the conservation of the structure, through an analytical matrix combining two significant variables, the most important for Lima's architectural heritage assessment, the "level of usability" and the "level of conservation".

The level of risk is the result of a possible combination of the two variables above mentioned and is evidenced in a table showing five possible levels: 1) very high risk requiring immediate intervention; 2) high risk requiring interventions aimed at redressing the damage; 3) medium level risk requiring interventions aimed at mitigating the damage; 4) low level risk requiring further analyses and investigations; 5) no risk and no need for controls, analytical investigations or upgrading of the hygienic and utility standards.

The survey form's seventh section collects information about OWNERSHIP AND PRESERVATION instruments, examining the relevant preservation decrees, the actors and beneficiaries of the rehabilitation process, the source of restoration/conservation/rehabilitation funds and the existing legal instruments, both at national and international levels, that may have a bearing on the building in question.

The form will have to indicate a) if the building falls within the area of the historic center of Lima, declared by UNESCO in 1991 a World Heritage Site, citing the norms applicable; 2) if it is a national monument of historic and artistic interest, mentioning any binding legal instruments; 3) if any relevant town planning laws are applicable in the case of vernacular buildings; 4) if other legal preservation instruments or actions are in place which may be supported by private associations or institutions. The ownership status has to specify, whether public, private or religious, and, where applicable, indicates the existence of expropriation decrees. It should be noted that, based on the available statistical data, ownership titles are often impossible to trace.

During the 2012 study, with the use of the above described documentation form, have been undertaken survey and documentation of numerous buildings and sites, particularly representative for their historical- architectural- constructive- typological features.

Next objective is to extend and implement the survey during the following research phases and make accessible and immediately usable the collected data [7].

2.2 A GIS Database for the Architectural Heritage of Lima: Characteristics and Potentials for Analysis, Monitoring and Interventions in the Historic Center (Patrizia MONTUORI)

The analysis of spatial information is not a new concept. Over the past centuries mathematicians, geographers, cartographers have started to analyze spatial relationships through paper cartographic bases and thematic overlapped lucid, which can be considered a sort of first analogical GIS.

As is well known the G.I.S. (Geographic Information System) is a software tool that consists of a set of functions used to analyze the spatial properties and potential relationships between objects and events. In fact the GIS technology combines the mechanisms and operations of common database with the geographic analysis and the ability to display on the map. This single information system is a valuable tool to analyze the events and planning strategies since all the information available, from micro to macro scale are always readily accessible.

In fact, through the interrogation of the designed and built database today you can easily manage and implement all archived data; build in real time information plans based on queries made; formulate new questions based on the answers obtained; build interpretative hypotheses and predictions of intervention. The GIS systems are related to other database applications, but with the important difference that all the entered information are united by spatial references, since the geo-referencing is the main criterion for storage and management of information.

So the GIS, with its set of functions are a real methodology for placing, storage and analysis of data that can be used for a specific search and / or to plan and make decisions.

It is a tool for monitoring and analysis that can be very useful for the evaluation and planning of interventions in historic centers, where usually add up complex and very different problems: the protection of historical and architectural values, the conservation needs, the functional needs, the socio-economic conditions.

The Historic Center of Lima is certainly emblematic in this sense because it is characterized by socio-economic, functional and conservative conditions very problematic. The survey developed in 2012 as part of the study conducted by SAPIENZA University of Rome in collaboration with the National University of Engineering of Lima and the World Monuments Fund [7], was elaborated in order to collect not only historic, artistic, construction related, typological and conservation-related data but also social, economic and functional information.

As part of this project on the Historic Center of Lima is now planning to start the next phase of research in which the collected data will be entered into a geo-referred database to be proposed as a "pilot project" to organizations and local authorities.

The aim is to provide a new tool to Lima's municipality, today not existent, not only for documentation and research but also for the management and planning for the conservation, revitalization and development of the Historic Center. With the support of Lima's architectural heritage geo-referred database, for example, you could more simply set up a program of "planned conservation" for buildings of historical and architectural value.

In fact, the increasing database that could be created would allow monitoring the state of degradation, identifying main causes (both physical and functional, social or economic), to evaluate the conservation procedures and to plan maintenance interventions of the artifacts, like in a "risk map".

In fact, in a database GIS the value of information on a building increases with the number of buildings managed with the same criteria of documentation. So its quality and potential are evident when you need to check and compare different data such as, for example, the incidence of the different factors in the processes of degradation of historical buildings; the effectiveness of the materials and techniques used in the restoration and maintenance; the verification of the costs of conservation and maintenance. Particularly useful in the case of Lima is the possibility offered by the GIS system of cross and compare with immediacy and simplicity the data on the original characteristics of the buildings (typological, historical, architectural and construction); on the state of conservation and interventions already made; on the current functional use of buildings and areas; on the number, class and economic conditions of the inhabitants. In fact, this allows not only to identify the interventions most effective for the physical preservation of the artifacts but also to plan broader strategies for the rehabilitation and development of the center.

With a GIS database would be easier to establish guidelines for the conservation and development of the historical center of Lima which are sustainable in terms of historic and architectural as well as functional, social and economic and previously verify its effectiveness. It could be an excellent tool to support both the management and planning of conservation interventions both of architectural design and urban planning.

In fact, thanks to its versatility this application lends itself to be customized according to the specific needs and the problems to investigate and develop from time to time. To understand the infinite possibilities that this instrument may have in the conservation and development of the Historic Center of Lima, as in other cities, we can say that thanks to GIS the knowledge of an object, always partial and provisional, could be part of a complex system, always fully available, queryable, comparable, reinterpretable and implemented. An instrument that, in other words, could help to manage the complexity of the historical center of Lima through chance of informative associations so far unimaginable, that may guide future choices of conservation, transformation and development, today mostly fragmented and disorganized.

Memories in stone

Ornella ZERLENGA

Department of Architecture and Industrial Design, Second University of Naples, Aversa, Italy.
ornella.zerlenga@unina2.it

Abstract

Most of the portals and stairways of historical Neapolitan buildings were made of stone, often, a dark stone, known as piperno. In general, the year of construction as well as the designer of the portal or stairway is known only for those buildings of considerable historical and architectural importance. It is possible to attribute to architects such as Bartolomeo Picchiatti, Cosimo Fanzago, Ferdinando Sanfelice and Ferdinando Fuga several huge portals and stairways, while in most cases only the century of manufacture can be identified, with the work being accredited to local craftsmen (often Fanzaghiana or Sanfeliciano). These “stone memories” are therefore an epochal expression of culture, with the art of *lapidum incisores* being a cultured and refined testimony of a craft tradition that binds a multiple formal inventiveness to a constructive use and treatment of stone. The knowledge project of typical and atypical examples highlights the variety of inventive designs as well as skillful ability to adapt to the shape and structure of the stones. Simultaneously, an architectural survey of the portals and stairways as well as a modelling and subsequent rapid prototyping will make it possible to intervene on degraded stone elements.

Keywords: Neapolitan historic buildings, portals, stereotomy, tourist guides, architectural survey.

1. The portals of the historic buildings of Naples

The complex entrances of residential buildings – consisting of the portal, entrance hall, courtyard, stairs – characterize most of the historic buildings in the city of Naples. In general, since the portal is an attractive element, it catches the passer-by's attention due to its shape, size, material, decoration, as well as its function – to allow the transition from an external to internal space – which ever since ancient times has been recognized as being full of symbolic meaning. Functionally, the portal, as well as the door, represent an opening. An opening, which allows the passage from one environment to another. On an ideological level, this symbolic function originated in ancient Rome with the triumphal arch, a monumental building designed to be a symbolic gate of victory, with a celebratory nature and, therefore, along the street where the triumphal processions took place and under which the commander marched with the spoils of war, treasure and slaves.

Over the centuries, the portal has maintained the symbolic value of ‘passage’, to the point that its pictorial representation has been used as a metaphor in the title pages of several treatises to allude to the entering of the reader into the world of knowledge, as well as in numerous copies of treatises on geometry and military art dating from the XVI-XVII centuries (Fig. 1).

In this sense and specifically in the historic buildings in Naples, the portal is the first link in a continuous sequence of space (hall, courtyard, staircase) placed to mark the site of the transition from a public space (the street) to a private one (the building). Whether it is minor or noble architecture, the portal is a means of celebration and symbolic representation that, by virtue of size, shape, material and decoration, invades the street calling the attention of the passers-by. Even today, despite numerous attacks, this spatial system continues to play a prominent role in mediating the relationship between the space of the roadside and that inside the building, surpassing the eloquence of the road in establishing itself as a kind of filter or diaphragm. In close connection with the road, the plastic and figurative space of the portal and the wise scanning light-darkness-light (which connotes the sequence road-entrance hall-courtyard) attract the passer-by whose gaze, having passed the entrance hall, runs

into an enclosed, cosy and intimate space, the courtyard. An open space, that is pleasantly perceived – as shown by the majority of Neapolitan buildings – with a stairway, that according to the local tradition, is an ‘open staircase’, often located in front of the main entrance, with the specific aim of visually seducing the passers-by (going along the street) thanks to the force of a spatial dynamism generated by the changing movement of the buttresses and a plurality of vaulted structures, that are typologically different and variously articulated. In several cases, behind the stairway, there is a garden, with the whole being transformed into a multidimensional perceptual context, consisting of multiple spatial forms, colours, sounds, smells, of which the portal is the mediator [1], which include the “gullwing” stairway by Ferdinando Sanfelice in the neighbourhoods of Vergini and Sanità in Naples.

The portals that characterize the housing of the historical buildings in Naples (in the neighbourhoods of Vergini, Sanità, Avvocata, and Montecalvario) have been the subject of cataloging by the writer on behalf of the Office for the Environmental and Architectural Heritage of Naples and province between 1992 and 1993. In 1995, during the “XI edition of Cultural Heritage Week”, the Office for the Environmental and Architectural Heritage of Naples and province organized the first exhibition on the “Portals of Naples” along the Spaccanapoli, of which the writer dealt with graphic design of the tables included in this show. The model adopted for cataloging the portals corresponds to the table “A” (Architecture), whose compilation as indicated by the Central Institute for Cataloguing and Documentation in the rules for drawing up (1974 and subsequent updates), is aimed at data collection as well as graphic and photographic documentation of individual buildings or architectural structures not related to only emergencies but can also be used for smaller sized objects [2].

2. The configuration and morphology of the portal: elements and forms

The portals of the Neapolitan historic buildings are characterized by a wide variety of *exempla*. During the academic years from 1987 to 1991 during the course “Design and Survey” by Professor Rosa Penta (Faculty of Architecture of the University of Naples “Federico II”), with the scientific and didactic collaboration of the writer, a study of the architectural stone portals of the Neapolitan historic buildings (scale 1:10 or 1:20, and all relevant details and figurative designs in the scale of 1:5, 1:2, 1:1) was carried out. The graphic documentation included the design of portals, porches and stairways of one hundred and fifty residential buildings in the historic centre of Naples, and is both considerable historical and architectural as well as minor fabric value. The scientific survey and graphic documentation of the portals, albeit in an apparent reduction of the metric scale, has restored a frontal view of the same section that is often prevented from the narrow road [3].

From a structural point of view, these are grouped into two construction systems: an architrave and archivolted, with the later having more declinations in virtue of the variability of the profile of the arch. In the Neapolitan context, the recurrent categories of archivolt portal use curvilinear profiles (mainly, the circular type or low arches, as well as oval), mixtilinear (including polycentric to concave-convex sanfelician type) and straight.

In addition to the construction system, the main elements that characterize the design of the portal are the frame, entablature, pediment, shelves, and architectural order.

In general, the frame highlights the gap. It may be unique or stand out in more bands with an internal and external movement with respect to the archway (often treated with different motifs and interrupted by the door, in key and by the socket) or present a prolonged architrave with either a frieze or ‘pulvino’. From an ornamental perspective, the frame can use as well as make up elements of classical moulding (strip, astragalus, bull, straight and reverse parallels, ‘echino’, ‘ovolo’, ‘cavetto’, ‘scozia’, rod) as well as be decorated with carvings (floral or geometric patterns in relief or bas-relief) or appear indented, presenting – in this case – an ashlar movement in relation to the blocks in which several blocks are highlighted in a significant position such as the doorway and keystone. In the case of an embossed frame, this may be limited to a simple indentation of the lines of junction between the blocks (smooth ashlar or ‘gentle’) or propose ‘cushioned’ bosses (rounded edges) or ‘diamond point’ (prismatic), or admitting a treatment of the stone block, crudely roughed or tapped. In addition, the plastic-perceptual variability of the dimpled frame is also given by the different treatment of the whole (sharp-edged, rounded, etc.). Finally, there are various cases in which the portal frame has an alternating rhythm in the plastic treatment of the abutments (typically, by interchanging moulded and flat strips) or in the use of different materials (usually, ‘piperno’ and white marble to give a distinctive two-tone effect).

The entablature, a horizontal frame supported by piers, may be part of the crowning element of the portal (often under a panel, which in turn is placed above the frame) or can be surmounted by a pediment. Typically, in Neapolitan portals, the pediment may either jut out from the edge of the entablature or have the central part of the entablature missing, so as to show the slopes of the everted pediment (i.e., broken and pushed forward), which is why it is often also associated with the entablature. In some cases, the apex of the pediment placed in a recessed position is omitted, with this solution not infrequently being associated with the stretch of the entablature below. The pediment

- 6 – Palazzo del Duca di Limatola Gammacorta (in PETRINI, Paolo. *Facciate ...*).
- 7 – JOLI, Antonio. *Strada di Santa Maria di Costantinopoli*. Napoli: 1756-59.

is generally triangular in shape, but in the Neapolitan context, it is commonly curved, i.e. 'tilted', and has the same height as a triangular one (presenting similar declinations), or has a semi-circular profile. In baroque and rococo types, there are several different curves, such as the sloping curved curl (together or separately), polycentric to concave-convex or mixtilinear. In addition, in some cases, the broken pediment includes windows, statues or emblems (symbolic or decorative busts and sculptures).

Another significant element of the design of the portal is the ornamental shelf, with it being a support structure in horizontal projection which can be placed flat against the wall or in profile. The shelf is usually placed at the top corners of the opening or holding the entablature and the pediment. There are various shapes, depending on whether they are shelves with elements linked to the architectural order (mutulo) or scroll or volute shelves (with multiple ribs, crumpled roll or spiral shaped around an eye).

In the portals of the Neapolitan historical buildings, it is quite common for the composition of the elements to be related to the order architectural. However, there are several examples in which the columns are either totally absent or semi-columns in front of pilasters as well as some of the motifs of the portal being different those conforming to the order. In fact, the capitals are configured both in accordance with the architectural canon as well as plant, animals, anthropomorphic or allegorical motifs. In other episodes, however, some elements may conflict with each other (for example, the lintel of the portal with the entablature of the order).

In conclusion, the richness according to which these elements participating in the spatial configuration of the portal is remarkable, to which there is the further presence of curbstones, wooden doors, as well as iron or wooden fanlights. Similarly, there are few cases in which the score composition of the portal includes a greater number of floors, with a window or a balcony (with doors) being located above the entablature, thus returning a spatial solution that, reinforced by the shoulder and pediment, gives the portal as the protagonist of the urban scene by virtue of a search for plastic effects capable of configuring it as a powerful and privileged presence, with majesty and splendour that characterizes it as *unicum* in the design of the facade.

3. The design of the stone portal: the stereotomy of stone

Most of the portals of the Neapolitan historic buildings are made of 'piperno', including a rock stone that incorporates dark lenticular, with the whole presenting dark compact 'litoide' features with 'flames' of various sizes. It is well known that this stone has been mined in the quarries of the neighbourhoods of Soccavo and Pianura since the thirteenth century, precisely in 'Vallone del Verdolino' and 'Masseria del Monte'. The latter is recognizable today by the entrance located at the foot of the 'Collina dei Camaldoli' in Via dei Monti Vicinale and was recently the subject of multiple studies and surveys [4].

In general, the year of construction and designer of the portal are known only for buildings of historical and architectural importance. In fact, the information about several important great Neapolitan portals is known, with them being attributed to excellent architects such as Bartolomeo Picchiatti (palazzo Sansevero di Sangro), Cosimo Fanzago (Zevallos di Stigliano, Firrao and Carafa di Maddaloni), Ferdinando Sanfelice (Pignatelli di Monteleone e Filomarino), Ferdinando Fuga (Cellamare). While in most cases, only the century can be distinguished, with the work being attributed to local craftsmen (often fanzaghian or sanfelician), whose art of *lapidum incisores* – expression of their culture – amply testifies a tradition of craftsmanship that combines a multiple formal inventiveness and ability to skilfully use and constructive treatment of stone. Traditional methods based on the integration of the extracting and processing of stone, which correspond to two main stages: the first, by the 'tagliamonti', which, after extracting the piperno from the quarry, proceed to cut it into blocks that are more or less the size of the final element so as to be able to transport them to the worksite, where the 'pipernieri' carry out the second phase with the outlining, profiling and implementing the final abutments.

The work of the stonemasons was a fundamental prerequisite for the development of a peculiar science, that of cutting stones, a significant branch of architecture called 'stereotomy' – from the Greek, 'solid' and 'section' – which was given its name by Jacques Curabelle, author in 1644 of a work entitled *Examen des oeuvres du S^R Girard Desargues par J. Curabelle* [5]. Stereotomy is therefore a complex science, highly integrated by multiple operational and theoretical knowledge including knowledge of mathematics and geometry (the theory of surfaces and their intersections) of materials and their static behaviour, as well as practical and technical construction and shipbuilding management in the working of the equipment. Above all, stereotomy is the learning of a wealth of scientific knowledge that allows for the production of pieces off site, and then placing them on site as elements 'pre-fabricated' according to a precise plan based on the geometric configurative-morphological control of the architectural whole as well as of the parts that compose it. The study of stereotomy is thus a considerable and fundamental support in the cognitive assumption of what is happening today through digital technologies. In fact, similar to the standardization process operated through stereotomy, modern technological innovation makes it possible to obtain through the acquisition of three-dimensional digital models of mouldings and stone blocks of the portals prototypes

Fig. 3: The design of the stone portals: tourist guides and current architectural survey.

(three-dimensional plastic model) to subsequently carry out with the same stone materials belonging to local traditions to replace any damaged 'pieces' [6].

Stereotomic knowledge was first made public in the sixteenth century, when scientific culture was mature enough to consider the idea of the project as a privileged place of theoretical speculation and operational verification and, at the same time, the practice of geometrical drawing in orthogonal projection (plant and raised) as a vehicle for control of the entire design process from intuition to realization on site. Stereotomy became a science, with its theoretical and practical basis dedicated to the principles of cutting stones being spread through the press in the face of centuries of secrecy by the medieval guilds. The publication in Paris in 1567, of the *Traité d'Architecture* by Philibert de l'Orme marks the end of this fundamental shift, followed during the seventeenth and eighteenth centuries by a remarkable amount of treatises on the subject (not only French) as well as theoretical studies on surfaces and curves, including those with a double curvature (i.e., oblique surfaces), the knowledge of which assumes a fundamental importance to the stereotomic project up to the Treaty by Amédée François Frézier significantly entitled *La Théorie et la Pratique de la Coupe des Pierres et des Bois, pour la Construction de Voutes et autre Parties des Bâtimens Civils & Militaires, ou Traité de Stereotomie a l'Usage de l'Architecture* (Parigi, 1737-1739), in which all the knowledge on the latest stone cutting and surface intersections is contained, allowing for the project management of increasingly complex forms of space as well as the construction of more innovative equipment [7].

From the perspective of the stereotomic project, works in cut stone are constituted by blocks or wedges and their assembly is determined by a careful control outside of the work of the geometric behaviour of the facing surfaces (visible) and the junction between the abutments (not visible). This results in the stereotomic project having to respond to the best identification and installation of the equipment or the combination of surfaces of the junction between the ashlar preferably plane, preferring, in the case that the joining surfaces are curved, the use of a particular type of surfaces, grooved, since being generated by the movement of a straight line in space, this geometrical condition can be easily reproduced by *lapidum incisores*.

Based on these considerations, the design of the stone portal should distinguish the apparatus of the abutments from those of the arch (or lintel). Specifically, the apparatus of the ashlar of the abutments can be approximated to that of a masonry plane, considering surfaces facing flat to vertical progression (or sheer) with joining flat surfaces. Generally, the ashlar are parallelepiped in shape (or prismatic with inclined fronts in relation to the facade of the building). From an ornamental point of view, they are variously shaped (strips, clews, etc.), almost always the same size (unless there is a rhythmic pattern of ashlar) and arranged to form layers by the continuous horizontal joints. The apparatus of the ashlar of the arc (circular, depressed, continuous or discontinuous polycentric) can be approximated to a straight cylindrical arc, sharing the odd number of blocks and the structural presence of a keystone. Even in this case the joining surfaces are flat and, if the arc is circular, they belong to radial planes passing through the centre of the arc.

Within the context of the Neapolitan historic buildings, there seems to be a widespread use, with numerous excellent examples (for example, the portal of the building by Carafa della Spina) of more modest sized portals, as well as the formal-structural type in which the straight side is constituted by a single ashlar, while the arc by only three elements of which one is the keystone.

4. The design of the stone portals: tourist guides

At the end of the seventeenth century, there was a renewed publishing project dealing with the type of tourist guides in Naples, which saw the introduction of accurate illustrations of specific parts of the city in the form of 'views'. In a sense, it can be said that the production of these views interfaces with a new way of understanding the tourist guide that, relying more and more on the drafting of an organically illustrative tool in accordance with the written text, justifies the frequent use to document architecture and places through figurative representations capable of better conveying the architectural and environmental values, due to faster visual communication of those salient features described in the text and brought to the attention of the reader through the references to the image represented. The result of this cultural innovation is the publication in Naples in less than thirty years of numerous city (or of the Kingdom) guides where, by virtue of a consolidated opinion, the graphic image is entrusted with the central role of transmitting knowledge of the city and its main sites [8].

Among the guides of Naples that give images of places (streets and squares) as seen on an urban scale, according to Giancarlo Alasio Domenico the one by Antonio Parrino entitled *Napoli città nobilissima, antica e fedelissima esposta agli occhi, e alla mente de' Curiosi ...*, published in Naples in 1700, is «the first Neapolitan guide that has an extensive illustration program in line with the text» [9]. In this guide, many of the most famous streets of Naples (represented according to a general plan in accidental perspective) depict the building contexts and make it possible to see the main morphological features of special interest, such as scores on the facade and the main ornamental apparatus of windows and doorways. Additionally, in describing the beauties of the city, Parrino also indicates its building materials, commenting: «the mountains that crown it, provide some of the sweet

and light stone, which admirably combines with the lime giving the opportunity to raise tall buildings, and these sometimes up to a fifth or sixth apartment, others give a hard and black stone, called Piperno, which is used for the arches of the doors and windows and to strengthen the foundations» [10].

The guide by Paolo Petrini, entitled *Facciate delli palazzi più cospicui della città di Napoli*, published in 1718 is also particularly interesting. It is on architectural scale and entirely dedicated to the graphic documentation of the main palaces of the city (these include Palazzo Sansevero, Corigliano, Casacalenda, Filomarino, Gravina, Carafa di Maddaloni, Ruffo di Bagnara, Firrao) [11]. The work is significant from several points of view: the geometric method of representation used (the buildings are shown in elevation, even though there is the allusion of a three-dimensional effect due to the perspective of the roof), the scale of representation (which approximates a ratio 1:100, 1:50); the clarity and precision of the section; the abundance of detail and figurative elements represented including the design of the portal that, in these representations, is the core attraction of the composition and that, at the same time, as shown without doors makes it possible to explore the features of the building behind the façade, penetrating through the archway into the courtyard, in turn built prospectively almost simulating the perceptual experience of a dynamic view captured at the altitude of the road (Fig. 2).

About fifty years later (1767), a new publication edited by Etienne Giraud entitled *Le grand golphe de Naples* integrate the panoramic system of Parrino with the precision for figurative detail of Petrini, resulting highly aberrated roadsides in which the main palaces of Naples and their portals are represented.

The iconography that accompanies *Guida dè forestieri, curiosi di vedere e d'intendere le cose più notabili della regal città di Napoli e del suo amenissimo distretto*, edited by Abbot Pompeo Sarnelli and published in Naples in 1685 by the publisher Antonio Bulifon, is to architectural detail scale. It contains multiple recordings, including that of the portal of Palazzo Maddaloni represented in a front view (here compared to a current survey: Fig. 3). Using the application of shading techniques, the design of the portal (fitted with a wide caption: «Caval.^o Cosmo Invent. Cap.ⁿ Ingegn.^o Sebast. Indilicato lineavit/P. Del Sig.^r Duca di Maddaloni. Fol. 365 / All'Ecc.^{mo} Sig.^{re} / Il Sig.^r D. Dom.^{co} Marzio Carafa Pacecco, Duca di Maddaloni ecc., Cavalier del Tosone. Quell'unghia delineata da Fidia, al riferir di Plutarco, valse per indice d'un gran Leone. Questo vestibolo, che ho qui fatto incidere è indizio della magnificenza del suo Palagio. Le cose grandi appariscono anche dalle vestigia, ed à V. E. profondam.^{te} m'inchino. Antonio Bulifon», ivi, Tav. XLII, pp. 364-365. [12]) emphasizes the plastic value of the layout and directs the reader's attention to both the size of the portal (whose spatial solution includes more floors) as well as the presence of ashlar (which protrude from the plane of the frame), while the fornix becomes an opportunity to visually exceed the limit of the road and enter the private space of the yard where two fronts are outlined in perspective. It is no coincidence that in the caption attached to engraving and signed by of Antonio Bulifon, there is: «This hall, which I had engraved here is an indication of the magnificence of his Palace».

However, there are few iconographic authoritative sources documenting the project design of the portal, such as the case of the sketch of the portal of Palazzo Pignatelli di Monteleone by Ferdinando Sanfelice who with noteworthy graphic performance and detailed representation scale describes the front view (prospect); the drawing is housed in the 'Museo di Capodimonte di Napoli' [13]. The project represented in great detail does not entirely correspond to the final realised version (here the original design, photos, and actual portal are compared in Fig. 4), with the entire curved pediment missing and only the entablature of completion (surmounted by a balcony with a glass door) present, as well as a larger title block than that present, covering the entire keystone of the arch, in contrast perfectly visible in the variant made.

In conclusion, the examples cited show how through the design and masterful use of representation methods and techniques, these illustrations drawn in various graphic scales have not only been able to describe a product of local culture and art lacipida in working piperno, but also to evoke the main role of the portal, always using the symbolic representation and transition from public to private (Translated by Sacha A. Berardo).

Eminent De[con]struction: Conservation Acts of Modern Vandals within Built Forms, Landscapes and Cities

Catharine PYENSON

Taubman College of Architecture and Urban Planning at the University of Michigan, Ann Arbor,
Michigan, United States of America

catharine.pyenson@gmail.com

Abstract

This paper proposes that works created through methods of vandalism offer absence, elimination, and destruction as a means of conservation. Over the last century, conservation practices have focused on various reparative and additive qualities in order to sustain histories and objects of the past. The incisions made by artist Gordon Matta-Clark on built forms in the US and Paris, the ground-breaking landscape interventions of Gilles Clément in South America and Europe, and the city alterations and destructive natures of “master builder” Robert Moses in New York all propose conservation as not the glossing or patching over of the past’s deterioration and decay, but rather as a celebration of befallen modes of existence.

The following paper will explore the cuts, holes, voids, and general editing of structures, landscapes and cities in the context of constructing a memory and history. The means and craft by which the designers have orchestrated their interventions, intersecting laws and conventions of practice, broaden the narrow range of conservation and give the practice a severity and intent, a focus currently lacking in the contemporary discipline. By analyzing the inverse of spatial constructs, a new means of preservation will emerge.

Keywords: Conservation, Destruction, Vandalism, Un-making

1. Introduction

Conservation efforts frequently seek to conceal scars of the past. There is a tendency to polish, clean-up and improve upon objects in demise; remedying, resolving, or even curing the “problems” of deterioration and ruin. Modern conservation practices focus on various reparative and additive qualities in order to sustain histories and objects of the past. A patching-over becomes a means to increase and extend longevity of an object – a catalyst that sets a never-ending cycle in motion where an object endures constant scrutiny to combat future stages of demise. Projects like the city of New York’s High Line attempted to salvage the more wild and unrefined moments of the natural and pre-existing conditions. However, this project still seems to exhibit a degree of reparation, a fixing of what existed before – as if the wild and uncontrolled conditions of the abandoned freight rail line were insufficient. Graffiti was removed, the wild flowers tamed; the park was museumified and made sterile both by its designers and users. The High Line had been transformed into a scene where super model and celebrity sightings became part of the visit, instead of functioning as a landscape of escape from the Disneyfied city around it. The notion of un-making the landscape along the West Side of the city was not an option, though the following pages contend that the process of un-making can be viewed as an act of conservation in its own right. To visually represent this duality of interpretation, I have modified the Hong Kong and Shanghai Banking Corporation advertisements (an ad campaign running under the slogan, “your point of view”), demonstrating different interpretations of the same object.[1]

Conservation needs of an alternative practice where the remnants of the past are not concealed but rather celebrated in their unaltered shape. If architecture can generate form based on undone-ness or the void, why cannot the practice of conservation? This paper proposes that works created through methods of un-building propose absence, elimination, and destruction as a means of conservation. Conservation efforts have become streamlined and too narrowly focused. Perhaps it is time to develop alternative methods in order to understand how to apply conservation to those sites or buildings where a patching-over is not only not appropriate, but also not possible (due to cost or regulation). The following pages examine conservation efforts at three different scales. First, small-scale interventions by the artist Gordon Matta-Clark on built forms, followed by the ground-breaking landscape exercises of Gilles Clément. Finally, there is a look toward the city alterations and destructive natures of “master builder” Robert Moses and his un-doing of New York’s urban fabric. I propose that these three figures are modern vandals who have created a new language of conservation.

Fig. 1: High Line, New York.

2. Gordon Matta-Clark and Built Form

Gordon Matta-Clark reveals quintessential space-making practices by his acts of un-making. He takes built forms slated for demolition and exercises acts of deconstruction: slicing, splitting, and cutting. The acts of un-doing in turn remake and recreate new ways to experience the spaces. He destroys space in order to reveal a void, a process best exemplified in his *Splitting: Four Corners* (1974). Here the artist made two parallel cuts down the center of an abandoned house in Englewood, New Jersey. Once having removed debris from the slice, he hoisted up the front portion of the house while setting the other half onto a lowered foundation. The resultant space, in-between the two halves, was a wedge-shaped void bisecting the structure. The four corners on the second floor were also removed and preserved as fragments. Matta-Clark submitted his works to a violent act of destruction and vandalism, and in doing so he also revealed the opposite of space, the void. By taking away, he added the opposite of space. The work is temporal - except for the photography, film, a few relics or corners saved, and the 1970s media buzz surrounding the work, the project has completely ceased to exist. This is contradictory to the very nature of built form and conservation practices, whose efforts are made to counter destruction.

Matta-Clark's later work, *Conical Intersect* (1975) in Paris, exercised similar efforts of un-doing in a project for the ninth Biennale de Paris. The site was composed of two buildings on the Plateau Beaubourg, near the historic marketplace, Les Halles, which had culminated in a *grand trou*, or large hole, after demolition. The buildings occupied by the *Conical Intersect* had little to no historical significance, though Matta-Clark argued their value came from the fact that they were among the few remaining structures standing in the wake of the colossal construction of Centre Georges Pompidou and general modernization of the Les Halles area. He carried out an act of “anarchitecture” where he and a small demolition crew inserted a void in the form of a twisting cone through the houses near the not-yet-completed Pompidou, intersecting walls and floors, and revealing a periscoping view, with a diameter base of 4-meter viewable at the street-level moving through the building and concluding with a 2-meter diameter view of the unfinished monument beyond. In exercising acts of demolition, he was recreating space of “an abandoned building full of luminous reflections.”[2] By inserting negative space, Matta-Clark brought light into a place where light would not have existed. Despite the seemingly violent act of destructions, there remains a beautifully delicate resultant. Once again, the work is temporal, the two-week process having been documented on 16 mm footage filmed by Matta-

Fig. 2: *Splitting: Four Corners* in Englewood, NJ (1974) and *Conical Intersect* in Paris (1975)

Clark and his two colleagues, Bruno Dewitt and Marc Petitjean. Shortly after its initial demolition (or insertion), the entire structure was destroyed.[3] The artist has managed to conserve by way of temporary destruction. He has referred to this process as "unbuilding" or "making space without building it." [4]

Fig. 3: Map showing Les Halles (left), the Centre Pompidou (right), and the *Conical Intersect* site (red square)

3. Gilles Clément and Landscape

Gilles Clément takes the notion of un-making and applies it to landscape design. He sees the *tiers paysage*, or third landscape, as space that is leftover. These underdeveloped plots, or fragments of land, are resultant spaces from demolition or rebuilding. They are the negative space, the anti-space, the untended to or fallow portions of land. Clément brings value to these predetermined value-less landscapes, claiming that they offer future opportunities.[5]

Clément's project La Vallée in the Reuse Valley in the Limousin region of France demonstrates aspects of the third landscape. The project refrained from working against the natural forces. Thus, he terms the resultant a *jardin basique* where plants are left to grow in a landscape that has remained untended to for nearly a decade. The gardener and garden are separate entities that don't interact save for the literal overseeing role assumed by the gardener; the gardener watches the *jardin en mouvement*. No plants are confined to beds, and no distinction is developed between weeds and

plants. The design of the landscape was not predetermined but rather allowed to organically unfurl. He writes:

How to maintain the landscape as a technocratic grid applied to the excesses of nature, to its violence? The total control project finds unexpected allies: radical ecologists and nostalgic people. Nothing has to change, our past is at the stake; or, nothing has to change, biodiversity is at stake. Everyone against vagrancy![6]

This anti-intervention-like approach is the opposite of the traditionally manicured sense of landscape design. In this way, Clément's relationship to the land is not so dissimilar to Matta-Clark's curation of space through building destruction. Both Clément and Matta-Clark are conserving works, while simultaneously redesigning them through acts of un-building and un-intervention.[7]

Fig. 4: Gilles Clément projects of un-making in France

4. Robert Moses and the City

Robert Moses is known as New York City's "master builder," often being compared to the French civic planner Baron Haussmann, attributed with Paris' Second Empire. Moses transformed the city, making sweeping moves and exercising eminent domain practices in order to introduce improved access to public transportation, like the famed New York Parkway network. Appointed as the first city-wide Commissioner of Parks in 1934, Moses' had over thirty years of influence over the city. In 1939, he opened the Shore Front Parkway, a 6-lane highway intended to link Brooklyn to the Hamptons, leaving partially destroyed homes, businesses and amusement parks in its wake (of note, Shore Front Parkway only ever went from Beach 73rd Street as far as Beach 108th Street, due to the National Park Service prohibiting roads and driving from Fire Island; the shortened Parkway assumed the title "Road to Nowhere" by the locals).[8]

A brief study of three houses along Shore Front Parkway showed that some homes remained that had been salvaged and essentially cut in half. For reasons not yet known, these houses managed to escape the call of eminent domain practices and survive as remnants of the city's past. Though not an artist, Moses has turned part of the cityscape into a canvas, making his own incisions so similar to Matta-Clarke. On the one hand, quite in opposition to the more passive responses to the land of Clément, on the other hand a counter reaction to the norm in the same vein. Moses is also preserving the city through a means of destruction. Though the cuts removed space, they ultimately preserved the city and linked the outer boroughs. Furthermore, Moses wanted to give commuters a shared view of the beach, water and landscape.

Fig. 5: “Half-house” along Shore Front Parkway in Queens, New York (left). The resultant irregular site plans, in red, of houses cut by the Parkway (west to east: 122 Beach 93rd Street, 119 Beach 92nd street and 105 Beach 90th Street) (right).

5. Conclusion

Cuts, holes, voids, and general editing of structures, landscapes and cities can work in favor of conservation practices. In a way, conservation by un-doing or un-building is the ultimate sustainable preservation exercise. Matta-Clark, Clément and even Moses understood the idea behind constructing space by taking away. The means and craft by which the designers of this paper orchestrated their interventions, intersecting laws and conventions of practice broaden the narrow range of conservation and give the practice a severity and intent, aspects currently lacking in the contemporary discipline. By analyzing the inverse of spatial constructs, a new means of preservation will emerge.

Fig. 6: Robert Moses and Gordon Matta-Clark as both preservationists and vandals.

Abstract

Roman underground cemeteries are an heritage to be safeguarded and enhanced. They constitute the memory of customs, traditions and rituals of a civilization. In Syracuse there are different catacombs complex (San Giovanni, Vigna Cassia and Santa Lucia). They are the most ancient document of Christianity in Sicily. Sometimes, plano-altimetric layout reuses existing hydraulic structures (aqueducts, private channels, cisterns) and earlier burial areas of the city.

The Aim of the research is the knowledge and the enhancement of the San Giovanni's catacomb complex through digital technologies for 3D data acquisition and virtual models that characterize and document its shape, size, geometry and materials. Moreover, digital enhancement project foresees the creation of a multimedia platform for archaeological complex guided tours and online ones.

That methodological approach required an interdisciplinary team composed by archaeologists, architects, engineers and experts in cultural communication.

Within digitization project our research team had to tackle wide-ranging issues and challenges: the sheer size of the complex, the intricate layout of the rooms and galleries, the surface irregularities, the bad lighting conditions, the significant amount of data to process and manage.

The scientific survey of the archaeological complex is the metric/spatial support that can be used to start innovative methods that allow you to create new scenarios for experimentation finalized to multi-disciplinary knowledge and enhancement of not easily accessible sites.

Keywords: Digital Heritage, Laser Scanning, 3D visualization, Catacombs, cultural landscape

1. Introduction

Cettina Santagati

Hypogeous Cultural Heritage represents an enormous and yet systematically and accurately unexplored heritage. The major part of European cities subsoil (for instance Rome, Naples, Prague, Nottingham, Paris) is rich of this kind of hidden cultural heritage. The knowledge and preservation of this heritage affects mainly urban archaeology research as well as the policies aimed at ensuring a safe and suitable use of our soils. The recurrent imprudent human actions and natural events make this heritage a very high risk and vulnerable patrimony. In case of collapse, it could constitute potentially a danger also for citizens' safety.

Furthermore, the difficulties related to the plano-altimetric complexity of the rooms (narrow and high galleries, irregular rooms) the lighting conditions (often poor) and the environmental conditions (ventilation, floodings, landslips, collapses) make these places difficult to access and document.

For all of these reasons this heritage remains largely not well-known, under-studied and poorly preserved.

The aim of this research is the knowledge and the enhancement of the catacomb of San Giovanni in Syracuse, according to a strategy that integrates latest technological developments in 3D data acquisition, analysis and communication of such archaeological landmark.

Effectively, digital technologies allow us to have 3D digital copies of the studied objects, a real clone, full of information where metric, perceptive and visual data can be integrated with interpretative data obtaining a 3D model whose potentialities can be exploited according to different declinations: from scientific documentation to archiving, to museum fruition and educational environment.

This methodological approach required an interdisciplinary team composed by archaeologists, architects, engineers and experts in cultural communication.

After giving an in-depth look into the issues related to 3D documentation and communication of Hypogeous Heritage in Section 2, Section 3 will give an overview of the historical and structural aspects of the Catacombs of San Giovanni. Section 4 will then focus on the digital enhancement and visitor experience. Section 5 will deal with actual surveying and 3D modelling methods used to create digital reproductions of some areas of the Catacombs. Section 6 will focus on texture mapping of the 3D model and Section 7 will examine the results of this study and consider future developments.

2. 3D documentation and communication of hypogeous cultural heritage

Cettina Santagati

Hypogeous sites are negative spaces generated by subtraction of matter where each element is at the same time structure, form, function and it is solidly connected to the surroundings. It is very difficult to understand this heritage in its structure and articulation because underground the visual contact with all the surroundings and with the external context is lost.

3D methodologies provide a visual, metric and spatial description of the studied object and can be considered a powerful and successful tool for knowing, documenting and conveying such complex cultural heritage almost hidden to citizens' eye.

The advent of ICT has changed the traditional approach to knowledge, documentation and communication of Cultural Heritage, opening the doors to new research scenarios and as of yet not extensively explored synergies and leading to an increasingly high demand for standards and methodologies internationally shared (London Charter, Seville Charter).

At European level, the growing interest in this challenging domain is proved by different EU funded projects aimed at 3D digitization (EPOCH, 3D-COFORM), the creation of databases shared on the network (EUROPEANA, CARARE, 3D Icons, Ariadne), the identification of global shared standard (MINERVA), the creation of network of excellence on issues related to Virtual Museums (V-MUST.NET), the identification of best practices and the identification of open and interoperable formats that allow the reuse of 3D models.

Among the research developed in the field of underground heritage, we can highlight the START project concerning the Roman Catacomb of Saint Domitilla [1, 2]. The mainly aim of the research was 3D documentation of the archaeological complex along with its early-Christian funerary paintings by means of laser scanning. They have tested some solutions for the interactive visualization of the site and an out-of-core octree structure for the management and processing of the huge amount of data generated.

The Nottingham Caves Survey [3] is the first part of Caves of Nottingham Regeneration Project (CoNoRP) and is aimed at mapping, 3D documenting and visualizing of the labyrinthine complex of caves under the city of Nottingham. The project intends to encourage the city and its visitors to appreciate the caves for the unique historical resource they are. 3D acquisition is carried out by means of laser scanning, the point cloud can be cut and sliced into plans and sections, 'flown through' in short videos, and examined in detail either on the web or on desktop environment.

Among the projects aimed at the enhancement and communication of Hypogeous Heritage stands Etruscanning 3D [4]. Etruscan tomb Regolini Galassi in Cerveteri has been reconstructed on the base

of 3D laser scanning data. The funerary furniture that actually is exposed at Etruscan Gregorian Museum (Vaticans Museum) has been virtually rearranged inside the tomb. The innovative feature of this project is the interaction paradigm based on the use of natural interaction interfaces (MS Kinect). Always related to the communication of cultural contents of Hypogeous heritage we can highlight Matera città Narrata [5]. This is a project aimed at the creation of a digital platform able to support the public before and during the visit of Matera (World Heritage since 1993), providing cultural contents by multiple communicative formats and access possibilities. The main components of the project are: the multimedia web site, adapted also for smartphone; cultural contents and applications for mobile devices.

Fig. 5-6: The three-dimensional model of the cubicles of Eusebius and Paul in false RGB visualization.

As stated in the introduction, the aim of the study concerning the Catacombs of San Giovanni is to comprehensively document and communicate this heritage, according to a strategy that integrates latest technological developments in 3D data acquisition, archiving, analysis and communication. Dealing with a so complex site some question arises and need to be answered:

- How to choose what is relevant for documenting this site? What is the level of accuracy needed? We can document for conservation studies, restoration, architectural analysis, history of art or archaeological research. Each of these fields has different goals and needs a different level of details. How can we integrate them and give an appropriate and scientific answer to all the disciplines involved? May we still use the same equipment that we use above the ground? Most probably the lighting conditions and the presence of narrow, high and irregular tunnels will require the development of new solutions and methodologies. Furthermore, once everything is documented, another question arises: how can we describe the process of documentation and make it transparent? It is necessary to test new ways of exploiting 3D models potentialities. Each kind of data acquired during the surveying phase should be normalized, catalogued and integrated into an articulated digital model.
- How can we organize a 3D repository which will include also legacy data, all bibliographic references and previous works? How can we link data and metadata directly on the 3D model? We need to develop an intelligent repository where all data are organized and linked to metadata and will be available in future.
- How to transform scientific data and convey it for public information/knowledge? How to simplify and optimize the 3D model in order to reuse it in different communication outputs (web, on line/desktop application, real time) and reach financial sustainability? The Virtual Reality (VR) becomes the best way to access, visualize and interact with this hidden cultural heritage. We should think in terms of Virtual Museums (VM). Which is the best way to communicate a hypogeous site? We need to investigate new creative scenarios that technology can open up; the outputs generated by the use of innovative advanced VR systems, hybridization and combination of media, artistic approaches [6, 7, 8]; think in terms of sustainability, durability and reusability of formats.

3. Historical and Structural aspects of the catacomb of San Giovanni in Syracuse

Mariarita Sgarlata

Suburban cemeteries, fanned out from the area of Fusco, in the quarter of Neapolis, to the Santa Lucia area, in the southern part of Acradina, this indicates unequivocally what the perimeter of the city must have already been in the early and mid-Roman Empire. The History of the area, which was going to hold the catacombs (San Giovanni, Vigna Cassia and Santa Lucia), spanned the centuries between the classical Greek and late antique ages, gradually giving evidence of quarries (Latomie), water supply systems to the city, characterized by cisterns and aqueducts [9: 682], handcraft workshops from the beginning of the 4th/3rd century BCE and burials datable to the early and mid-Roman Empire.

The quarter of Acradina therefore had a different designation and held in part a proper Ceramic with workshops. It is no accident that if hydraulic systems and furnaces have been found inside the three biggest catacombs. The funerary evidences prior to the creation of monumental community cemeteries – and among these San Giovanni holds a very special position – are columbaria, hypogea of different sizes inserted into the catacombs or isolated from them and *sub divo* burials, all datable to the first three centuries of the Roman Empire, if not beyond, and commissioned by pagans.

Several interest will be given to structural aspect of the catacomb of S. Giovanni, practice of funeral rituals, ethnic and cultural fruition's characters, transformation in the use, transformation in the way of using spaces for graves, to complete a general point of view about the phenomena of continuity and innovation as to previous sepulchral arrangements and, in the analyzed periods, the facies belonging to the different settling, variegated in the committees' ideological and religious themes, in choosing monumental types (like rotundas) and decorations, in self-representative aspects, in burial uses. In this perspective we will give particular importance to the study of executing techniques, of material employed, of working funerary organization. Just as in Roman catacombs, but with a bigger monumentality, the project of the catacomb of S. Giovanni involves realizing a regular urban plan for the subterranean city of the dead. In the catacombs, indeed, the exploitation of pre-existent hydraulic structures is not unusual: aqueducts, private channels, circular section well and conical or bell-shaped cisterns [10,11].

The same happens in the catacomb of San Giovanni, with the diversity due to a well-defined project; in several cases the *fossores* (gravediggers) were forced to demolish or amputate the cisterns that, because of their position, influenced the construction of the regular structure according to the project. It is feasible to see numerous cases of hydraulic installations reuse, which facilitated the realization of galleries, *lucernaria* (skylights) and private chambers (rotundas of *Marina*, *Adelfia* and *Sarcophagi*).

It only remains to make a choice between two possible explanations: 1) it is a case of a *pantheon* constructed *ex novo* on the pattern of the mausolea above ground, as the rotunda of Antiochia in the northern region, to suit both the local and passing members of the élite, without any influence imposed by preexistent hydraulic structures [12: 764]; 2) the rotundas reuse hydraulic preexistences and adapt them to a private vision of the space. In this case the presence of previous structures (cisterns of large dimensions), probably increased even further and whose undeniable traces remain (openings for drawing water and inspection pit with platforms) and have been the input for creating subterranean *mausolea* [13: 81-83].

Fig. 4. The ground plane of the catacombs where the areas of interest are highlighted.

The alignment of the three rotundas would be, in this sense, related to their original utilization from above (for the system of the lined cisterns in Syracuse see [9: fig 3], more than the alignment of the roads and neighboring hypogea [12: 763]. The former explanation for the genesis of this sector does not convince, mostly because of the idea of an adjustment of the alignment of the three rotundas with a nearby road, 350 m away from the catacomb, identifiable with a late mending of the supposed *via lata perpetua*, which served the theater area. A comparison with the alignment of neighboring hypogea, accessible through their own direct staircases and, as such, in necessary relation to the road network, is not proposable for the *mausolea* of the catacomb, since they are not in immediate relation with the above ground. The same central thread seems to link the three rotundas – of *Marina*, *Adelfia*

and *Sarcophagi* – to the solution adopted in the catacomb called “Grotta di Fragapane” in Agrigento [14: 205,215, fig 7], where preexistent granaries develop into circular chambers. The analysis of the funerary system certifies one hand the dependence on the Roman model, and other the debt in respect of local traditions.

4. Digital enhancement and management of the Catacombs of San Giovanni

Elisa Bonacini

Cultural tourism has become faster and demands quality in culture; museum’s audience wants more information during the visit especially with reference to the context [15: 132].

Many new technologies are available, or are currently being developed in the field of cultural management. Thanks to these ongoing technological changes, museum visitors and tourists are given more freedom to move past the limits of architecture and traditional tour guides. In today’s world of wireless personal devices, visitors can become mobile or even wireless visitors, who can access high-quality multimedia contents from anywhere. This evolution is based on new buzzwords such as connectedness, freedom, mobility, accessibility, walking tour [16: 67-222].

Use of ICT in fields of cultural management and tourism fosters the development of better cultural and touristic policies and strategies, which in turn create new value, in terms of creation of cultural value (providing new cultural experiences for consumers, whose expectations regarding consumer culture are clearly on the rise) and economic value (direct effect on cultural institution and indirect effect on the local community) [17; 18:112-114]. Therefore, cultural institutions must embrace a new philosophy of cultural tourism, which will use technology to allow visitors to engage freely with their surroundings and see past the surface and the visual space using tools, as multimedia guides, that allow contents that are not easily accessible in real life, or not visible otherwise, to be “accessible digitally” and to tell them “stories” that lie beneath great works of art and historical landmarks, enhancing the emotional side of an already highly evocative cultural journey. Fostering the use of digital technology in CH management is also crucial to bringing local museums and cultural sites up to the standards of national and international institutions.

Answering these issues, Catacombs’ digital enhancement and management project will see the integrated use of three systems: online and on-site communication systems and monitoring attendance, feedback and interest systems.

The museum’s website will promote the Catacombs that are currently open to the public (through the creation of an *Itinerary of the Catacombs*) and offer “virtual access” to the areas that cannot be visited. It will also give visibility to other local cultural landmarks by introducing combined offers and touristic routes. The website will be available in various languages and featuring extensive descriptions and a comprehensive collection of multimedia resources (photo galleries, videos, 360° visits, 3D reproductions). The aim is to attract young visitors and schools to the museum by creating interactive games related to the Catacombs and building an online community through various forms of interaction and content-sharing.

To enhance the visitor experience on-site the museum will use innovative communication methods:

- multi-touch [19] multimedia tables featuring multiplayer interactive games that will make the visit more entertaining and fun, especially for young visitors and school excursions [16: 169-178];
- holographic projection [16: 161-169;19] of a 3D virtual reproduction *in situ* of Adelfia’s sarcophagus (the original is currently on display at the Paolo Orsi Museum) at the centre of the eponymous Rotunda; Adelfia herself tells her story, according to the most recent emotionally approaches in digital storytelling [19: 106-110; 20: 27-47];
- *WiFiGuide*© [21] providing multilingual information and multimedia contents about different key items spread across the Catacombs and the Crypt, using a specific App that drives you through Point of Interest (Pol); the information will be accessible on the visitor’s own mobile device or on rented devices (iPod Touch) via an underground WiFi network.

Two different platforms will be used to collect real-time statistical data that will help to define appropriate strategies: *eFlowAccess*© to monitor visitors’ access at the entrance and *eFlowFeedback*© to monitor their feedback at the exit [22]. Both applications use highly customizable templates to generate multilingual feedback forms and multiple-choice questionnaires.

Particularly, these two platforms will be integrated on the same server of multimedia guide in order to monitoring internal usage data to give direct insights into quantitative and qualitative secondary data. The data thus obtained are processed to get statistics and reports (graphs, bar charts, pie charts) for each individual item. The guide allows users to send direct feedback, but it also provides valuable information about visitors’ experience, both quantitatively (number of visitors, language, visitor flow by date and hour) and in terms of quality. The guide can also show the degree of interest towards different exhibits, but it also provides *performance indicators* such as the *attraction rate* (how many visitors were “attracted” to a specific exhibit) or the *sweep rate* (how much time they spent in front of

each item). With all this information at hand, the museum has a powerful tool to monitor visitors' behaviour based on primary quantitative and qualitative data.

Focusing its cultural product strategy on this guide as visit support, Catacombs of San Giovanni could provide *added cultural and economic values* and could greatly differentiate its quality of cultural supply compared to other local cultural and touristic institutions. This *qualitative differentiation* could contribute, on the one hand, to improve Catacombs' attractiveness both for tourists and for Syracuse's citizens; on the other hand, it could improve new economic conditions and management strategies [23:103-144]. Monitoring data (both quantitative and qualitative) via access and feedback platforms, as well as multimedia guide, the Catacombs will have a powerful tool to monitor visitors' behaviour based on primary quantitative and qualitative data. This should be considered the first step in building a coherent Marketing Information System (MIS), which is essential to the implementation of new strategies and cultural policies and to the segmentation of the consumer base into specific target groups in order to identify those who may require different types of services (*customer care*) and to increase overall *customer satisfaction*.

This system is in line with the latest standards in terms of integration of tourism development and cultural heritage management, which are easier to implement in areas that are not very extended [15: 136].

5. **From data acquisition to geometric interpretation of the complexity of the site** Mariateresa Galizia

The considerable historical stratification of the catacomb of San Giovanni [24,25] as well as the high plano-altimetric and geometric-spatial complexity required a three-dimensional methodological approach for the survey, the representation, and the 3D visualisation. Indeed, considering the execution time and the precision and amount of data obtained, laser scanning was the best way to obtain a 3D model that reveals different historical spaces through virtual reality images [26,27,28,29, 30].

The archaeological site features an intricate network of communicating galleries and large rooms where there are innumerable burial niches and *arcosolia* cut perpendicularly into the rock walls and laid out side by side.

Fig. 7-8: In situ survey

During the first stage of the project, we surveyed two rotundas (Adelfia and Sarcofagi), and two quadrangular cubicles (Eusebio and Paolo) and analysed all metric data obtained, to find empirical evidence showing that pre-existing hydraulic structure such as water tanks, aqueducts or private canals had been re-used.

We used the Leica HDS 3000 ToF Laser Scanner, whose technical specifications are as follows: accuracy of single measurement position 6 mm, distance 4 mm; scan rate up to 4,000 points/sec; field of view 300°x270°.

The data acquisition project took into account:

- the complex grid system that is composed of a variety of galleries and large rooms connected together;
- the characteristics of the environments that contain multiple niches and *arcosolia* cut perpendicularly into the rock walls and laid out side by side.

The surveying protocol involved 6 scans: 4 for each space to be surveyed (in barycentric position, aligned with the skylights) and 2 “transition” scans. These last two were captured from the galleries so as to survey the numerous *arcosolia* in as much detail as possible, while also reducing the black areas inherent to the irregular morphology of the site's layout.

Fig. 9. Top view of the point cloud

To ensure proper alignment of the different scans in a common reference system, 29 reflecting targets were scattered across the walls' surface and they were automatically detected and registered by the scanner (minimum of 4 targeted control points for each point cloud). Once all field survey data had been recorded, point clouds were post-processed using specific software, such as Leica's Cyclone, Gexcel's JRC Reconstructor or CloudWorx. Optimising the calculation parameters (sub-sampling percentage, maximum number of iterations), the average initial maximum error of the alignment of about 10mm was reduced to 4mm. The comprehensive model thus obtained consists in 6 scans and a total of 46,940,251 points. Thorough graphic investigation of the point clouds was needed in order to document the geometry of the archaeological complex in plans and elevations without overlooking the site's spatiality and the complexities of its different areas. To draw the site plan we used two horizontal planes taken at different levels of the archaeological site, so as to be able to document its most outstanding features as accurately as possible.

Fig. 10: The vertical section of the rotunda of Adelfia extracted from the mesh model (MG & CS)

Moreover, we also carefully selected several offset vertical cross-sections, each of them showing specific views of the complex: axis between the entrances to the galleries, in the skylights' axis, in the centre of the rotundas and the quadrangular cubicles.

We also obtained section planes of the surface of the ceiling's intrados, as well as the amplitude and depth of the skylights. The arching of the intrados that covers the rotunda has the shape of a somewhat irregular, wrinkled inverted cone. This confirms the previous use of these spaces as water tanks, as can be noticed in comparison with other roman water tanks [31].

6. Problematics related to texture mapping

Graziana D'Agostino

The 3D digital “calque” of the investigated catacombs, thus obtained, provides the basis from which starting different research paths. One of the goal of this study is to give back the “visual appearance” of such complex heritage by means of realistic texture mapping [32,33] in addition to the quantitative and geometric aspects (shape, dimensions, proportions).

In this paragraph the problematic related to the 3D photographic reconstruction are highlighted. In this first phase of the study the cubicle of Eusebius was chosen. It consists of a small rectangular cistern that temporarily hosted the relics of Pope Eusebius before they were transferred into the catacombs of Callixtus in Rome.

The pipeline forecasts the passage from the numerical model (point cloud) to the polygonal one (mesh), the calibration of the images on the cloud point and the texture mapping on the point cloud.

The texture mapping phase was made using the software Cyclone by Leica Geosystem, instead the passage from the numerical model to the polygon model was made using the software JRC 3D Reconstructor by Gexcel.

Spatial information (x, y, z) relating to a single point is generally enhanced with the color component which is acquired according to three methods: a sensor inside the instrument; an external camera axial to the instrumentation; an external camera (for high-resolution acquisitions). Since the digital sensor inside the used instrument has a low resolution (equal to 1 megapixel), and the resulting effect doesn't fully reflects the real colorimetry of surface, then we proceed by applying to the point cloud high resolution pictures taken by the operator. The photographic acquisition project took into consideration the small size and the poor lighting conditions of the cubicle.

After several attempts to identify the optimal acquisition conditions (with or without the spotlight, with or without a flash, with or without a wide angle, mediating exposure and ISO sensibility), it was used a tripod and remote control distance acquisition, operating in a semiautomatic way and using a focal distance equal to 14mm, an ISO sensitivity of 800 and depth of field equal to f/18 by varying the exposure time between one acquisition and the other. Specifically, we used a Canon EOS-1Ds Mark III digital camera with 14mm objectives and a maximum resolution of 21 Mpixel. Barrel distortion of photographic images has been corrected by the software PTlens. The application process of the images is done through the manual selection of homologous points between the cloud and the image (at least 11). Particular attention has been paid to overlap two consecutive different textures, making them fit perfectly. The average deviation of re-projection was equal to 1.6 pixels (fig. 11).

Then the meshing phase was undertaken. Two different types of mesh were created. The first one was a tight mesh, in order not to lose important surface information, useful for two-dimensional representations, as orthophotos, the other one was a simplified mesh in order to obtain a lower amount of polygons for a better management and visualisation of the files in interactive virtual environment, also even on the Web (fig. 12).

Depth studies conducted highlight how the restitution of superficial and volumetric characters is particularly accurate and less subject to the operator interpretation, by using current 3D acquisition methodologies, especially in post-processing phase. The use of innovative technologies for 3D survey and representations as well as three-dimensional and colorimetric real data, is going to redefine the concept of representation and to test and to find out the extension of their use in the archaeological domain, as surplus of knowledge and information.

Fig. 11-12: Texture mapping(left) and mesh model (right) of the cubicle of Eusebio

7. Conclusions

Through this study, the hidden cultural landscape of the catacombs of San Giovanni is coming to light. Both the material and immaterial features (memory of customs, traditions and rituals of a civilization) have been analyzed and will be structured in a 3D information system [34] and disseminated.

To this day only a small portion has been surveyed and analysed. To complete the project large amounts of data will have to be acquired, modelled and processed, using specific procedures and advanced data processing technologies.

The challenge of this research is to develop a new methodology in the study of Hypogeous Cultural Heritage. Thus it is necessary to review the entire pipeline from data acquisition to communication: an efficient communication is based on data and information scientifically acquired and converted into engaging formats and languages.

Abstract

Museums represent institutions connected to local communities and their cultural life. Museums are not confined to a building and its collections, but may be located in 'open-air' spaces, allowing a tangible relationship between people and the surrounding landscape to be studied. Based on this ecological understanding, we would like to apply Gambardella's idea of an "Mediterranean Museum System of Design and Applied Arts" to the Turkish context. The idea is for an integrated museum system to link different archaeological and handcraft sites along D550 road from Çanakkale to Assos. Archaeological and handcraft sites are chosen due to their heritage significance and impact on tourism in Turkey. The route from Çanakkale to Assos has been less explored in terms of tourism and poses an opportunity to work with the local government to devise sustainable interventions. An inventory of the cultural landscape as well as strategies for landscape branding will be used to promote a sustainable intervention and to serve as a catalyst for the cultural and economic transformation of that region. The paper emphasizes an action-oriented approach to museology and concludes by asserting the role of architecture and landscape design in shaping cultural heritage and tourism in a sustainable way.

Key words: open-air museum; museology; landscape branding; archeological sites; architecture

1. Introduction

There is the need to structure and define museums in a new way. Open-air museums have been developed in opposition to the view of a museum as a collection-oriented work. In open-air museums, the means of representation should be accessible to people and connected to the local community. This bottom-up, community-based approach aims to protect valuable cultural and historical artefacts and promote local communities integration within their cultural landscape. A multidisciplinary approach of museology aims to acknowledge museums as a resource for the sustainable development of the environment. Both tangible and intangible aspects of person-environment relations need to be considered.

As a cultural place, the role of an archaeological open-air museum is to exhibit the heritage and cultural artefacts of a region by involving the local community. Cultural tourism has led to the discussion about the relationship between heritage attraction, tourism interests, and the local community. The purpose of this article is to discuss this relationship in the Turkish context and make a proposal for an open-air museum in the Çanakkale region. We propose an action-oriented approach to museology. It is inspired by post-processual studies (Hodder, 1985; 1982) which conceptualizes museum artefacts and the institutions that house them in critical terms--by asking how material objects are appropriated by different stakeholders in societies past and present. This critique to the role of

museum can be linked with current views of participatory planning and sustainable tourism development.

Turkey has 11 sites as part of the UNESCO World heritage and 37 nominated sites in UNESCO's tentative list (Turkish Cultural Foundation, 2013). According Hall and McArthur (1998) heritage management refers to the process by which heritage managers try to understand the relationships implicated in heritage practice in a way to accommodate the interests of many of the key stakeholders. The management of archaeological sites is thus shared by various stakeholders with different tasks and cultural backgrounds. While heritage sites have a cultural tourism purpose, they are also closely linked to a local community and to its perception and practices.

In relation to the present project--the process of "opening up a museum" needs--needs to be seen as a process of integrating artefacts with the local environment with the involvement of different stakeholders in Çanakkale. Open air museums may be a primary venue for archaeological research but can as well be integrated with nearby archaeological sites and handcraft sites to promote the economy of Çanakkale region. Turkey's most well know open air museums comprise of the Göreme Open Air Museum in Cappadocia (UNESCO World Heritage List since 1984) with its rock-cut churches and their frescos, and the Zelve Open-Air Museum, which is cave town, with religious dwellings, religious and secular chambers.

In this paper, we propose a museum intervention on the Çanakkale region in Turkey grounded on preservation, protection, and access of living communities in controlling, framing, and interpreting their own pasts. First, we describe tourism development in Çanakkale and next describe a proposal for a route linking archaeological sites in Çanakkale

2. Tourism development in Çanakkale

What are the natural-cultural resources in Çanakkale? Çanakkale has a unique potential for nature-based tourism (Yıldırım, Ak, & Olmez, 2008). The use of an environmentally integrated tourism development in the Çanakkale region will need the involvement of different stakeholders. We have been working with the mayor of Çanakkale on this proposal for an open air museum connecting different sites in that region.

3. Proposal for a route linking archaeological sites in Çanakkale

Çanakkale (Fig. 1) is settled at the North-West of Turkey, at the two sides of the Çanakkale Bosphorus that separates the Europe and Asia continents. Its antique name was Hellespont and Dardanelles. The initial idea was originated from a proposal made by Gambardella (2012) for a Mediterranean Museum System of Design and Applied Arts.

Çanakkale has many archaeological preservation areas and monuments dating from 4,000 B.C. These archaeological sites are connected by a route and need to be promoted in an integrated way. Our proposal is done in conjunction with the local municipality. The initial steps will be to work with architecture students through the Erasmus programme. We have planned a Summer school to develop the initial ideas for this proposal. In September 2013, architecture students together with faculty members will drive through the route and evaluate Çanakkale's different sites. They will meet with local authorities, residents, and local handcrafters to devise a sustainable tourism approach to Çanakkale.

Some of the tasks for the Summer school involve an inventory of the cultural landscape; discussion with local community; discussion and meetings with local craftsmen; and meetings and supervision with researchers in architecture, landscape architecture and environmental psychologists to further develop the proposal. The relationship between Çanakkale's cultural heritage, the local community and cultural tourism needs to be further explored. The tourism and heritage preservation should be focused both on archaeological artefacts and on the general cultural landscape and the type of life it provides to local residents.

3.1. Towards the objective: Preliminary steps for an archaeological route in Çanakkale

In this preliminary stage, the proposal comprises of four main phases which are described below. We propose to develop an open air museum to link six main sites (Ozdem, 2012; Akurgal, 1970/2011).

3.1.1. Inventory of the cultural landscape

The World Heritage Committee acknowledged that cultural landscapes represent the "combined works of nature and of man". They are illustrative of the evolution of human society and settlement over time, under the influence of the physical constraints and/or opportunities presented by their natural environment and of successive social, economic and cultural forces (WHC, 2013). Based on this recognition, the inventory phase must include all physical and cultural components which shaped the total landscapes in the region. The purpose is to undertake a comprehensive evaluation of the region

and map ruins of cultural and historical significance need to be conserved and restored to allow its proper use.

3.1.2. Field research and environmental mapping

Field research will be undertaken to assess the natural-cultural resources of Çanakkale and to evaluate different archaeological sites.

3.1.3. Focus groups and local meetings

In order to understand how tourism can be linked to local handcraft activities, we plan focus group meeting to be undertaken. The long-term goal is to promote the economy of the region. For example, traditional handcrafts of the region (pottery, muslin embroidery, carpet weaving) can be introduced to tourists in small workshops by local craftsmen. Also, interim meetings with faculty members at Okan University and other institutions in Turkey and local authorities will take place to discuss how the 'Çanakkale route' can be promoted through tourism.

Fig. 1 The natural and cultural resource map of the areas that have a nature-based tourism potential in the Çanakkale City (cf. Yıldırım et al., 2008).

3.1.4. Landscape and city branding

In order to promote sustainable tourism in the Çanakkale region, it is necessary to create an image of Çanakkale as a centre of cultural heritage value to be used in local and international markets. The Tourism Strategy of Turkey 2023 (Turkish Ministry of Culture, 2007) proposes a collective approach to marketing touristic regions in Turkey by combining cultural and natural resources to support local communities..

Figures 1-10. Selected sites with natural-cultural resources in Çanakkale

1. Çanakkale

According to the Turkish Ministry of Culture and Tourism, Çanakkale province boasts 175 archeological sites, 34 natural sites and five historic sites of outstanding value

2. Dardanos

Hellenistic tombs of the Troas, the Dardanos Tumulus. Findings date back to Archaic periods between 7th and 6th centuries BC and to the Roman period around 11 A.D.

3. Alexandria Troas (Dalyan Village)

According to Strabo, this site was first called Sigeia. A Roman colony was created at the location in the reign of Augustus, named Colonia Alexandria Augusta Troas.

The site sprawls over an estimated 400 hectares (1,000 acres); among the structures remaining today are a ruined bath, an odeon, a theatre, a gymnasium complex and a stadium. Also, the circuit of the old walls can still be traced.

Alexandria Troas is an important site for the history of Christianity. It has been mentioned in the Bible -in the 1st century AD with reference to Saint Paul and his missionary journey in Troas.

4. Troy

Human occupation on the site of Troy (Ilion) began in the Early Bronze Age (late 4th millennium BC). Troy II and Troy VI in particular are characteristic examples of the ancient city, with a fortified citadel enclosing palaces and administrative buildings, surrounded by an extensive lower town. Hellenistic tumuli were erected over the supposed burial places of these heroes, such as Achilles, Ajax, Hector, and Patroclus.

5. Neandria

The ruins of the ancient city of Neandria are on Cıgır mountain that is located in southwest of Ezine.

City's acropolis; walls of the city; Sanctuary of Zeus; necropolis; pithoses and monument-graves

6. Assos

Assos has an important historical asset with the 3 km long rampart surrounding the city and with the Athens Temple constructed at the highest point of the Akropol in the Dor style (530 B.C.). A historical theatre, agora, gymnasium, necropolis and the ruins of an ancient harbor are also the important structures of the region.

4. Conclusion

As Tucker & Emge (2010) have argued, the local community has played a minor role the tourism and heritage management processes in Turkey. It is necessary to clarify for the local community in Çanakkale how they can participate and benefit from the cultural tourism and heritage preservation in their area. In order to promote tourism and preserve the local environment in Çanakkale, this proposal for a route linking archaeological sites should be developed considering the sustainable use of natural and cultural resources.

An evaluation of the area's carrying capacity - to evaluate the ecologic and natural structure of the area - together with branding approaches which take local people interests in account should be developed in view of a sustainable planning and management agenda. Within this 'eco-cultural tourism' practice (Wallace & Russell, 2004), participatory planning may be promoted by involving local people in the planning, development and maintenance of archaeological sites.

Abstract

The present research project is focused on the systematization of a surveying and 3d documentation of sculptural heritage by using low-cost techniques, at the Universities of Valladolid and Salerno.

Even with the eminent development of digital documentation techniques, persist difficulties in the virtualization of objects with poor radiometric information (for image-based information capture) or certain properties of materials and their textures (for range-based information capture). The present study compares in a practical manner the use, scope and result of two methods that extract and manage images in a substantially different way: [A] Based on the correspondence of stereo pairs of pixels and its neighborhood –Shape from Stereo– [B] Based on the extraction of silhouettes by interpretation of the figure –Shape from Silhouette–.

The proposed case study collects some chalk sculptures of Jorge Oteiza, chosen for their special features for this purpose, ie parts of a uniform color textures, especially white, reflective or shiny.

Keywords: Photogrammetry, Documentation, Method, Heritage, Sculpture.

1. Introduction

The evolution of the digital documentation techniques on Cultural Heritage has found, since the 19th century, the photogrammetry as one of the best allies. The transition from analogue classic photogrammetry to digital, with the arrival of laser technology (Laser Scanner 3D) has allowed to develop a theoretical-practical framework guarantor of the digital reproduction of three-dimensional models with high levels of accuracy and reliability.

Even with the eminent development of these techniques, difficulties remain in the virtualization of objects with poor radiometric information (for capturing image-based information) or certain properties of materials and textures (for range-based information capturing). This is the case of much of the Jorge Oteiza works, particularly in the chalk sculpture's collection of the Museo-Fundación Jorge Oteiza [Fig. 1]. It is necessary to have methods and mathematical algorithms, occasionally forgotten, that postpone, for three-dimensional reconstruction of the object, its geometrical characteristics to the radiometric interpretation.

In these last two years we have been working in the Department of Graphic Expression of the School of Architecture of Valladolid (Spain) in the graphic surveying through the simple digital photography of some of these sculptural pieces, with different size and shape [1].

The pieces are a set of small sculptures of Jorge Oteiza who performed in white chalk or welding sheet metal then painted black. This is a collection of pieces that never had a graphic definition prior to its execution, so it lacks of accurate graphical information that would allow their restitution to the research and documentation; even for any damage to the pieces, on particularly to the fragility of the chalk. Its graphic documentation, through virtual models, would become an insurance against any adversity, thus gaining more interest. It seems inevitable that this precaution end up taken in all those works of art of recognized value [2].

This work is part of a Research Project we are doing at the University of Valladolid on low cost surveying techniques, financed by the Ministerio de Economía y Competitividad of Spain [3].

Fig. 1: Collection of chalk figures by Jorge Oteiza [Museo-Fundación Jorge Oteiza in Pamplona, Spain].

2. Work structure

The present study, starts from the theoretical analysis of two-dimensional survey methods which extract information from images (Image Based Information): Shape from Silhouette, based on the interpretation of geometrical characteristics of the scene and, Shape from Stereo, based on radiometric interpretation and pixels correlations in RGB images.

The process of 3D models generation by both methods involve an analysis in homogenization of shooting conditions and the implementation of templates coded- targets to strengthen the process and the relative and external orientation in each of the applications tested.

The comparison, focused in metric differences of generated meshes, will have as reliable reference geometric, data obtained from a laser scanner (Range Based Information) permitting an assessment of deformations with accuracies in the order of millimeter fractions.

The proposed analysis allow the selection of more accurate and efficient tool to generate models for objects and / or scenarios with similar geometric and radiometric characteristics. Also open new lines of research to further the advantages and disadvantages encountered in the study [Fig 2].

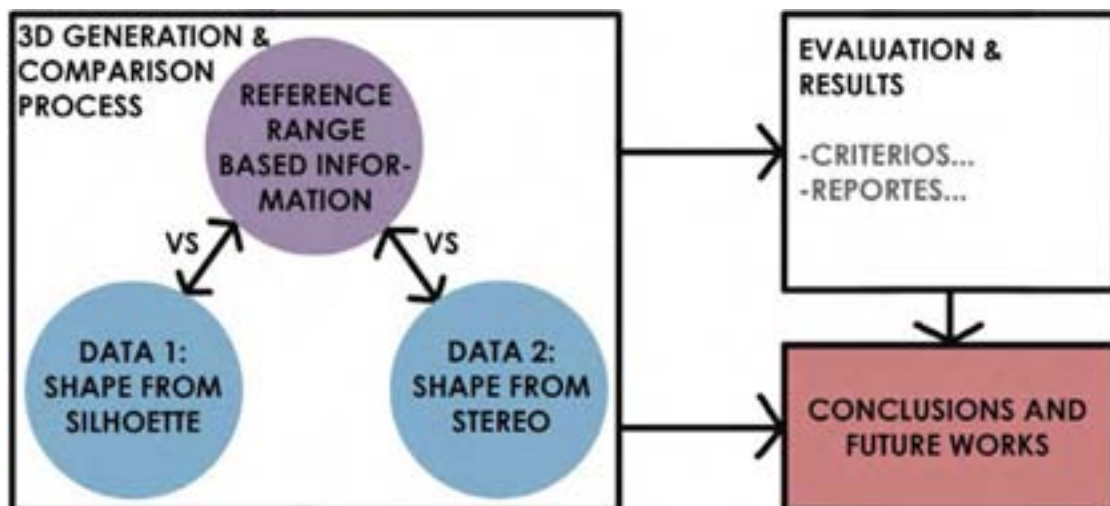

Fig. 2: Structure of the proposed work.

3. Capture from the geometric properties: Shape from Silhouette Method

One of the major difficulties for 3D reconstruction of Cultural Heritage often is the poverty information on images to reconstruct the scene. This occurs because, at present, the implemented algorithms in the most common reconstruction applications are based on the massive correspondence of pixels or set of pixels from a theoretically stereoscopic positioning. Shape from Silhouette method, however, based the reconstruction process on 3D shapes detection from different viewpoints, computing the intersections of the visually pyramids formed by the silhouettes (as generatrix) and the beam director

(irregular pyramid axis) from a well known viewpoint [4]. That's why is obtained the surface and the volume contained within the intersection of both visual pyramids (Visual Hull) [Fig 3]. The idea of using silhouettes for this purpose was first introduced in 1974 by Baumgart and formalized by Laurenti [5].

Fig. 3: [left] Visual Cone from a single point of view, [right] intersection of multiple cones on a three dimensional object.

Determining the Visual Hull, can follow two paths, from the characterization of its volume or its surface:

- Approach based on voxels: Space segmentation occurs into a large number of cubes (volumetric elements), called voxels and the shape is represented on a number of these three-dimensional measurement units. Therefore, the *Visual Hull* resolution is defined by the size of the voxels and the discrimination ability of full and empty voxels [6].
- Approach from surfaces: The second path is defined by the surface analysis, begin with the specific geometry analysis of the visual pyramids, and comprises the intersection calculus of polygons, defined by the spatial silhouettes projection through projection centers of the associated cameras, by various procedures that prioritize calculation speed (real time processing) or the quality of geometric result [7].

The limitations of the method are determined by the incapability to data capture beyond the pyramids intersections, and the inability to capture information in regions in "shadow" (occluded) from the capture points; characteristic in geometry with concave or acute angles, or in scenes structures where visibility is impracticable for a sufficient number of cameras.

Instead Shape from Silhouette provides:

- Approximations of 3D reconstructions which function as initiations or additional restrictions in complex models based on multi-view stereo [8].
- Processing with low computational cost, facilitating its implementation in Artificial Vision applications such as tracking, human motion analysis and 3D navigation [9].
- Alternative solutions when exist constraints in the number and positioning of the cameras, unlike other methods which require a redundancy in the three-dimensional approximation [4].
- Solutions front dysfunctions of Matching Methods in poor textured surfaces: These methods implement algorithms that base their operation on pixels recognition and matching (in two or more photographs), for it is not only necessary to find the homologue pixel, but also a neighborhood (more or less reduced depending on the mask used) to characterize the point in an uniquely and unambiguously way.
- Solutions to the laser scanner dysfunctions, finding especial application in cases where the laser scanner has an inefficient response to surfaces because the singular surface properties cause a poor response of the beam (the low power of the received beam introduces a large error in the estimated 3D point and sometimes does not interpret the return beam).

The software we use for this procedure is the application CX2 Strata 3D Photo v2.1. Although this is not an open source program, the ease of use through an intuitive interface, the ability to incorporate external orientation, as well as the wide variety of export formats for incorporation into assessment strategies, have proposed the application as a valid tool for the present study.

4. Capture from radiometric properties: Shape from Stereo method

The method Shape from Stereo based the acquisition process and 3D reconstruction in the encounter and detection of homologous points between stereo images. The location of these in a three-dimensional model is achieved by measurements made in two or more pictures. Once a point is

identified in each image, a line is drawn from the camera location to the point on the object. Is the intersection of these rays which determines its space position.

The algorithms are built on this principle require other complementary for the detection of coincident points, for which include calculations based on computer vision comparing different areas of each image in search of such correspondence. These are known as automatic correlation algorithms, and perform a comparison of a small window of pixels corresponding to the vicinity of one point on an image with the different possible point windows counterpart of the other image of the pair. This comparison is two-dimensional in the case of position of the pixel within the image matrix and can also be considered as a three-dimensional if we consider as a spatial attribute to the radiometric response of the pixel (gray level) [10].

The calculation algorithms try to find a unique solution and so use a technique that does not compare gray levels of a particular pixel but take small pixel matrix ($N \times N$) as close to him.

This method, which yields surprisingly accurate results, has however, a number of major difficulties:

- The number of operations required to find a pixel of an image on the other may be very large, which implies a high processing time. Also, if digital images are not very sharp or have not gone through a prior good process of radiometric adjustment, appears a considerable uncertainty in the determination of the homologous pixels.
- It must be added the fact that the images are affected by factors of perspective changes that make that the same object have a different radiometric response; hence the importance of the images are as parallel as possible.
- Another important aspect is when we find objects whose surfaces have extremely homogeneous textures and/or repetitive. In these cases it is possible to find common ground because all search areas are equal.

For this second method has been used software PhotoModeler Scanner 2013 [PMS]; a program that is not open source, but we have been working for some time, with excellent results in well-textured surfaces and that is directly linked to the Project Research cited above.

5. Documentation of the piece from IBI: Criteria, capture and processing

Once established the theoretical framework of methods of capture of Information Based Images (IBI) the study is focuses on the experimental evaluation of the case study. As mentioned, it starts in the establishment of criteria and guidelines for generating valid information under the same conditions and it develops the capture processes and data manage in order to obtain valid information for an accurate metric comparison.

5.1. Criteria for image capture

One of the conditions we have imposed on the point clouds calculation that each program has to perform is the departure from the same information. This means that the pictures that we take to the pieces meet the specific requirements of each program. In general terms as follows:

- Firstly the camera is calibrated, for which each program proposes its own procedure. The model must occupy the entire sensor. Is important to use a fixed focal length lens and do not move or the focus ring or exposure settings between shots. Finally lighting conditions must provide an uniform light, if possible, free of shadows defined.
- Photographs used in Photomodeler Scanner DSM projects should be in a parallel or close to parallel orientation. The cameras should be approximately one quarter the distance apart, compared to the distance that they are from the surface. This would be called a 0,25 base to height ratio. Base to height ratios of 0,1 to 0,5 are suitable. Highly convergent photographs usually do not work well with DSM since the surface looks too different but are necessary to solve well. So a DSM project will have a mixture of convergent and parallel photos. Lastly the photographs need to overlap on the surface being modeled.
- Strata needs of a small and stable auxiliary installation to lift the sculpture so the image appears surrounded by the bottom all the way around. Template and support are placed on a swivel that moves every 24° which gives us 15 images for each lap; images where the camera is virtually facing to the sculpture. It takes another turn raising the camera at an angle of approximately 45° to the horizontal; although this is sufficient between 3 and 7 photographs. There is still a take overhead.

We have designed a template including both Strata marks need to cameras orientation, as a series of 12bits targets which automatically recognizes PMS with the same purpose. Circular template as we have chosen to keep the camera completely fixed, preventing any movements change the focus distance, which incorporated a small fixed support.

This template curve constructed for the measurements of the piece (around $5 \times 5 \times 5 \text{cm}$), assume that each rotation of 24° results in a horizontal movement between each pair photographic of 9cm. If the distance between the camera and the sculpture is 30cm, we have the relation $b/h = 9/30 = 0,30$. Thus

there were 15 takes in a first ring with an angle of 0° with the horizontal, 15 outlets in a second ring at 45° and the overhead; in total 31 [Fig 4].

For both PMS and Strata were used the 31 photographs. For the first, although all pictures we used for strengthening the orientation, for the calculation of the points cloud were taken two by two, as the two described rings, in a total of 30 stereo pairs.

Because of Strata requires a homogeneous background to furnish the profiling silhouettes and because, turning the piece and not the camera, PMS would not be able to orient the photos, these are made on a canvas of black or white, depending the color of the sculpture to survey. This also has the difficulty that the strong contrasts between the model and the background increase in the picture. Therefore, the adjustment of speed and diaphragm on takes needs to reduce these light differences of the images. In any case, the shots have been performed on RAW format, allowing to reveal the images after shooting and correct and overly burnt histograms.

Fig. 4: Collection of images under the defined criteria and with the inclusion of the template designed.

5.2 Capture and processing with Strata Photo (SfSi Method)

For data acquisition was used a Canon 1000D camera with 24 mm lens, keeping constant its configuration over the entire sequence. Joined the encoded grid generated for the present study and were performed the photographic session raised under mentioned criteria in previous section (every 24° with a ratio $b/h = 0,125$ in two passes at 0° and 45° relative to horizontal axis, and a final Central capture) [Fig 5].

We proceeded to the automatically silhouettes extraction with good results due to the provision of dark background contrasting with the radiometry characteristics of the workpiece, and was processed in the same way the estimation of corresponding points and the three-dimensional reconstruction, yielding the surface mesh model. External orientation was defined by the introduction of general dimensions of the encoded grid.

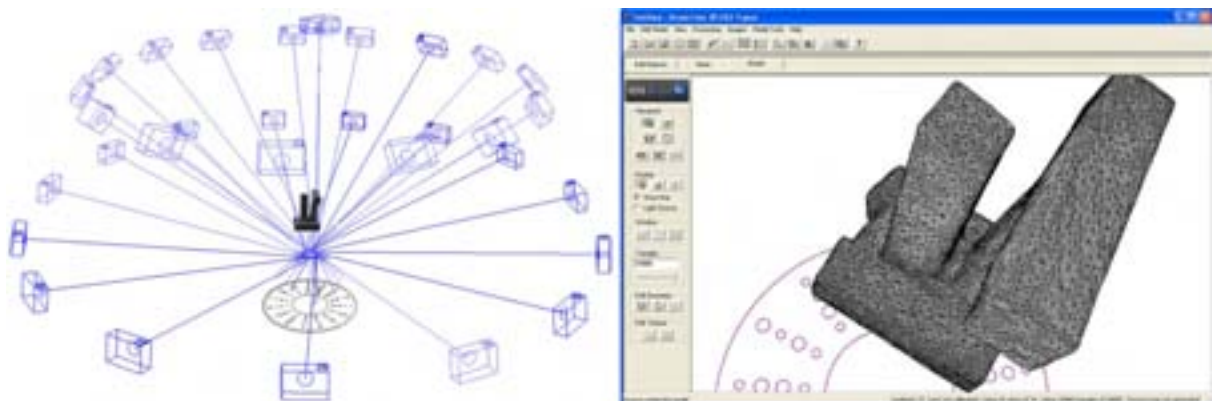

Fig. 5: [left] Cameras Orientation with Strata; [right] Surface Mesh from Strata.

5.3 Captura y procesado con Photomodeler (SfSt Method)

With the same images we performed earlier, and taken in pairs, PMS identify corresponding areas for each camera pair; and hardly able to locate homologues points due to the strong homogeneity of the texture of the surfaces to survey. Despite the settings the program includes both in the size of the areas or matrices to compare, as to be able to differentiate, and therefore understand in a different way, repetitive and not repetitive textures.

The software manual indicates how this 3D scanning process produces a dense point cloud from photographs of textured surfaces of virtually any size. Texture with radiometric properties, perhaps we should say photometric, necessities without which it is useless to try. However, it is the subject of this paper and to analyze the results.

This premise clearly predisposes us to estimate a poor resolution of the point cloud, because the pieces do not seem compatible with the software. However, there is a strong and recognized experience on this software, supported by many and such a wide fringe of time, which encourage us to try. We know of the excellent accuracy that PhotoModeler Scanner provides their models (with appropriate textures), which is expected to decrease significantly in this case.

6. Reference Data Capture: ScanWorks V5 with Romer Arm

The lack of dimensioned planes on the object and the uncertainty that may pose manually measure in a figure of small dimensions as the analyzed, leads to the need of generate a reference geometric model with a rigorously reliable. For the proven ease of use and the metric accuracy, was used the capture through Range Based Information [11] from the triangulation functioning.

Limitations of laser scanner as active sensors in surfaces with singular properties: specular reflection, high light absorption, variables refractive index, etc. [12] often introduce data error visible or able to be determined by metric evaluations [13]. We have therefore resorted to the Perceptron ScanWorks V5 laser scanner with Romer arm using triangulation operation to capture the profiles by the intersection of a laser plane and the object topography. This industrial dynamic range scanner allows calibration respect the surface properties of the documented object, estimating individual characteristics of the emitted beam for a correct response interpretation. Moreover capture speed (up to 458.000 points higher than conventional probes or points, the field of view: 140 mm, depth: 100 mm, the minimum resolution of point to point: $12\ \mu\text{m}$ [14]) as well as Romer Arm movement facilities (6 degrees of freedom), proposed as an ideal device for the reference image generation.

Fig. 6: [left] Laser plane projected onto the piece for three-dimensional reconstruction by triangulation; [right] mesh obtained from 3D point cloud from laser scanner, viewed in MeshLab App.

7. Geometric Data Comparison

To perform the comparison was used Ivnometric Poliwork software and its modules *IMAlign* for surfaces generation from the laser scanner point cloud (without application of smoothing, tolerance or reduction) and *IMInspect* for the alignment and geometric calculation of the metric differences between the reference and data surface ($SfSt$ and $SfSi$).

Fig. 7: [1] Overlapping point clouds obtained from Shape from Stereo method (darker) versus Laser Scanner Data (lighter); [2 and 3] Side and top views of the overlapping meshes: Shape from Silhouette mesh in red versus Laser Scanner Data mesh in green.

7.1 Shape from Silhouette Data versus Laser Scanner Reference

12.709 points of the 13.344 were compared at a range of $\pm 2,6\text{mm}$, for 95,24% of the points within the comparison range. The average was 0,34474mm with a S standard Deviation of 0,5174mm, while all the points converge within 5 times the Std. Dev.

Fig. 8: Graphic scale of geometric differences of the mesh obtained from Shape from Silhouette: [left] Major errors identified in the inner edges of the figure; [right] Errors identified in horizontal and vertical parts connection.

7.2 Datos Shape from Stereo frente a Referencia Scanner Láser

1.234.952 points of the 1.281.071 were compared at a range of $\pm 1,6\text{mm}$, for 96,40% of the points within the comparison range. The average was -0,0434mm with a Standard Deviation of 0,3278mm, while all the points converge within 4 times the Std. Dev.

Fig. 9: Graphic scale of the geometric differences of the mesh obtained from Shape from Stereo.

While results in mesh generation suggest a superiority of *Shape from Silhouette* method because the possibility of reconstructing the entire surface without sudden jumps or discontinuities, pixel correspondence with *Shape from Stereo* was limited by radiometric poverty, with an heterogeneously reconstruction of the piece, increasing density in vertices and corners but decreasing in central regions of the sculpture's plane [Fig 7]. In the other hand, metric evaluations were based on the geometric comparison between the results of both methods, allowing the identification of irregularities on the generated surfaces from silhouette within a wider variation frame, detecting errors close to 3mm ($\pm 2,6$ mm max.) while the surface reconstructed by stereo pairs remained an error less than 2mm ($\pm 1,68$ mm). Errors distribution found also substantial differences, responding to the internal function of each method [Fig 10], detailed in sections 3 and 4.

Fig. 10: Distribution of the reconstructed data from photogrammetric techniques.

8. Conclusions and future work

The theoretical study of Shape from Silhouette method allows retake math implementations over 20 years old, which can be reused at present thanks to new technologies and new society needs. For Heritage sculptural pieces, particularized in those which have poor radiometric characteristics: dark colors, repetitive patterns and materials with little response to light stimuli, this method obtains significant advantages over others as the Range Based Information capture or photogrammetry techniques based on 3D restitution and massive correspondence of pixels (Dense Stereo matching). With the case study we proposed, we can estimate the real advantages of this system, not only in the geometric order, but also in terms of economic costs, taking into account that for the 3D model generation was needed only a Reflex Camera and software (on the order of hundreds of euros) while other systems such as the laser scanner, only the equipment can reach the tens of thousands of euros, in particular ScanWorks V5 with Romer Arm has an estimated price of more than hundred thousand euros.

Amplitude and scope of the methods implementation: *Shape from Stereo* and *Shape from Silhouette* for studying sculptures with poor radiometric characteristics, makes it impossible to cover in full in a presentation. Detected some of its weaknesses as the impossibility of identifying points in repetitive patterns, the errors introduction in silhouette segmentation or the lack of evaluation of camera calibration in relation to the results obtained, particularized studies are essential to answer these issues. This paper then proposes the following research lines:

- Study of the influence and behavior of *visual hull* calculus (surface or volume calculation systems) from figures based on curved surface to pieces with a high degree of orthogonality in its structure.
- Geometric reconstruction from a unified system, comprising *SfSi* and *SfSt* methods to try to overcome the disadvantages identified: Faults in the massive reconstruction of the surface (Dense Stereo Matching) for *SfSt* and precision errors for *SfSi*.
- Detailed analysis of the data distributions in connection with the operation of each method.

Ancient ruins of the future

Adriana ROSSI

Department of *Civil Engineering, Design, Construction Industry and Environment* (DICDEA) Second University of Naples (SUN). Real Casa dell'Annunziata. via Roma, 29 – 81031- Aversa (CE)- Italy. e-mail: adriana.rossi@unina2.it;

Abstract

The *Herculea Telesina* in the region of Campania is certainly not a fragment but an almost continuous defensive wall. The strong point of this particular project for siege defense being geometric criteria that have remained practically unchanged even when the weapons themselves evolved. The ruins offer a vast repertory of useful signs: the contemporary scholar can not only acquire the teachings of a culture that was much advanced compared to the Roman world, but by observing the angles and vectors can ponder the absence of any changes in the measurements that were subordinated to tactics and thus to human needs. Decisive factors that elevate the walls of Telesia to the level of a cultural testament still to be discovered.

Keywords: landscape, ruins of defensive walls, unchanged flanking tactics.

1. The ancient ruins

Gently contained within the farmlands of San Salvatore Telesino, the city founded by Roman settlers in the 11 century BC, perhaps subsequent to a pre-existing Samnite centre, it is serenely inhabited by its residents and enjoyed by numerous visitors.

The ruins of the fortified walls are fully integrated into the particular physiognomy of a valley that united the provinces of Benevento and Caserta, adapting itself to their physical, anthropic, biological and ethnic characteristics. The vista and the significance of this archaeological site that lies concealed from those rapidly passing through the main road, but that unfolds to any who venture along its packed earth roads, comprises the remains of a very ancient theatre, thermal springs and an aqueduct that brought water from the mountain located six miles away. As far as can be distinguished there were three principal gates, with an undefined number of posterns distributed along the perimeter and now partially visible.

According to the Greek historian Polybius, the Carthaginians conquered the city in 217 B.C. when it was still « *without walls and provided with all types of supplies*» [Musi, 1978]. Fortified by the legionnaires of Silla it was never attacked. One of the reasons being its impregnability, a trait that has prevented any verification of its system of defense, the only one of its type in the entire empire.

The unique structure of the fortification is obvious if viewed from above. It is a wall composed of a series of outwardly facing concave sections.

At the top of each linkage is a sort of hexagonal solid tower alternating, with no apparent order, with others of a circular shape. Both protrude out of the curtain wall by half, justifying the technical name of *mesopirgi* walls (*mesos*, semi; *pirgos* towers).

The segments of wall are not linear and thus have a succession of “recesses”, to use an appropriate, though Renaissance, term, whose “salients” end in a single exterior edge. In this manner no side is concealed from active defense as only the sharp corner of the protruding body faces the field of battle. Furthermore, it goes without saying that in order to effect perpendicular strikes against the hexagonal facade of the avant-corps-tower, enemy artillery would have to be stationed at least 30° to the right and to the left of its axis, exposing its flank to close and perpendicular fire launched from the right or left towers.

Fig. 1: Section of the concave segment of the curtain wall with hexagonal towers

Fig. 2: Detail of insertion hexagonal tower-curtain wall.

Fig. 3: Telesia: reconstruction of hypothetical layout of the Capuana Gate and in vertical sections.

The structure is in opus incertum or almost reticulatum, with an internal core of cement, which is also extended to fill the avant-corps. Their placement is irregular. To the south-west and to the east two small streams are located close to the masonry perimeter. According to experts of military architecture tactical border support is the reason why the interaxis among the projecting reinforcements passes from more than 75 meters along the Trono riverbed to a canonical average of 45 meters, that at times even descends to 30 meters: «The system of fortifications becomes proportionately more complex as natural defense decreases, the most obvious proof is the frequency of towers, sporadic on the two linear sections along the moat and built one after the other at a certain distance» [Qulici, 1986: 85]. As there is no natural defense to the north and to the north-east, the project for a good active defense of the walls was the only support possible.

The wall's unassailability cannot be attributed to the solidity of the walls as these are too slim, being little more than 1.7 – 1.9 m thick and slightly over 10 meters high. To be located inside a defensive circle certainly protects from enemy attacks, but it provides no protection from an enemy who would scale the top to penetrate within!

In order to stop an attacker from trying to overcome this obstacle, it was necessary to fire stones or wood against the enemy, possibly from above, thus transforming simple passive defense to active defense. Following the ancestral experiences, a vast repertoire of defensive weapons became the indispensable complement to the fortification, to the point that the structure of the walls evolved to fulfill the need of optimizing weapons performance.

Since an attack took place by a mass approach toward the base of the walls, it would have been sufficient for the avant-corps to protrude from the exterior facade and to shoot arrows in rapid succession from the top toward the flanks of the attackers to inflict terrible losses. However, the interaxis between the towers had to be below the range of the bows and torsion artillery, thus no more than about fifty meters, equal to about a hundred cubits: the canonical distance for walls of Hellenic matrix. In fact the unknown architect of the walls of Telesia appears to have been inspired by this culture following the undertakings of Alexander against the Persians. There are certainly justified grounds for maintaining that the decision to opt for a non-obvious perimeter such as linear curtain walls or a fixed wall like the ones built near tactical borders was inspired by the studies of Philo of Byzantium (III century B.C.; ca. 280 BC – ca. 220 BC). A student of Ctesibius, Philo wrote a *Compendium of Mechanics* (Μηχανικὴ Σύνταξις), most of which has unfortunately been lost. Of the *Paraskeuastika* (παρασκευαστικά) – “On Defense Structures” – and the *Poliorcetica* (πολιορκητικά) – “On the conduct of sieges” – large sections have been saved, transcribed from the Greek and translated into European languages. In light of his theories, the reasons for suggesting that towers be given a hexagonal shape (Philo. bk. V, A 3-4) and curving the sections of wall between two towers [Philo, lib.V, A, 39-40. Garland, 1974: 296]. appear evident. Not so obvious however are the parameters to be given to these curves. A plausible answer is found in the traces of ancient vestiges found in the field.

Looking at the north gate from the outside, where the ground lacked any natural conditioning that would rule out compliance to an ideal model, it was found that the span of the concavity is 44.50 meters and the height is 6 meters. If we then take six points of the curve, on the same level as the perimeter – the number required to definitively confirm the wall's transformed homology from a polylinear form, Pascal's Theorem (1640) [Docci-Migliari, 1992: 461] – we can confirm what had been visually intuited: this is a lowered arch (dummy) that, having nothing of the oval profile, is traced as a geometric site of the points equidistant from the center. How to find the center is an almost immediate procedure. After taking the distance between two *mesopirgi* it is sufficient to rotate the span from the opposite sides. The center of the curve will be at the point of intersection. One is the unknown, while three points (the two extremes and the center), if joined together, form an equilateral triangle: the internal angles each measure 60°. With extreme precision then the points of the curve are the vertices of the rectangular triangles inscribed within the resulting semi-circumference.

Fig. 4-5: Satellite views of various sections of the walls of Telesia

Fig. 6: Graphic reconstruction of a segment of the Telesia walls

The concavity of this layout multiplies the number of launch stations, thus allowing them to strike the attackers in the back as well as the flanks.

The avant-corps, with a hexagonal base as stated prior, are solid structures placed in position such as to reinforce the summit, as is evident by the outward corner reinforced by thick stone quoins.

Fig. 7: Graphic reconstruction of a segment of the Telesia walls

Everything indicates that their covering was at the same height as the patrol path along the curtain wall as there would be no other way to traverse it completely. Even supposing an internal expansion of cantilevered wood, the terrace formed on the top of the towers provided a comfortable space to maneuver soldiers and equipment. From that height the artillery could easily cover a field of 250° instead of the traditional 180° . Considering all these aspects, supported by the results of the measurements taken in the field and compared to those suggested by the treatise of Philo of Byzantium to build «slightly curved curtain walls», we converted the measurements in meters to cubits ($1 \text{ cubit} = 0,0444 \text{ m}$) and the centimeters to orgias ($1 \text{ orgia equal to } 177 \text{ cm}$), confirming that the canonical span of 100 cubits, approximately 44.40 m, is almost the same as the 44.50 meters measured on site. The same procedure was followed for the height. Since the wall is not intact at any point and the ruins stop at around 7 m from the ground, in reconstructing the sites we referred to the height prescribed by Philo. Thus to the prescribed height of 10.60 metri, we must add the height of the moat located in front of the walls. [Philo, bk V, A, 45].

In spite of the unquestionable expertise of the Romans regarding military capabilities, the concave curtain wall fortifications of Telesia remained an exception throughout the Roman Empire, such that it progressively fell into decline, destroyed by earthquakes and by the nearby waters, disintegrated by brushwood and dismantled by the farmers. The concept however incredibly survived, even adapting to powder artillery.

Fig. 8: Ruins of hexagonal tower.

From that height the artillery could easily cover a field of 250° instead of the traditional 180° . Considering all these aspects, supported by the results of the measurements taken in the field and compared to those suggested by the treatise of Philo of Byzantium to build « slightly curved curtain walls », we converted the measurements in meters to cubits ($1 \text{ cubit} = 0,0444 \text{ m}$) and the centimeters to orgias ($1 \text{ orgia equal to } 177 \text{ cm}$), confirming that the canonical span of 100 cubits, approximately 44.40 m, is almost the same as the 44.50 meters measured on site. The same procedure was followed for the height. Since the wall is not intact at any point and the ruins stop at around 7 m from

the ground, in reconstructing the sites we referred to the height prescribed by Philo. Thus to the prescribed height of 10.60 m, we must add the height of the moat located in front of the walls [Philo, bk V, A, 45].

In spite of the unquestionable expertise of the Romans regarding military capabilities, the concave curtain wall fortifications of Telesia remained an exception throughout the Roman Empire, such that it progressively fell into decline, destroyed by earthquakes and by the nearby waters, disintegrated by brushwood and dismantled by the farmers. The concept however incredibly survived, even adapting to powder artillery.

2 Future legacy

If the surveys are compared to similar examples (Spanish catenary walls: *Obuleula*, the Roman *Urso* and in the same region, *Pajares*) on the one hand and to the study of a theoretical model derived from the classical treatise on the other, the surveys allow for reconstruction of a reliable picture of the scientific knowledge available to military strategists of the second century before Christ.

It appears at the very least singular that this example remained an exception in the empire as similar ones in Spain, lacking contemporary estimator or more likely obsidional verifications, had been abandoned for quite some times. But this was not actually the case if one considers the development of military architecture.

Among the multiple objectives of history, or perhaps better of histories, is that of stimulating learning and study and the consequent desire to identify the primary factors, these being the basic requirements for understanding the present and even more so the future, since human actions throughout history have always been dictated by physiological needs.

It is from the existential needs that the history of technology, of conventions and of interpretative and critical stratifications to which the works led and from which they have determined a direction, control and verification, that one may extrapolate those permanent concepts that, viewed from the perspective of a new scientific spirit, suggests new ideas. «In the intention of the scholar, the culture of a specific period expresses the manner in which, according to changing historical conditions, themes and concepts, the essential tendencies of the human mind are revealed». [Panofsky, 1973: 105].

Leaving the angles and directions unchanged, the laws applied to the defensive wall of Telesia and suggested by Philo of Byzantium, also apply to the design of fortifications built around the end of the seventeenth century, when the range and masses of projectiles made it necessary to reshape the bastion-towers. The senior officer, Sébastien Le Prestre de Vauban, builder of over a hundred fortresses, had conceived of a regional defense tactic of boundaries known as the *Pré Carré* tactic: a set of fortresses regularly spaced among themselves that did not allow for the passage of an army in the corridors that were left free. Today we well know that his theories led to the construction of the Maginot Line used between the first and Second World War. We may thus conclude that the only tactical variable in this context was the power of the weapons, a result of technological evolution, but certainly not the criteria of active defense subordinated to human measures and needs. In this perspective the concave segment curtain wall of Telesia demonstrates how the Silla colony that flourished at the foot of Mount Acero, acquired a merit that places it greatly in the avant garde of the contemporary Roman world. Much more important than flanking tactics, and one of the many reasons for encouraging the study of the ancient ruins immersed in the countryside of San Salvatore Telesino, is the usefulness of identifying the primary factors, essential in achieving an understanding of the present and, even more significant, in anticipating the future, given the ever present and much too obvious repetitive nature of human actions dictated by physiological needs.

The monumental unit of Massenzio: environmental requalification project and development of the archaeological emergencies

Maria Grazia CIANCI

Department of Architecture, The University of Studies of Rome Tree, Rome, Italy
mariagrazia.cianci@uniroma3.it

The monumental unit of Massenzio

The unit of Massenzio, one of the most evocative archaeological areas of the Roman countryside, lies between the second and third mile of the Via Appia Antica. It consists of three main buildings: the Palace, the Circus and a Mausoleum. They were designed into a single architectural unit that was conceived to celebrate the Emperor Maxentius; the unfortunate opponent of Constantine the Great in the battle of the Milvian Bridge in 312 AD. The complexity of the space of this area is tied to the close relationship between the historical artifacts found and their relationship with the road, nature and the surrounding landscape. In terms of space, these close relationships create completely spontaneous micro-landscapes and micro-gardens within them. They naturally gather data and useful information to fully understand the system. Today, the debate is based on the need to take protective measures for the monuments of the Via Appia Antica. From a first partial analysis, the monumental unit of Massenzio showed different issues; problems tied to a correct understanding of the historical plant, problems tied to the management of the area and to the state of degradation of the ancient structures, but also problems such as the lack of incentives and services to entice visitors. In this situation, the study reported here raises a number of points to create a very articulated program subdivided into different phases to implement the requalification of the monumental unit. The objective of this work is to define a method to make sure the following projects and interventions are consistent and in line with each other and with the purposes established to develop the area in a proper manner.

Keywords: Requalification, archeological emergencies, Circus Massenzio, Mausoleum

Fig. 1: L. Canina, The monumental unit of Massenzio, sec. XIX .

1. Archeology, History and Nature

The monumental complex of Massenzio, on Via Appia Antica, represents a huge heritage of memories for all travelers who, once in Rome, had the opportunity to go down this marvelous street full of charm, history, perfumes and "souvenirs".

A description can lead us to love, hate or possess a place; the way places and landscapes are described creates representative metaphors and symbols. A description intervenes, manipulates, distorts and creates an environment. It plays an active role as far as our collective imagination is concerned.

When Goethe came to Rome, especially in the complex of Massenzio, he felt like he had always lived there, as if he already knew every aspect of it or felt the emotions released by this memory keeper. The imagination that had characterized his childhood was able to move beyond the symbolism of abstraction and to grasp the warmth of reality: *"[...] It was as if he was born and raised here and was just coming back from a trip to Greenland, where he was whaling"*.

Descriptions strengthen our thoughts, many of our thoughts. Our thoughts enrich reality and lead us beyond the description of a state of art.

The relationship with the surrounding world is undoubtedly a primary source of inspiration and we certainly are aware of its doubtless value. Being able to perceive a place in an appropriate manner is a natural instinct that depends on every individual's sensibility, but also the result of being able to control the information contained in a project.

A project based on the desire to promote the areas examined is subjected to the control of a close relationship between the various systems that characterize a place.

The natural system, as the historical, archaeological and architectural ones, depend on each other thanks to a natural thrust that is also determined by the sensitivity of those who go to work in them. The area around the complex of Massenzio contains many elements of this kind, even though not all of them can be felt today. However, we can feel their value, even after all this time.

Observing and feeling the sensation that a place can transmit and being able to transform this into an explicit potential means enhancing the nature of the artifact to understand it better, to bring it back to its ancient splendor and to recreate a relationship with its environmental context.

This is the objective of the study: history, archeology and nature as a whole.

Fig. 2: M.G. Cianci, Sketch along Via Appia Antica near the monumental complex of Massenzio.

1.1 The artifact and its context

The monumental complex of Massenzio on Via Appia Antica is part of a zoning project within the General Regulation Plan of zone N - public parks. These areas are natural green public or equipped areas that are subjected to specific actions or tools that are approved by City Council. In the same way, they are also part of the "Strategic Planning of Archaeological Park Framework as Monumental Forums of Appia Antica". This strategic framework focuses on large green areas with a significant archaeological, architectural and environmental value.

The objectives of the framework in general are as follows:

- Promoting and protecting the organic features, already consolidated by the way the district looked during the post-unification process and with the 1911 (Archaeological path) adjustments, as well as those undertaken in the 30s.

- Greater understanding and usability of the different contexts in full respect of their historical and environmental values.

- Requalifying the areas that are intended to become Parks.

- Characterizing the history, environment and nature by paying attention to the history of the existing archaeological system.

The existing relationships between the monumental complex of Massenzio and the surrounding areas are essential for being able to understand the artifact, but also to establish the most important actions that must be taken.

The monumental axis reconnects the archaeological area of Appia Antica to the main archaeological area. The same "archeobus" line connects Piazza Venezia, the Colosseum and the Circus Maximus by passing through the Aurelian Walls to reach the archaeological Park of the Appia area. Along this path, one can identify the parts of the Park that are being used: bike rental points, services, buildings for the activities carried out in the Park.

Connection to the neighboring areas is ensured thanks to different types of roads that define the margins of this large area. The bike and pedestrian paths of the Caffarella Park sharply connect at Via Appia Pignatelli and later at Via Appia Antica in the opposite direction, which makes the visit more difficult. The route from Via Appia Antica underwent several changes that had a negative impact on its performance and original height (about 2.2 meters from the current one) in certain points; especially on the route between the complex of Massenzio and Cecilia Metella.

The Appia Park is North of the peak of the Aurelian Walls, West of Via Ardeatina and of the Rome to Naples railway, East of Via Tuscolana and of Via Appia Nuova (all the way to Frattocchie) and South of the village of Santa Maria delle Mole and of the ditch at the edge of the archaeological site.

The monumental complex of Massenzio is located in a strategic area of great historical value that clearly preserves some critical elements. Some interventions were already carried out on the latter, but the Government, especially the Managing Body of the Regional Park of Appia Antica, must still devote some attention to them. This body is a public entity with administrative autonomy that handles the recovery, protection and development of the natural habitats and landscapes. It exploits the goods of the archaeological areas, preserves the animal species and vegetation, the geological singularities or the natural environments with a special value of natural character, but it also manages the public heritage under its jurisdiction.

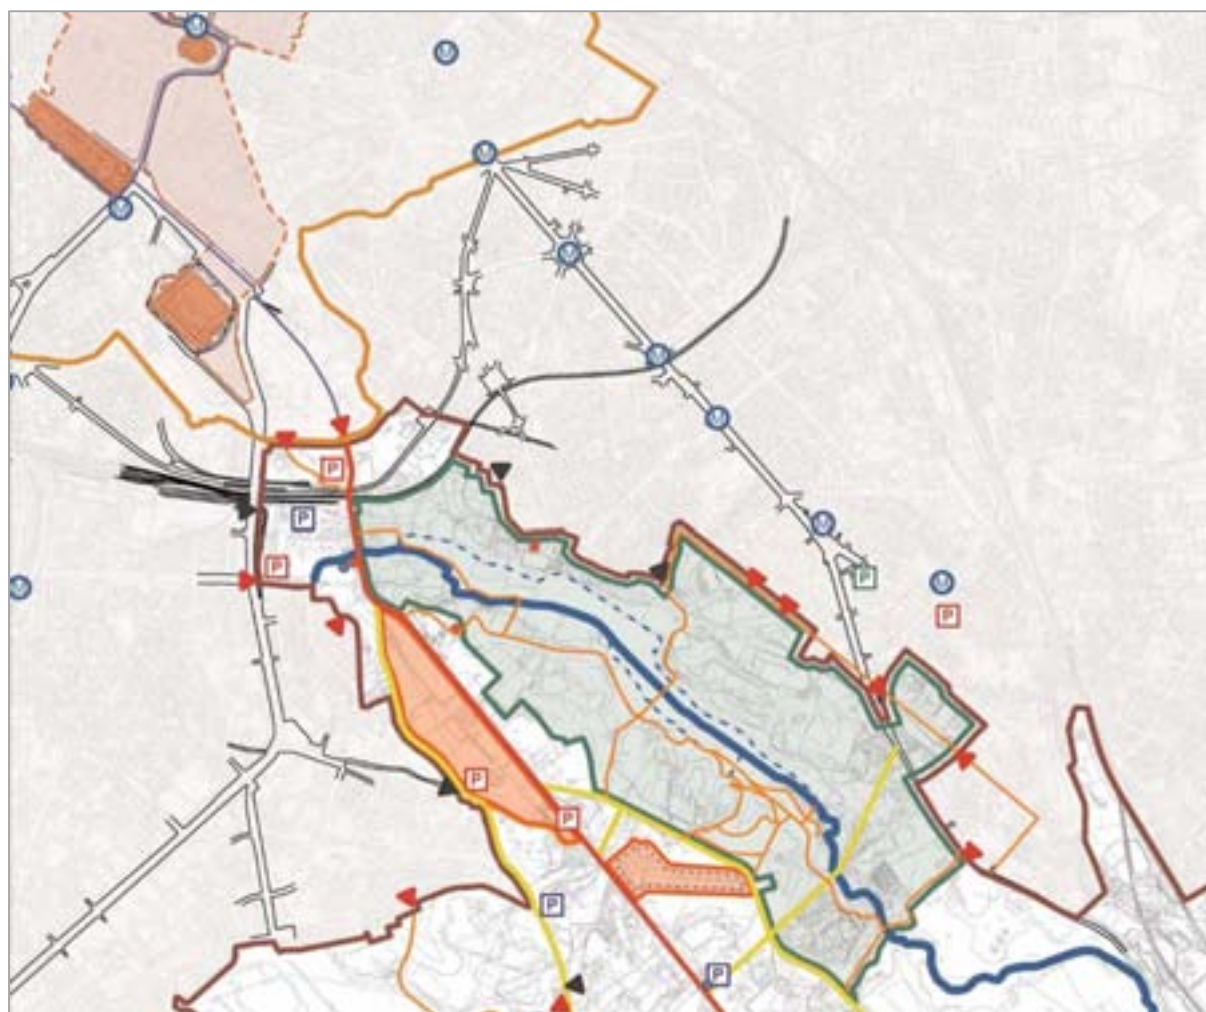

Fig. 5, 6: The monumental complex of Massenzio and its contemporary context: plan, legend and aerial photo.

1.2 The territory's physical features

The natural components of the Park of Appia Antica were greatly transformed by man over thousands of years. However, the general structure is still clearly evident. The volcanic origin of the land and the climatic conditions defined the rough appearance of this territory. This is also clearly seen on topographic maps.

The activity of the volcano of the Lazio region casted paths that were several kilometers long, especially in the Appia (Capo di Bove) area; therefore designing, shaping and creating the high grounds above the existing swampy plains.

The lava-casted area of Campo di Bove was used as the main road of Via Appia Antica for its emerging position with respect to the surrounding swampy areas, but also for its excellent soil, which was used to make the road foundations. In addition to the volcanic activity, the deep and superficial water also affected the land in a very special manner depending on the level of erosion. The water erosions made the land undulated, therefore creating obvious differences with regards to the way it was "originally."

In certain periods, the presence of these deep grooves, therefore determined by the soil's weak ability to resist to erosions, created a continuous activity of water canals both above and under ground, but this also caused the land surface to collapse. The mixed composition of the soil defines the different morphological design of the area.

On one hand, the presence of "pozzolana" and tuff defines the profiles that were detected. On the other, the "leucite" of Campo di Bove appears to have a rather flat course. The presence of volcanic activity from the underground sources led to the detection of significant natural phenomena.

An important aquifer concerns the red "pozzolana" and the ancient tuff; this underground source is 35 to 45 meters deep with respect to the fields of "leucite" of Campo di Marzio. It has supplied many Roman sources such as the sources of the Virgin Waters from the Appia area. These physical features of the territory are essential for an appropriate reading of the intervention area.

The morphological and hydrological aspects can help individualize the environmental interventions of the area that are needed by defining their structural setting.

Based on an observation of the stretch of the Appia Antica that was under examination, the corrosion of the land and a new resulting image were obvious.

The route of Via Appia, beyond the San Sebastian gate, crosses through a first trough through which flows a stream called "Acquataccio" or Marrano della Caffarella, or the ancient Almone river, and slightly goes up after the curve of the "Domine quo vadis" church; a first fifth of the hill that goes down towards another trough is occupied by the complex of the catacombs and of the Basilica of San Sebastian on the right and by the Massenzio circus on the left of the same trough. The road layout is the mirror of the morphological aspects of the place.

The various levels of the Appia depend on it; the troughs and straight ways are a result of the composition of the land.

As already affirmed, the hills around Rome are made of exploited and excavated layers of tuff that often form dense tunnels that intersect each other; like for the tunnels of the catacombs. This intersection is also present in the complex of Massenzio area.

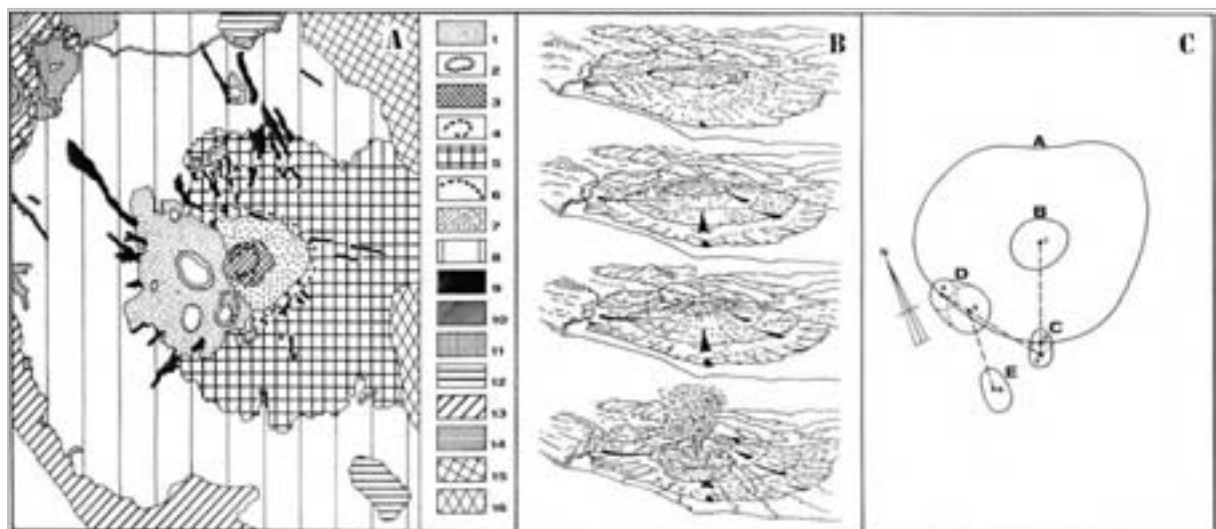

Fig. 7: The genesis and geological characteristics of the area of the volcano of the Lazio region from a "Plan for the Appia Antica park", A: geological map of the volcanic apparatus of the Lazio region and its adjacent areas, B: reconstruction of the major episodes in the history of the volcano of the Lazio region, C: diagram, according to Sabatini, of the subsequent movements of the eruption axis.

On both sides of the Circus, there are two small hills on the right, there is the one that is occupied by the ruins of the Imperial Palace, of tuff nature, and that stretches all the way up to the tomb of Romulus.

Here, repeated earthworks were carried out, which is why there is a difference in height between the "quadriportico" and the villa. The hill on the left, on which the tomb of Cecilia Metella is located, is formed by the foothills that were made by the enormous lava flow of Capo di Bove. The entire area can be visited through the straight path of Via Appia. However, Via Appia Pignatelli.

1.3 The vegetation

The Roman landscape and, especially that of the Appia Antica, has always been described by writers and painters as being full of vegetation. It is one of the most complex and interesting examples of respect for nature. The beauty of the sacred woods of the Dea Egeria and of the Muses, but also of many others remembered for the richness of the species that distinguished them was the recurring image that was imprinted in the hearts of travelers who followed and visited the shrines and tombs that were surrounded by lush trees.

The close relationship between the presence of special types of vegetation and of archaeological ruins was confirmed numerous times and it can therefore be considered an effective tool; both for the identification of artifacts and for the thematic development of the same. The morphological transformation of the Appia has influenced the transformations suffered by the vegetation: the original vegetation was characterized by the presence of woods of turkey, mixed oak forests and holm oak woods. In the damp areas of the ravines, there were alder and willow forests, whereas on the more hilly areas, the Mediterranean scrub was present. Today, vegetation as a whole is rather reduced.

From direct observation, specific issues tied to the area of study have emerged and also concern its surroundings: the first negative aspect concerns the level of degradation of the landscape of the Appia.

This degradation occurred over the years because of property speculation, but also because of poor land management and misuse. Indeed, this lack of attention to the protection of its nature led to an uncontrolled use of the land. Therefore, the original landscape is no longer visible.

The soil represents an essential resource for the territory, development and quality of the vegetation as it depends on it. Identifying and maintaining its original structure and quality can facilitate the requalification of the area; identifying the "vocation of the land" in order to strengthen the structure is essential. An investigation and accurate survey of the land and the existing vegetation can serve as the base of a sensitive and accurate project of requalification.

The area of the complex of Massenzio is occupied by cultivations that could be considered as being natural ecosystems that need to be maintained and developed. For this reason, very natural vegetation can be seen in the ruins of monuments, on the margins of hedges and along the natural irrigation systems. In these areas, the turf has very interesting features and aspects from a vegetation viewpoint, but also from a scientific and educational one. It represents a collection of important species from an ecological and evolutionary perspective.

An accurate survey and detailed cataloging may also determine the guidelines of the requalification process for the archaeological areas found within the Park of the Appia Antica.

The recomposition of the natural system can be conducted at the same time as the operation aimed to reconnect the archaeological system through timely, visual, historical and scientific dialog amongst the elements.

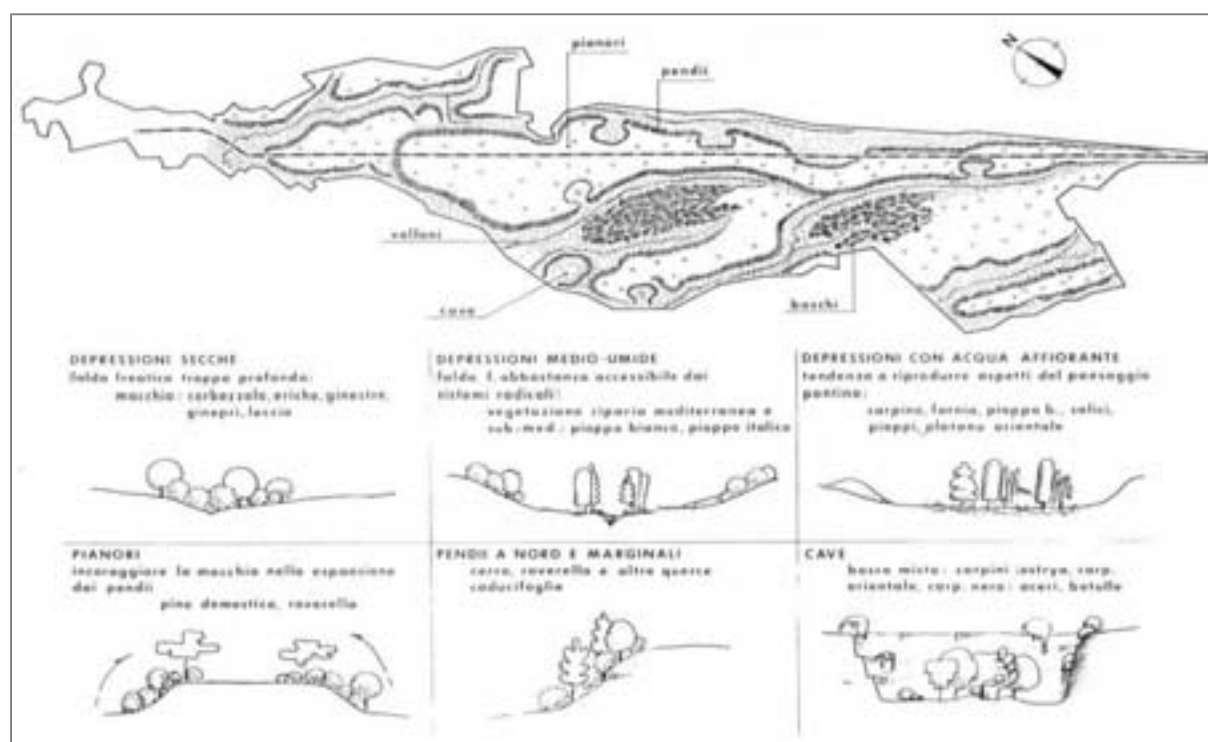

Fig. 9: Criteria for the reconstruction of the vegetation from the "Plan for the Park of Appia Antica".

2. The historical and archaeological development

Via Appia is almost entirely an artificial road that needs continuous and timely maintenance in order to keep its undoubted historical and environmental value. The complexity and diversification of the remains of the ancient structures draw attention towards more general issues linked to land management. Already Raffaello, Pirro Ligorio and other famous personalities of the Renaissance focused on the preservation and control of the Via Appia Antica by preventing vandalism.

Even in the eighteenth century, the abandoned and deserted street and its landscapes were described in a romantic manner through the poems of its visitors, who emphasized the charm of the ruins.

However, it is the most ancient one and also the most famous in terms of its history, the beauty of the surrounding landscapes, its evolution and the archaeological evidence it withholds. Its history is clearly divided into two very different realities. The two fronts are different from one another for their natural and archaeological aspects. This richness requires an accurate action of development. Its history must be understood through a timely path with stops to emphasize the value of the archaeological remains.

The tomb of Cecilia Metella has always been of main interest both for its grandeur and strategic location. Its history represents a simple tool of dissemination, which has often led others to forget about its surrounding areas, such as the complex of Massenzio. During the late ancient period, the complex of Massenzio ownership was passed down to the church. Since the street and surrounding artifacts fell into ruins, there is evidence of a description called "findus tertius" in a deed.

Throughout history, the circus, as well as a greater part of the complex, was named in a different manner on several occasions; in the map of Rome and of the Roman Countryside, the area was called "hippodromus" and the tomb of Cecilia Metella, "Capo di Bove", like in the map of Eufrosino della Volpaia in 1547.

In the second half of the 1500s, various excavations were conducted by the Matteis in 1550 and by the Ippolitos d'Este in 1560 in the Massenzio area. The important transformations and discoveries were documented and inscribed on the maps in various time periods.

For example, in 1825, Nibby excavated the spine of the Circus, which was then owned by the Torlonia family and the map of the area containing the Circus was called "the carousel".

A greater part of the archaeological and historical evolution can be deduced from the data recorded during the excavations and from the expropriations that were put into practice from time to time. Therefore, a comprehensive chronology of the historical events that occurred was recorded.

For example, after the expropriation of the papal monuments that were very close to the side of the street, the only monuments that were acquired as a public good - by the Municipality in 1940 - was the complex of the Tomb of Romulus and that of the Circus of Maxentius.

Highly valuable monuments are still to this date within private properties. Monuments such as the Casale della "Giostra" cannot be visited. Often, the "deformation" and boundaries of an area, such as the Massenzio one can no longer be included as a whole; therefore losing its identity and value.

2.1 The history of the artifacts

A source of the fourth century AD, the Chronograph of 354, lists the works that were carried out on the complex of Maxentius during his short reign (306 - 312 AD). This record reported that the emperor had had a "catecumbas" circus built to create tunnels within the caves to extract the pozzolana present in the area. This record was lost over time and the Appia circus, investigated and reproduced in the fifteenth century, was commonly attributed to the emperor Caracalla based on the news of its discovery. At the ruins, statues, portraits of that emperor and his mother Giulia Domna and an inscription dedicated to the young Romulus, son of the emperor Massenzio, were found during the excavations conducted by the Torlonia family and managed by the archaeologist Antonio Nibby in 1825. The layout of the circus and the imperial palace, already known in other tetrarch residences (Antioch, Milan, Trier) is enriched, like in the palace of Galerius in Salonica, by the presence of a dynastic mausoleum that becomes the central element of the entire complex.

The architectural forms turn into majestic and essential bodies that complete each other although interdependent at the same time. The elements are well-designed. The technique commonly used in the fourth century is the "opus vittatum" that alternates ordered files of tuff blocks and bricks. The rest of the Massenzio constructions are configured as the last act of the transformation. Indeed, they concern the transformation of a rustic Republican villa (second century AD) built in a scenic location, on the slope of a hill facing the Alban Hills.

After a period dating back to the first empire, in the second century AD, the villa underwent a radical transformation under the supervision of Erode Attico, the Greek rhetorician to whom the property was given as a dowry by Annia Regilla. He transformed the entire area into a sanctuary called the "Pago Triopio" in memory of his wife after her tragic death. The three buildings were built to support, very wisely, the natural topography of the area as to avoid - as much as possible - big excavation and filling works while taking advantage of its characteristics.

Thus, the palace was built on the remains of the previous construction and the circus therefore stood towards the East and West, in the valley that gradually goes up towards the current Via Appia

Pignatelli from the Appia Antica. The lack of direct sources on the area from the late Middle Ages lets us assume that the factories were attached to the properties of Constantine and that they were passed to the church. Therefore, from the sixth century, they at least became part of the Appiae Patrimonium. Constantine made the same construction to build the first basilica with apsidal halls and aisles. It was later dedicated to San Sebastian.

The area concerning the memory "apostolonim ad catacumbas" is often interpreted as a Christian contraposition against the monuments used to celebrate the figure of a pagan emperor.

A document from 850, which was preserved in the sublacense archive, reconfirms the ecclesiastical ownership of a land at the second mile of the Via Appia. In it, there are ancient structures in ruins called the "parrionis" that make it possible to recognize a locus qui dicitur girulus (the circus) and a curtis quae vocatur maruli (the area of the mausoleum). The land was defined as being arable and bordered with gardens and vineyards. It was irrigated by a major stream that flows through the area; like a sign of reunification with the Via Appia, an arcus maior iuxta silice publica is cited.

In 1081, a part of the circus was then owned by the Basilica of San Paolo f.l.m., while the area of the palace was given to the counts of Tusculum. In the first half of the twelfth century, these buildings - even if not attributed to Massenzio - were inserted in the Mirabilia Urbis for how majestic they were. In the following centuries, the information found on this area is extremely sketchy: in the fifteenth century, the circus was always referred to as girulus, while the estate of Capo Bove, owned by the Hospital San Salvatore ad Sancta Sanctorum, started to take shape. Later, it would also include these monuments, which got even more subdivided amongst different owners, making it very difficult to identify the heirs (Cenci, Mattei, Leni, Mutini, etc.).

While owned by Cenci, he had an access gate to the area built. This door consisted of two rooms on the ground floor for the guards and of an upper floor; today, this structure still houses the ticket office of the archaeological site. A chirograph dated 1648, states the pope Innocenzo X ordered the transfer of the obelisk of the circus which was still owned by Cenci. At this time, it was broken into multiple fragments to build the new fountain of Piazza Navona.

In the seventeenth century, the name "carousel" was used to refer to the structures of the circus. This name was therefore extended to the entire area North of the Via Appia Antica. At the beginning of the nineteenth century, the ownership was even more fragmented while the tomb of Romulus was now owned by Monsignor Fabio de Vecchis. The area of the "carousel" was owned by the Giorgi family and right after, the circus area and later the mausoleum were bought by the Torlonia Dukes of Bracciano.

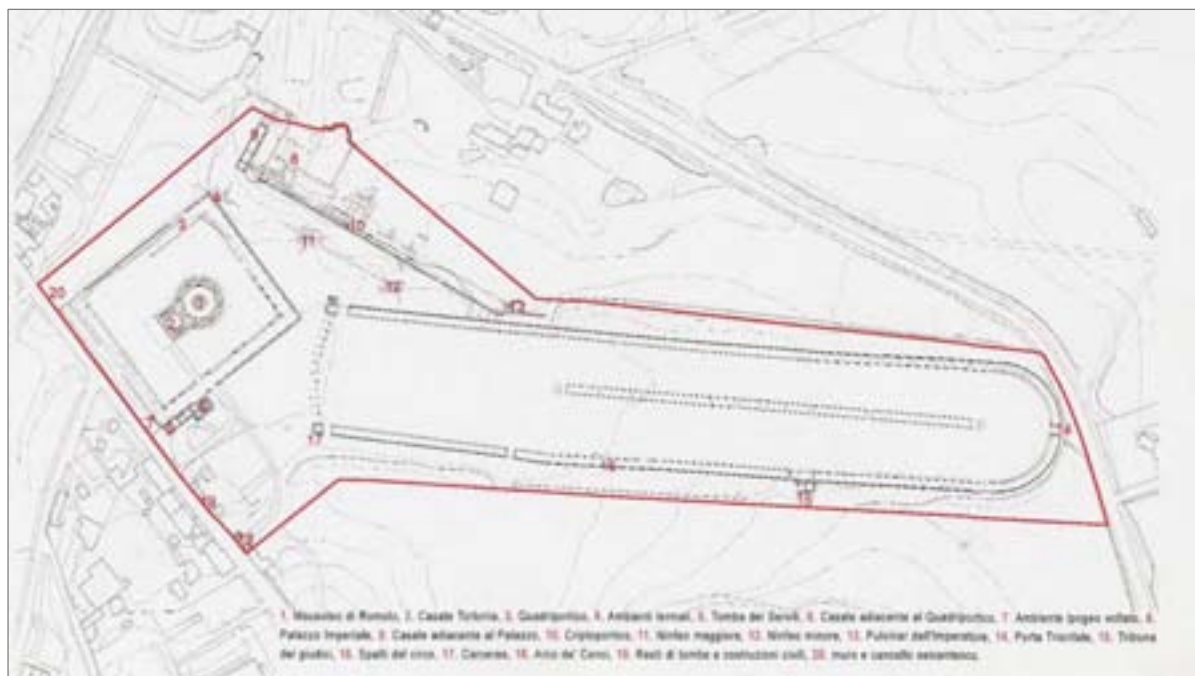

Fig. 10: Description of the existing building structures: floor plan of reference:

1 - Mausoleum of Romulus, 2 - Casale Torlonia, 3 - Quadrangle, 4 - Thermal Environments, 5 - Tomb of the Servili family, 6 - Farhouse next to the "quadriportico"; 7 - Vaulted underground environment, 8 - Imperial Palace; 9 - House adjacent to the Palace, 10 - Cryptoporticus; 11 - Larger nymphaeum; 12 - Smaller nymphaeum; 13 - Pulvinar of the Emperor, 14 - Triumphal Gate, 15 - Forum of the judges; 16 - Stands of the circus; 17 - "Carceres"; 18 - Arch of the Cenci family, 19 - The remains of tombs and civil constructions; 20 - wall and gate from the seventeenth century.

2.2 Research project and archaeological excavations in the intervention area

The Municipal Superintendence already has projects of redevelopment and enhancement in progress for the archaeological area of the Villa of Massenzio.

Such projects concerned and still concern the mausoleum and circus buildings. Currently, the palace, erected on the Massenzio terrace North of the circus remains in a decentralized position with respect to the Tagliacarne Institute near the Via Appia Pignatelli. At this point, resuming research in the area of the palace, which was excavated in the 60s of the last century by the Division X and the Institute of Roman Studies thanks to the funds provided by the CNR, appears to be useful.

Such research made a unique contribution to the knowledge acquired on the evolution of the system of the suburban villa from the Republican and Imperial era; a real imperial palace of Tetrarch origin. Further research opportunities must now revolve around the definition of all the building components found on the main terrace and on the territorial boundaries lying North and East of the same palace.

As far as the circus is concerned, the supply of the tanks of the eutripus should be checked.

A systematic internal and external check of the hemicycle at the base of the triumphalis door should shed light on the entire system of water adduction that must be followed along the spine. While the work is being carried out, we should eventually decide whether or not to make an assessment of the North tower where there are traces of a water collection tank (G. Ioppolo).

Two subterranean rainwater collection system will be investigated in the area in front of the "carceres". Near the pulvinar, we should also implement keys to study the ancient water drainage system in the area of the circus in view of a possible recovery. The location of these studies will be defined while work is in progress.

On the outside of the circus, we will implement the required tracks, or appropriate excavations to reduce the soil pressure on the ancient walls until reaching a flat surface along the entire parameter before proceeding to arrange the area in a natural manner.

Inside the circus, we will maintain the current dimensions of the system to make sure they correspond to the original surface of the track. We will however check the surface along the entire perimeter of the podium.

Fig. 11, 12: The remains of the pillars of the arches of the "carceres" taken during the 1992 restorations - View from the South. The remains of the pillars of the arches of the "carceres" taken during the 1992 restorations - View from the North.

This preliminary environmental requalification project and the development of architectural enhancement is composed of many other in-depth studies that we cannot document here. The objective of the work was to define our knowledge of all the architectural components of this archaeological area, to highlight the relationships and the original plans and to proceed to a final system with appropriate itineraries for visits, but to also enhance the archaeological findings in consideration of the natural and environmental elements involved.

Abstract

The material survey is a crucial component for the restoration and conservation of the architectural heritage, which can give information for the definition of the project.

The intention of restoring critically architectural reality, through the material survey, in fact, need graphic devices to highlight information not always visible by direct observation or photography.

Highlighting, for the walls, the marks of stone processing, the lithological nature of the materials, the construction discontinuities, the difference in construction techniques, it is possible to formulate the chronology of the structures, realizing that the artifact is an "architectural palimpsest", ie a set of complex layers.

This paper illustrates several material surveys regarding the walls of the city of Benevento, made with the aid of the direct survey and, subsequently, with drawing and graphic processing software.

With the aid of mensiochronological analysis it was possible to highlight the different materials used and the wall layers, distinguishing the stages of Longobardic Age from those of the Modern Age and the additions by the recent restoration works.

To establish, inter alia, an efficient tool for professional activity, the experience has given, due to its critical nature, a significant contribution to the knowledge of the walls of Benevento.

Keywords: conservation, mensiochronology, material survey, city of Benevento

1. Introduction

During the Course of Architectural Restoration held by Professor Luigi Guerriero – which is part of the Master of Science in "Architettura e Ingegneria Edile" of the Second University of Naples - the students carried out a material survey of the defensive walls of Benevento. Each student was assigned a wall segment and a tower and given study material consisting of a selection of the scientific literature on the topic and a topographic survey of the urban walls.

First, the students have carried out the survey of the segments and then they have used graphics editing software based on the principles of projective geometry. In this way they have developed material surveys in vector form, which allowed a critical analysis of the city walls. The stratigraphic analysis of the walls was mainly based on well-known research protocols, which allow the dating of the structures depending on their configuration. This approach revealed the materials used and their stratification and allowed the identification of various phases (Longobardic Age, Late Medieval Age, Modern Age and additions due to recent restorations), significantly increasing the knowledge of Benevento city walls, which are the product of a complex evolution.

2. Historic and urban overview

As is known [1], the defense system of Benevento - analysed in this paper - is mainly related to the gradual crisis of the Roman world in the Late Antique period. The settlement founded in the III century B.C. - which extended lengthwise along the NW-SE direction - was presumably situated between the bight of the river Calore, beyond the Cellarulo quarter (NW), and the area of the S. Sofia complex

(SE), following the orography of the site, characterized by natural terracing. The urban structure - typical of the Roman Age - was made up of NW-SE oriented *decumani* and *cardi*, which formed *insulae* about 35x70-100m large.

Signs of the urban structure dating back to the Roman Age can be found both inside and outside the city walls. Among the many *intra moenia* evidences, there are the theatre, in the south-western district, the Arco del Sacramento, a thermal complex found nearby the cathedral, the Arco di Traiano and the ruins of the aqueduct, incorporated in the Rocca dei Rettori (XIV century), on the eastern border of the city. Among the *extra moenia* evidences, there is a building nearby the river Calore - perhaps a cryptoporticus - in the Cellarulo quarter, and the ruins of the amphitheatre nearby the river Sabato.

During the Classical period, the main access to the city was on the Appian Way, whose urban route was subjected to slight modifications until the IV century A.D. In the final configuration, it led to the city through the Leproso bridge, which crossed the river Sabato and roughly followed the route of today's Corso Dante and Corso Garibaldi, up to the Rocca dei Rettori. During the Imperial period, the Via Traiana - which led to Benevento through the Arco di Traiano - was built alongside the above-mentioned path.

The crisis in the Late Antique period, caused the abandonment of a great part of the Roman settlement, which, at the time, was protected by smaller city walls, presumably built in the IV century. Fragmentary elements of such walls can be found nearby the Arco del Sacramento, together with the pentagonal salient made up of large reused limestone blocks, which was adjacent to the arch. The above-mentioned defensive perimeter - greatly damaged in the first half of the VI century, during the Gothic Wars - was rebuilt by the Longobards in the VI and VII centuries [5].

At an early stage, the Longobardic city was confined within restricted boundaries, with the city's western district corresponding to the current Cellarulo quarter - where the structures of the amphitheatre were cut in height for strategic reasons - remaining out of the defensive perimeter, together with the southern urban area - where the theatre was - which, nonetheless, kept its use, as evidenced by recent archaeological research [1]. It was after the fall of the *Langobardia Maior* at the hands of the Franks, that Benevento assumed a central role in the organization of the surviving Longobardic power in Italy, embodied in the figure of the Duke Arechi II. At the end of the VIII century, he gave birth to a great program of renovation and expansion of the city, which mainly regarded the south-western and north-eastern urban districts and improved the defense system in order to contrast the dreaded threat represented by the Franks. Such program was put into practice with the annexation of the *Civitas Nova* and the building of monumental complexes representing the city's power: the *Sacrum Palatium* on the Piano di Corte and the S. Sofia palatial church.

In the Late Middle Ages, after Benevento was reduced to the rank of pontifical enclave, isolated within the Kingdom of Sicily, the rectors' seat (Rocca dei Rettori) was built nearby the Porta Summa, and, until the XIX century, it represented the eastern border of the urban expansion and a cornerstone of urban defense structures [3]. Important works of reconstruction of the residential area and of the walls - which had been necessary due to war damages and damages caused by the several earthquakes that stroke the city - date back to this period.

In the Modern Age there have been devastating earthquakes in 1688 and 1702, which encouraged a further renovation of the buildings and extensive reconstructions of the city walls, supported by the archbishop V.M. Orsini and directed by the architect C. Buratti [2] [3] [4].

The main transformations of the Modern Age - recorded in the local topography, starting from Casselli's map of 1781 - regarded, among other things, the gradual occupation - especially in the northern district - of the areas close to the walls, which were incorporated in the houses, and the restoration and partial reconstruction of some greatly damaged sections of the fortification, especially on the southern side.

In the second half of the XIX century, significant alterations of Benevento's historical centre took place - according to the general city planning trends widespread in Europe at the time - with extensive demolitions of the city walls and buildings for the construction of new roads or the expansion of those already existing. At the same time, an *extra moenia* expansion took place outside of the demolished Porta Rufina, on the southern side, and around the new train station, on the northern side.

In the aftermath of World War I, the city plans encouraged the development of new roads to the detriment of the historic buildings, and the building of new residential areas east of the fortified centre and in the residual empty areas nearby the Torre della Catena. World War II and the following reconstruction caused enormous damage, altering the environmental context of the city walls. Further alterations have been caused by debatable interventions during the last twenty years.

3. Mensiochronological analysis

The material survey of large segments of the city walls - which can be observed in the images - and the mensiochronological analysis have showed significant differences in constructions and a stratigraphic complexity of the structures greater than observed by past studies.

Firstly, only some segments can be referred to the Longobardic Age. These are built with river pebbles and a great quantity of reused materials, such as limestone blocks of considerable size (*spolia* from Roman monuments in *opus pseudoisodomum*, like the theater or the amphitheater) and brick fragments extracted by breaking classic buildings. The structures of the Modern Age, instead - more numerous than the medieval ones - are usually built with “scapoli” of limestone and with “cantieri” of bricks, sometimes together with tuff of Campania and, finally, sandstone, an easily available material in Benevento.

Walls dating back to the early Middle Ages can be found in the north-eastern, western and south-western part of the defensive system, corresponding to the curtain walls C3, C6, C9-14; in other sections, only the basements - as in the curtain wall C5, in the towers T9 and T11 and in the segments C12a and C13 - can be referred to the Longobardic Age. In these areas, the stone – which appears disorderly assembled, with a sequence of pebbles and limestone blocks considered illogical by the recent historiography - was used in a way that allowed the optimization of the construction timing and the site organization. In fact, the urgent need to set up an effective defense, in fear of imminent attacks, determined, in the first Longobardic period, the organization of a complex building site which involved all the construction sites in the whole city.

For this reason, many builders, supported by teams of transport workers, manual laborers and scaffolders, had to build individual segments of the city walls, facing the random arrival of stone materials collected from the beds of the nearby rivers Sabato and Calore - which converged on the site of Benevento - from Roman monuments in ruin and, to a lesser extent, from the ground.

As a result, the materials were not subjected to preliminary sorting and storage processes, but were used (basically following horizontal alignments) as soon as they arrived on the building site. The building process often involved the superimposition of considerably large and heavy limestone blocks on walls made up of small pebbles, giving birth to a specific wall type.

As mentioned before, the segments of Longobardic walls not altered by later interventions are set up following a typology called “a cantieri”. The “cantieri” had non-uniform height and were made up of irregular materials arranged by placing larger “scapoli” at the bottom and small irregular stones at the top of the horizontal alignments, as it was usual in this kind of structure [6].

In the segments dating back to the Longobardic Age, the height of the “cantieri” is frequently adjusted by placing large recovered blocks of limestone, apparently randomly arranged, but actually placed as regulatory elements of the alignments, in spite of the constraints imposed by the need to place them as soon as they arrived on the site.

Similarly, fragments of bricks are mainly used to fill the spaces between the larger stones. Some towers show a different construction technique probably due to the fact that they had to withstand greater stress during attacks. Thus, the square salient T11 is almost entirely built with recovered limestone blocks and alignments adjusted in height by corner elements. The river pebbles - when not regulated by the recovered blocks - are set up “a cantieri” with heights in the range of 22-28 cm and 33-43 cm, often together with brick fragments and erratic “scapoli” of sandstone as in curtain walls C13 and C18 and in the tower T11.

The parts rebuilt after the earthquakes of 1688 and 1702, located in particular in the south-western area, display walls made up of river pebbles and “scapoli” of cleaved limestone with inserts of sandstone, and more rarely of yellow tuff, with alignments of single or double rows of bricks, laid in 53-63 cm high “cantieri”, as in curtain wall C14c [3].

In addition, modern and contemporary buildings that have incorporated parts of the medieval walls show typical alignments with rows of “bozzette” in gray tuff datable to the XVIII century (tower T9, curtain wall C12a), rows of “blocchetti” of the same ignimbrite, dating back to the XIX century, and, rarely, limestone “blocchetti” of the late XIX century, as in curtain wall C5 [2] [3].

It should be finally noted that the stratigraphic investigation of the historical material is particularly difficult due to recent work carried out on the city walls, with the filling of the mortar joints which erased many “cantieri” with obvious detriment of the visual and cultural values of the monument. In addition to that, integrations to the walls realized with “scapoli” of limestone have been carried out for the entire extension of the urban walls, in disregard of the structures and of the context in which they are situated.

4. Conclusions

The archaeology of the urban walls, based on material surveys, has resulted in a significant increase in knowledge about the history of construction of the city walls of Benevento. It has also highlighted the survival of few early medieval parts and the repeated reconstructions and repairs of building curtains and towers, documented by the different materials and different construction techniques used.

Abstract

European metropolises are more than ever concerned about the rehabilitation and the staging of their built heritage. Built heritage is no longer limited to serving as a cultural symbol. As a result of culture-oriented urban policies, designed against the backdrop of globalisation, built heritage is increasingly considered as a resource of both economic and urban development.

Vienna disposes of extensive historic built-up areas (baroque era and late 19th century), which have been rehabilitated over the last couple of decades. The renewal, however, has soon taken on its own dynamism: the facades of historic districts are not only showcased by architectural lighting but they also find themselves utilized as sceneries for cultural events and Christmas markets. As a recognizable identifying symbol and an image builder, the city's built heritage is even used for urban development strategies and city marketing concepts. Hence, the "Imperial Vienna" theme has become the most important brand module in the city's own touristic marketing.

This paper aims to highlight the role of Vienna's past and its built heritage when it comes to urban development policies. Major issues discussed in this analysis are the objectives of the use of heritage and the prevailing mechanisms to be observed.

Keywords: Vienna, built heritage, urban development policies, international competition of cities

1. Built heritage as a resource for urban development policies

Built heritage is no longer limited to its cultural, representative function. European municipalities have recognised the importance of architectural monuments and historic districts for urban economy and development. Hence, they have made intense efforts to renew and to showcase historic buildings, which often have been neglected over decades. In the global competition between cities, European towns increasingly want to stand out for their cultural potential and their built heritage. Today rehabilitated historic districts staging cultural or sports events are considered as pillars of identity and image. By virtue of these qualities they are used as an instrument in the cities' efforts to attract tourists, skilled workforce, major events, investments, establishment of new companies etc.

The growing importance of culture and cultural heritage in the context of urban policies is attributable to the changing framework of urban development as well as to the necessity to provide new economic resources. Deep structural changes such as the economic transition from industrial to service-oriented, the advanced degree of globalisation, or the emergence of new communication technologies have imposed new challenges on European cities. While the cities' governments' primary obligation has been to create the preconditions for safeguarding jobs and demographic stability through industrial growth and mass consumption [1], they increasingly look for entrepreneurial initiative. They opt for large-scale projects and search to adapt to globalisation and to market-driven processes, always with an eye on their international competition, and put great emphasis on specialized location marketing [2]. In such an entrepreneurial or "post fordist" conception, an economy based on knowledge, creativity and culture are preferential fields of action -The reassessment of the "ancient European city", its virtues and its history are part of this approach [3].

Vienna, the Austrian capital, also ventures on its cultural richness and on the attractiveness of its built heritage. "Urban actors" have recognised - here again – the economic and especially touristic potential associated to a renewed and staged historic city. However, Vienna's reputation as an outstanding cultural centre is nothing new. What is new is the extensive employment of culture and cultural heritage for development issues. In many other places, this may well be considered as a result of the above-mentioned global economic and cultural trends, but in the case of Vienna a number of specific conditions add to this phenomenon. First and foremost, the geopolitical changes in Central and Eastern Europe during the last two decades. The fall of the Iron Curtain and the subsequent gradual enlargement of the European Union concluded a long period of isolation for the city sitting at the boundaries of "Western Europe". As a matter of fact, Vienna and its region have shifted back to the centre of Europe. Since then, the Austrian capital has been keen on developing into a centre for international

organisations and establishing itself as an important hub for business between Eastern and Western Europe. On the downside, the city is exposed to international competition, in particular with other central European cities such as Prague and Budapest – a competition which is increasingly led on a cultural-based level. In response, the former Habsburg residence strives to position itself as a “European cultural metropolis”, pointing out its origins, its centuries-long tradition and in particular the imperial history and the corresponding heritage.

The following chapters will focus on the role of built heritage within the Viennese urban development policies. A short retrospective view on the two most significant historical phases of urban development shall provide an insight into the built heritage of the city and its later reception. Subsequently, the employment of built heritage within urban development planning, tourism advertising strategies and the organisation of cultural events will be discussed, including an examination of the objectives behind these policies.

2. Vienna's built heritage

Vienna disposes of a vast historic building structure which mainly dates back to the baroque period as well as the late 19th century. In the following these two prosperous periods shall be discussed briefly.

2.1 The first wave: baroque period

The urban transformation of Vienna between 1680 and 1740 can be considered as a consequence of the countering of the Ottoman troops and the Counter-Revolution, both led successfully by the House of Habsburg [4]. The imperial residence's newly gained power as well as the renewed strength of the Catholic Church turned Vienna into a major centre of information, communication and culture [5]. Such a role required new representative buildings and infrastructures.

Although the urban transformation was initiated by the 'monastic offensive' in the wake of the Counter-Reformation [6], the overall restructuring of Vienna into a baroque town was mainly initiated by the arrival of noble families, who were attracted by the radiance of the city. Many existing buildings inside the ramparts were transformed into palaces, and splendid garden palaces were erected outside the city [7]. The Habsburg Family itself did not issue guidelines on the baroque urbanism but nevertheless put a lot of attention on the transformation of their own residential buildings. Lavish palaces such as Schönbrunn and numerous churches were constructed in this spirit. This way, the Habsburgs strategically employed baroque architecture to express their claim to power and their glory. On top of that, Vienna as the capital and imperial residence has been home to the crown of the Holy Roman Empire of the German Nation since the 16th century, stipulating it as Rome's natural inheritance and the symbolic concentrate of the Habsburg Empire. These ambitions are particularly obvious on the St. Charles Church built between 1715 und 1738 by J.B. Fischer von Erlach. The church's facade (Fig.1) reveals During the following century baroque architecture was widely rejected as “overloaded”, “bizarre”, “eccentric” and “degenerated”[9].But it was only at the time of the urban transformations of the late 19th

Fig. 1: St. Charles's Church as a landmark of absolutist imperial power (photo: author)

century which had resulted in the demolition of a major part of the baroque building stock of the inner city, that this style was seriously reconsidered. Baroque architecture became again popular at the Viennese court who, striving to regain political influence within Europe, was interested in a cultural demarcation from the German Empire. In this light, the feudal, absolutist and catholic coding of the baroque architecture, together with its association with the “golden age” of the Habsburg Empire played an important role [10]. Baroque and neo-baroque architecture was then even chosen as the “national architecture style” of Austria. The full rehabilitation of baroque architecture took place during the first half of the 20th century. In the interwar period as well as after 1945 it was used by the public administration as a projection surface for the national identity [11] of a strongly reduced and thus redefining Austria.

2.2 The second wave: late 19th century transformations

The second significant period of urban and architectural development in Vienna was that of the late 19th century. Industrialisation and population growth (the Viennese population rose from 900.000 up to 2 mn. between 1870 and 1910) triggered an unprecedented modernisation of the old residence Vienna into a European metropolis [13]. From the 2nd half of the 19th century on, urban authorities launched significant infrastructural and pan-urban projects. The driving forces behind these undertakings were no longer the nobility or the church but the capitalist economy and an emerging bourgeois society [14]. At that time Vienna was not only the imperial residence but also a major administrative and economic centre and financial market place. Moreover, it was a main traffic junction within the Austro-Hungarian Monarchy [15]. All these evolutions were reflected in the new cityscape.

The old baroque city centre was replaced by a modern business district with multi-storey buildings designed in a historicist architectural style [16]. The building stock of the former suburbs was also demolished for the most part and replaced by higher tenement buildings. Just like in Haussmann's Paris or in Cerda's Barcelona, design and measures of the building complexes were subordinated to standardising technical and architectural guidelines.

The starting point of the so-called Viennese Master Plan of the late 19th century was a ring avenue (Fig.2) situated on the site of the former ramparts. The road was meant to join the city centre with the suburbs and to favour the extension of the overall road network. Along with its structuring function, this magnificent ring boulevard originally was to serve as a medium to express the sovereign status of the Habsburg dynasty. However, after its completion in the beginning of the 20th century, the Ringstrasse, hemmed by public institutions such as the University, the Parliament, the Stock Exchange but also bourgeois palaces, represented less an imperial gesture than a demonstration of the growing influence of a new liberal elite [17]. The only urban intervention from the already weakened imperial

Fig. 2: Inner city of Vienna with the area around the Ring avenue with its mighty 19th century buildings (map: author)

court was the construction of the imperial forum (fig.2) which crosses the Ringstrasse at the level of the imperial residence. The forum whose architectural conception referred to the forums of the ancient Rome [18] was never completed and remains until now as torso-like entity.

As far as the later reception is concerned, the historicist built heritage of the late 19th century including the Ringstrasse were disliked by architects, art historians and a major part of the Viennese society until the 1970s. In the course of the post-war reconstructions the urban fabric of the late 19th century had to be restored, however, it was common practice to remove the ornamental facades in order to achieve plane and bare surfaces [21] according to the then predominant architectural functionalism. As in many western European cities, Viennese development policies gave then priority to the urban extension at the outskirts of the city. This tendency caused the decay of the inner city and a rise in vacancy rates [22]. Nevertheless, the rejection of the principles of the “functional city” in the advent of the cultural phenomenon of postmodernism at the end of the 1970s turned the “old European city” into the new leading principle. This resulted in a comprehensive “return” to built-up areas of the 19th century and in an appreciation of its urban and aesthetic qualities. Today the Ringstrasse and its representative buildings are considered as a piece of art, as a place of collective memory and identity as well as an asset which contributes significantly to the force of attraction of Vienna [23]. Since 2002 the city centre and the area around Ringstrasse figure on the UNESCO World Heritage list.

The built heritage of both, the baroque era and the late 19th century, are now continuously rehabilitated as part of an overall renewal policy which has been effective since the late 1970s.

3. The contemporary use of built heritage in Viennese development policies

Evidently, both the baroque as well as the 19th century legacy became a recognized cultural heritage only after a long period of rejection and neglect. The sole rationale behind transforming it into cultural heritage were contemporary political needs. Clearly, cultural heritage is not something naturally given but constructed from the perspective of the present and always associated with the current needs. In the 18th and the 20th centuries these needs were of political and ideological nature, whereas today they are mainly economy-driven.

3.1 Built heritage as a pillar of identity and image in urban development planning

The most important documents of the Viennese urban development planning are the “*Urban Development Plan 2005*”, also called „*STEP 2005*“ [24], and the „*Strategic Plan for Vienna*“ [25] from 2004. While the first one is meant to provide guidelines for the spatial dimension of the urban development in terms of economic, social, demographic, ecologic and cultural aspects, the latter aims at positioning Vienna in a national and international context and provides impetus through strategic projects. Both plans reflect the striving for transformation of Vienna into a modern metropolis; they reveal the ongoing structural changes, in particular concerning the tertiarisation of the economy and they take into account major infrastructural projects. Within the envisaged urban development policies, culture and cultural heritage gain in meaning as they constitute a strong element of the urban identity. Additionally, they are able to underpin a positive image of the city in the international context. As such, culture and heritage are considered to form a new basis for urban economy.

“Architecture and urban design” is one of the 9 fields of action within the „*STEP 05*“ document (concepts of regional development and strategies, regional development model, housing, economy and employment, green and public spaces, spatial and temporal priorities of urban development, areas for major urban projects, spatial model of the urban development). Under this heading a special importance is ascribed to the built heritage of the city. Special emphasis is put on the densely built-up area of the late 19th century and the Ringstrasse, which are considered as the “most characterising and identity forming elements of the cityscape”. Some former suburbs show baroque or early 19th century town-centres, which are also pointed out as “particularly attractive” features and “unexpected” elements contributing decisively to the uniqueness and the distinctiveness of Vienna. Moreover, the restored built heritage stands for the city’s high living quality and adds to Vienna’s attractiveness for inhabitants and tourists as well as for potential investors and skilled workforce to be recruited.

In addition to that, the 19th century areas are viewed as a potential field for new economic developments in continuation of existing activities and expansion possibilities. This is especially true for growth industries such as business and legal services, healthcare clusters and creative industries. The “specific, non reproducible locational advantages” of these areas are considered as a “unique selling position” in the international competition for new business establishments.

The „*STEP 05*“ document repeatedly underlines Vienna’s position as an “international cultural metropolis”. The cultural aspect, in connection with its built heritage, is of utmost importance for the local tourism industry. The historic core, the Ring avenue zone as well as the Schönbrunn Palace are considered as the most important touristic assets of the city. The plan recommends protecting these areas, while at the same time avoiding their “musealisation”.

Moreover, the Viennese historic urban environment is viewed as a location factor for business tourism, congresses- and trade fairs. For the further development of the different tourism segments „STEP 05” recommends to stage the historic architecture, to increase attractiveness of the revitalised historic areas outside the city centre and to promote festivals and large-scale sports events [26].

In the „Strategic Plan for Vienna” built heritage is considered as a “symbolic location factor” and as an indispensable element in the context of Vienna’s image as a “European cultural metropolis” and a “city of architecture”.

3.2 Built heritage and tourism advertising: Vienna as an „imperial city“

The functionalisation of built heritage is even more obvious when it comes to tourism advertising. For this purpose, heritage becomes a “natural” resource that fosters the attractiveness and the uniqueness of the city. Tourism is the fastest growing economic sector of all in Vienna. It is linked with a large turnover of goods and services and it creates jobs. It is worth mentioning that the number of employees in the tourism sector doubled between 1990 and 2010. During the same period the number of overnight stays has increased by a similar account [27], and the number of beds provided by hotels and guest houses increased by 30%, leading to an increase in total revenues within the hotel industry at a similar scale. About 12% of the total number of overnight stays is attributable to congress tourism which traditionally has been a major economic factor [28].

Official tourism promotion is conducted by the *Vienna Tourist Board* [29]. The main tasks of this official body are the support of Vienna’s touristic affairs by means of marketing activities, a continuous development of the Vienna destination and of the “Vienna” brand. In 2011 the budget for the tourism advertising amounted to 22.6 mn EUR [30].

The current „Tourism Concept Vienna” [31] was prepared in 2009 in cooperation with members of the city government and representatives from tourism, culture, traffic, marketing, media, etc. The overall goal of this concept was to achieve an increase in turnover by 100 mn EUR in the hotel sector (starting point: 487 Mio. € in the record year 2008) and rise in overnight stays by 1 mn (starting point: 10.2 mn in 2008) until 2015 [32]. The most important objective formulated in the „Tourism Concept Vienna” is to strengthen the international perception of Vienna as a tourism destination by “emotionalising image campaigns”. A positive image shall also be embedded in the inhabitants’ minds in order to mobilise them as “optimistic and charming hosts”. A new branding strategy (2009) was meant to shape the envisaged image.

As part of this strategy, the “Vienna” brand focused on culture and cultural heritage. This topic had been the result of an international market analysis, with the purpose of identifying the basic essentials of Vienna’s identity and differentiating them from less important elements. The results of this analysis were crafted into five major fields which constituted the five “brand modules” of the “Vienna” brand [33]:

1.	<i>Imperial heritage</i>	29.90 %
2.	<i>Profusion of music and culture</i>	21.40%
3.	<i>Savoir vivre</i>	16.30%
4.	<i>Functional efficiency</i>	16.30%
5.	<i>Balance of urban and green areas</i>	16.10%

„The imperial heritage and the associated sights are a mainstay of Vienna’s image“, says one of the official conclusions made by the *Vienna Tourist Board*. According to this assessment, sights like the baroque Schönbrunn Palace, the mainly baroque and neo-baroque Imperial Palace, the Ring avenue, Imperial Spanish Riding School and the gothic St. Stephen’s Cathedral have been identified as the most important brand drivers. With the aim to distinguish Vienna from other destinations through an “imperial” or “royal” heritage, the *Tourist Board* positioned these main attractions as “must-sees”, associating them “with their history (and their stories)” [34]. With this objective in mind, the advertising of the “must-see” sights follows the imperial narrative. Large sized pictures of the imperial sights kept in a slight golden tone are made up with so-called “communication squares” featuring slogans as: „Vienna, now or never” or „At this moment the Emperor is granting an audience at the Vienna Hofburg. Don’t keep him waiting!” A distinctive word/image brand combination shall be created this way [35].

Fig. 3: The stage of the „*Vienna Festival*“ in front of the neo-gothic City Hall (photo: Mike Ranz / Wiener Festwochen)

In 2011 the “Vienna” brand was ranked 9th among 50 cities worldwide as analysed by Anholt-GfK Roper City Brands Index [36].

3.3 Built heritage as a distinguishing attribute for major events

In Vienna cultural events do not only aim to maintain traditions and to serve the requirements of a bourgeois elite culture. The current proliferation of cultural events in the public space of the historic districts is an expression of urban strategic considerations. Built heritage forms the spatial frame for cultural events, Christmas markets, open-air cinemas etc. It even becomes a part of the event. On the other hand, built heritage gains attention through events and special illuminations. Indeed, cultural events and built heritage stage and upgrade each other mutually.

Cultural events are to serve the image of Vienna in an international perspective and they are to boast the city as a vivid and attractive tourism destination [37]. The distinctiveness of the Viennese events from similar events in other cities is a major factor in this context. The production of historical atmosphere by using the “scenery” of illuminated historic facades turns fairly common events to unique happenings, typical of Vienna. Two of the most prominent “event locations” shall be discussed briefly. Doubtlessly, the most important location for cultural and leisure events is the square in front of the Vienna City Hall besides the Ringstrasse. For the “*Ice Dream*”, scheduled at the beginning of each year, the square is transformed into a huge ice-skating rink (1,800 sqm). The average number of visitors every year is 130,000 visitors [38]. In spring, the Opening concert of the “*Vienna Festival*” follows, reaching a global audience thanks to the Europe-wide television broadcast by more than a dozen international TV stations (fig.3). In summer the square turns into an open-air cinema for the “*Music Film Festival*”. Operas and concerts are projected on an oversized canvas situated in front of the main façade of the neo-gothic City Hall. Framed by numerous food stands offering culinary delights, the cinema presentations attract 700,000 visitors a year [39]. During the weeks before Christmas the square hosts the Christmas market “*Vienna Magic of Advent*”, which transforms the area into a “shining fairytale land” [40]. The market has been initiated in the middle of the 1980s by the City Council with the aim to attract more tourists in the months of November and December. In the meantime, this Christmas event has become a major economic factor which accounts for more than 3 mn visitors [42]. Every year, the City Council invests approximately 1 million Euros in this event [41].

Thanks to the above-mentioned highlights and numerous other events, the City Hall square is staged during the entire year.

Another prominent example for the citystaging its past and its heritage is the “*Summer Night Concert*” performed by the Vienna Philharmonic Orchestra in the gardens of the Schönbrunn Palace (fig.4). The concert is hosted by the City Council of Vienna, the Federal Government of Austria and sponsors as such as “Rolex” (since 2007). Labelled as “musical greetings from Vienna and Austria” [43], it is broadcast by the European Broadcasting Union and other international TV stations in more the 60 countries. The concert is frankly advertised in context of the historic ambiance of the location : the Vienna Philharmonic Orchestra “wishes to provide all Viennese, as well as visitors to the city, with a special musical experience in the impressive setting of Schönbrunn Palace and its beautiful baroque

Fig. 4: The “*Summer Night Concert*” inside the Schönbrunn gardens (photo: Richard Schuster © Wiener Philharmoniker)

gardens, a UNESCO World Cultural Heritage Site” [44]. The staging of the baroque palace is everything but a subtle hint to the imperial past of Vienna which can be actualised, at least symbolically, by events like this.

4. Built heritage as a major instrument of urban competition

The integration of built heritage into urban development plans, its use by the tourism promotion as well as the mutual staging of cultural events and built heritage show that local heritage has become a major resource of economic and urban development strategies. In the respective documents the Viennese built heritage is closely associated with the identity and the image of the city. In context with the international positioning of Vienna, a rehabilitated and staged heritage is viewed as a location advantage as it constitutes a strong means of differentiation and as it stands for a high quality of life. For touristic marketing of Vienna built heritage represents a major resource which is exploited in connection with the cultural but also with the symbolic economy.

The use of heritage as an image-building medium, as an instrument of differentiation but also - and especially - as a tool for city branding form part of the symbolic economy. The symbolic economy aims to intertwine cultural symbols with global economic capital [45]. The branding process combines the historical cityscape of Vienna with the narrative of the “imperial Vienna”, which is ultimately condensed to visual images and transformed to the global cultural product “Vienna”. It is the transformation from the local cultural asset into the consumable global product which makes the Viennese built heritage a strategic instrument within the competition for financial investments, skilled workforce, tourists, major events and for the revalorising of urban property. This reveals that the competition between cities based on culture is in essence a competition in the spheres of political and economic power [46].

Yet it is to underline that in the context of the contemporary applications mentioned above, the historic built environment of Vienna is not perceived as a heterogenic, multilayered legacy from the past with its complex context, its contradictions and its “dark sides”. The past and its material inheritance are wrapped into a narrative: they are simplified and transformed into a new “imperial” past. – This simulacrum has become a popular replacement for a lost history and responds to the requirements of the present, namely competitiveness and marketability. The imperial topic is suitable as historical references correspond to the postmodern representation of the “old European city” and to the idealised version of urban culture.

On an international level, the strategic efforts in connection with culture and cultural heritage are successful. Although it is difficult to measure the efficiency of employing culture and cultural heritage for urban policies, there is evidence that the international perception of Vienna is particularly positive. Statistical data confirm the policies applied by Vienna - in particular the tourism advertising and the branding policy. The income from tourism amounted to 3.5 bn EUR in 2011. In the same year Vienna counted 11.4 mn overnight stays, a number which exceeded the objectives set in 2009 (see above). Vienna occupies the 6th position among the top touristic destinations of Europe [47]. In the “Quality of

Living Survey 2012" carried out by the international Mercer Consulting Group, Vienna holds the leading position among 220 metropolises worldwide already for 4th time [48]. In the "Economist Intelligence Unit-City Ranking" of 2011 Vienna occupies the 2nd place among 139 cities in the world [49]. The survey quantifies the cities' liveability according to five broad categories. Culture is one of them.

However, the Viennese development policies are also to consider from a local viewpoint, beyond international positioning and competition. While the renewal policy of the 19th century zones and the highlighting of the historic structures as identity marks of the city can be valued positively, the use of heritage in connection with tourism advertising and the staging of the historic city by its "festivalisation" must be perceived critically. In the local context the city can obviously not be considered as a "product" or a "brand" but must be appreciated as a space of everyday life, of work and of informal social relations. Moreover, the city is closely associated to the concept of public space and to the related non-commercial activities, encounters and experiences. However, the use of heritage for touristic advertising and for the aesthetic framing of major events reduces certain urban spaces, in particular the historic inner city, to special nostalgic zones which stand out from the reality of the surrounding city. The touristic preparation, be it symbolic or material, and the constant "dramatisation" through cultural events is often followed by a commodification which means a loss of traditional functions such as administration, retail, business and local supply in favour of touristic, catering, cultural and leisure functions. Scholars have already observed such a development by for the inner city of Vienna: The transformation of a former political and administrative centre of European significance into a "postmodern leisure and entertainment city" are carried out "behind the historic facades and detached from the real historic conditions" [50] states the Austrian geographer Gerhard Hatz. The built legacy of this former centre has no longer a representative function but used in the context of the cultural and the symbolic economies [51].

Furthermore, the relevance of the "Imperial Vienna" narrative as an identifying feature for today's population has to be questioned. Focusing on the "imperial" image seems short-sighted in light of the multi-ethnic and multicultural reality of the city (already 44 % of the Viennese have an immigrant background [52]) and the aimed positioning as a modern European metropolis.

Instead, Vienna's built heritage is vast and multi-faceted. In deference to its historical reality, such a legacy requires a differentiated perception. A less focused and less simplified approach to this cultural heritage which is not subject to image-building purposes would provide the possibility of various types of interpretation and identification. Moreover, it would allow for a broader scope in terms of urban development, be it cultural, social, architectural or economic.

Turin for the French

Nadia FABRIS,

Dipartimento DAD, II Facoltà di Architettura, Politecnico di Torino, Italia

E-mail: Nadia.Fabris@polito.it, nad.fab@libero.it

The study started on deepening as travelers, through the diaries and travel guides, describing the city of Turin, Piedmont, Italy on which they focus attention emergencies, such judgments addressed the organization of the city and its urban fabric, which paths offer, and yet such cultural trends travelers express, what are the architectural presence, now disappeared, which testify to the existence and demonstrate the interest, which interventions and transformations taking place during a specific period annotate their texts .

Starting from the "Grand Tour", a kind of initiatory journey that during the eighteenth century port on the peninsula people like Goethe and Sir William Hamilton.

We present a guide written in French for the French, of 1909 that prepares to visit the city for the exhibitions of 1911, "Turin petit guide de la ville et des environs.

We can see pictures and a map of how the city was laid out, with the new architectural forms - cultural, streets, squares, churches and palaces, were analyzed as more elements are treated, what elements and monuments is channeled attention, such as judgments and criticisms are addressed to them. Was interesting to note that the direct routes and affect the interest of the city.

Important is the invitation to participate in the great exhibition in honor of 50 years of united Italian state," En 1911 la ville de Turin célèbrera dignement le cinquantième anniversaire de la proclamation de l'Unité d'Italie et de la proclamation de Rome capitale du nouveau royaume. Forte des précédentes, elle organise en 1911 une grande Exposition Internationale des industries et du travail, que sa Majesté le Roi Victor Emmanuel III a bien voulu honorer de son haut patronage. L'exposition se tiendra dans le parc splendide et pittoresque du Valentino".

Very clear is the description of the city and its king are honored to celebrate the event with an exhibition in 1911, which will take place in the beautiful and picturesque Valentino Park.

The guide is well described, railway stations, the tunnel for the purchase of tickets to visit the exhibition. The hotels where to stay, and museums and collections including The Royal Armoury in Piazza Castello, which is still present, the Royal Picture Gallery, in sciences Academy, now the Egyptian Museum, the Natural History Museum, now lying in seat.

The museum of geology and paleontology, in Palazzo Carignano time with free admission now non-existent, the national museum of Italian independence at the Mole Antonelliana, now in the Renaissance Palazzo Carignano, the collection of the Albertina, at the time, free picture gallery of hours' Accademia Albertina. The Artillery Museum of the citadel still present, the Museum of alpine views to the Mount of the Capuchins, now a museum of the mountain.

Description particularly pleasant in enhancing the city with many museums still outstanding and many no longer be considered a list of the main buildings still exist, while the churches lists a small number, the Cathedral of S. Giovanni with the Chapel of the Sindone, the S. Lorenzo, the Sanctuary of the Consolata, S. Filippo Via Maria Vittoria, and the S.S. Martyrs of Via Garibaldi. While monuments are all listed as the many parks and public gardens.

Even the public toilets and refreshment facilities, still present il Cambio in Piazza Carignano, confetteria Baratti in the gallery Subalpina, the Bicerin in Piazza Consolata, while the only hotel that still exists is the Grand Hotel Europe in front of the Porta Nuova train station.

Fascinating description of pharmacy care with the British list of the hospitals, and post offices. A special analysis should be paid to the city map attached to the guide, where they are immediately eye services the tram network, marked with a red line, the rail network marked with a black line in the description, outlining the origins of the railway line main, France, Milan, Venice, Genoa, and the

streetcar tracks in the city. Are well described and illustrated the major parks in the city, which is still in place, squares and main courses.

While a simultaneous analysis we can see the limits of the construction period and the nodes of containment river with links bridges and the railway.

In these pages, we can see how the image of a city is given by the beliefs, feelings, impressions, ideas that people perceive that place through the combination of different ingredients, including climate and offer natural, products and services, the presence of businesses and the economic development through the great exposure.

In addition, institutions and systems of government regulations, international relations, the role of commercial, financial and political, the level of training and education of the people, the importance of historical, artistic and cultural heritage, there are also the anthropological aspects and folklore to tradition, the historical and social reality.

All these factors contribute to the formation of an identity of the city as was seen at the time. Surely, space should not be seen in his objectivity, but rather in its narrative component is a place to go, to explore, to discover, like a dream in the past. We must consider, however, that the tourist guides, as texts are an obvious example of the influence that communication policy can have on the perception of tourists, in the creation of their own personal idea of the destination, in creating the sense of place. The space is designed to be seen, so for a look, for an observer, the 'identity of which we speak now, however intangible, symbolic, is aesthetic, but also the result of precise communication strategies and cultural memory of a particular historical period .

Building a new landscape. Land reclamations and new rural towns during the Fascist Regime along the coast south of Salerno

Antonella MARCIANO

Il Università di Napoli- Facoltà di Architettura Luigi Vanvitelli
a.marciano@unina.it

Abstract

The urban program developed by the Fascist Regime had a double direction, on one hand, regularize and make healthy the cities through disembowelments, straight streets and new settlements based on a cartesian logic, on the other hand the Regime aimed to subdue the wild nature, making the marshes fertile. With the "Ruralization Program", the Regime tried to persuade people to live in the countryside working the land, thus contributing to the construction of a well-defined social and economic model, in which the ideal fascist landscape perfectly reflected a determined idea of society. After the approval of the Law on National Program for Land Reclamation, in 1928, many areas were involved in the reclamation works. In the Gulf of Salerno, the reclamation of the marshes, which infested the Sele River coastal plain, was at the centre of a very intense work. Its aim was to tame the marshlands, turning the unfertile territory into a fertile landscape, dividing the land into plots and breaking the large estates. Within this new hospitable environment, new rural villages were founded, that in the intention of the Regime were to become the core attractors for a resettlement of the countryside, cornerstones for a new order and organization. This paper aims to analyze how the land reclamation program was connected to the process of constructing an ideal fascist landscape, what impact had this activity on the area, its results and finally the traces that can still be recognized.

Keywords: Land reclamations, rural towns, Fascism, Bay of Salerno

1. The Fascist ideology and the civilizing value assigned to reclamation works

During the Fascist Regime in Italy, particularly in the decade between 1932 and 1943, there was a period of considerable activity in the field of public works. With an action that has few precedents in Italian history, the Regime planned the radical renewal of urban centres, the creation of new neighborhoods and the establishment of new towns and villages. At the same time land drainage and reclamation works were carried out.

This activity will imply a total redesign of the landscape of many Italian regions, from north to south, deforestation, leveling, draining, geometrizations of roads and channels. These works continued until the 60s of the twentieth century remaining indelibly fixed in the memory of the places. Today it is possible to recognize this activity of redesigning in some places once characterized by wild and uncultivated land, flooded by secular marshes, then transformed by the furrows of channels, new cultivations and finally through the newly founded villages that had to constitute rural settlements designed to populate areas that were previously uninhabited [1].

This at least has happened in the Sele Plain, a wide area around the Sele river in the south of Salerno, an area identified in maps and historical chronicles as a place infested by swamps and marsh fever. The surrounding areas inhabitants went there typically in the winter months, then they abandoned it again in the summer months due to malaria, returning to their mountain villages not far away. In this paper we will see how this area appeared before reclamation activities and, through historical maps, we will estimate the entity of work carried out and the way the area appeared after the reclamation.

1.2 The ideological climate and the support of intellectuals

During the Fascist Regime the goal of increasing population of the peninsula and therefore the conquest of new territories was seen as one of the keys of the power and a reason of improvement of the offensive capacity of Italy. In the well-known speech of the Ascension in 1927, Mussolini enunciated the terms of its demographic concerns: «*Italy to count something must appear on the threshold of the second half of this century with a population of not less than 60 million inhabitants* », and more: «*I assert that even if it seems not so crucial, the demographic power is an assumption preliminary to political, economic and moral power of the nations*».

The policies to populate the countryside already formulated in the liberal Italy and later during the fascist Regime were intended to encourage a stable and enduring establishment of family groups of rural origins, generally from the north of the peninsula. The appointed places were some areas of central and south Italy and african colonies. At the turn of XX century some governments were driven by nationalistic and imperialistic reasons to create new settlements in Eritrea, Libya and Ethiopia. At the same time Italy was trying to reclaim some territories from the marshlands. It was considered a priority to make available, at home and on african soil, the greatest possible quantity of land that would later be colonized by a growing rural population. There were many draft bills aimed at favouring the peopling of rural uninhabited areas, or not very fertile, long abandoned, malarial. In the beginning there was Baccarini's law, launched in 1882, which regulated, with prevailing hygienic purposes, the land reclamation (mainly the wetlands of Po Valley), without dealing specifically with the problem of development and agrarian transformation of the areas to be reclaimed.

Between 1852 and 1947, there were more than twenty legislative measures, but only during the fascism this goal from a purely hygienic question turned into a demographic and urban goal[2].

Today we can state that the organization of rural areas was one of the most characteristic expressions of the fascist period. Various ideological suggestions fueled the politics of peopling: the ruralism, intended as an antidote to the ills of modern society (urban and industrial), the 'myth' of abundance and fertility of waste lands, the idea of creating migration outlets for a superabundant population and without sufficient means to live at home. Above all, the attempt to stop the emigration to foreign countries and the consequent depopulation of certain areas of the South of Italy. Obstacles to this program were the productive backwardness and the hydraulic instability characterizing vast agricultural areas of central and southern Italy, the high levels of poverty, the unemployment and the social unrest recorded in several areas of the north, that were at the same time overpopulated and with a declining birth rate [3].

The intellectual world accompanied the Regime giving it force with studies and data. Even the contemporary journalism aimed to highlight the issue of peopling. The debate revolved around the terms *population's excess - new lands - emigration*, a trinomial that formed the ideological core of rural colonization projects. The laws in matter of colonization chiefly concerned areas of central and southern Italy- Roman Agro, Sardinia, Basilicata - characterized by very precarious environmental conditions, extensive agriculture and lack of local farm workers. At the end of the twenties, the program for the reclamation and peopling was accompanied by the Law on ruralization.

1.3 Integral reclamation and Law on ruralization

The law of July 6, 1939 n. 1092 "Measures against urbanization" was used to detain people in small rural towns. For example, the law provided that it would be granted the residence in cities with more than 25,000 inhabitants only to those who had been able to demonstrate that they have sufficient means of subsistence or a stable job in the city in which they intended to transfer their residence. Moreover, this law, at article 7, stated that farm workers who abandoned their land without good reason, could not be registered "*to employment agencies for work of a different category, even within the town where they had the residence*". This was a way to tie firmly and permanently the peasants to their land, a reminiscence of some medieval laws [4].

It was created the legal basis and ideological support for the program of internal colonization. Finally, it was through the laws on land reclamation (1928 and 1933) and on large estates in Sicily (1940) that this program saw the light materially. The basic law was Serpieri's law, no. 3256 of 30 December 1923, in which were founded land reclamation consortia managed and financed by the State[5]. These were used to provide funding to a wide range of hydraulic and agricultural rehabilitation works, on a national scale, whose aim was the "*integral land reclamation*", called *integral* because it meant the total transformation from the physical, social and hygienic points of view, and finally the repopulation of the less fertile or long been abandoned lands. The construction of thousands of new farmhouses in scarcely populated areas at first responded to the needs of agricultural development, it was planned to introduce large-scale farming of intensive cultivation in place of extensive agriculture. But it was also useful for the purposes of social control: thousands of tenant farmers were uprooted from their social ties and isolated in their farms. Especially in the north of Italy, peasants were day laborers and tended to come together in organizations that sympathized with the anti-fascist parties. The program of internal colonization was accomplished through public agencies which had almost exclusively public

funds. One of these was the 'National Opera Fighters' (ONC), an agency founded during the First World War which was involved in the work of rehabilitation of war veterans, following the slogan "*land to the veterans*." Under the coordination of ONC, between 1932 and 1939 in the Roman and Pontine Marshes it was carried out the fractionation of cultivated or arable lands suitable for the *optimal cultivation*, for a total of 55,000 hectares of land and the construction of 5 new towns and 17 rural villages, the transfer of almost 3000 families mostly originating from the farms in Veneto and Emilia Romagna, and between these, families of Italian descent specially made returned from Romania, Yugoslavia, France. As for the South, other important works of colonization were carried out in Campania where it was started the reclamation of the Lower Volturno, Right Sele, and in Calabria, Sybaris and St. Euphemia [6].

Some initiatives were promoted by private companies who realized industrial villages who shared morphology and urban spirit of rural villages. Among them, we must remember the Arsa, *Anonima Società Carbonifera* (which financed the construction of Arsia together with the *Azienda Carboni Italiani*), the Ampelea (*Luigi Razza* village near Lagosta), the *Società Agricola Industriale Cellulosa Italiana* (Torviscosa and village Rome), the *Società Maccaresse* (village of the same name), the SAIM who built the villages *Farinia* and *Cafasso*, the *Società Anonima Bonifiche Calabresi* (Sant' Eufemia, Lamezia, Sant' Eufemia del Golfo, San Pietro a Maida, Curinga), the *Società Anonima Bonifiche del Mezzogiorno* (Frassa, Thurio, Torre Cerchiara), the *Società Bonifiche Sarde* (Mussolinia).

The entry of Italy into the war, the political and military events of the early '40s, the many inadequacies in technical terms determined by excessive urgency with which the reform had been prepared, blocked the planned programs. Much of the works, the construction of more than 2000 farmhouses and dozens of rural villages, were carried out during the first year of implementation of the law. Many villages did not see any development, or were again abandoned at the end of the war. Instead, the big reclamation continued until the sixties of the twentieth century. Until 1943, the time of the landing of the allies, however, it resulted that dozens of villages, thousands of new houses and many kilometers of drainage roads and aqueducts were built.

2. Villages of new foundation _ common characteristics

Part of the reclamation, colonization and ruralization programs, was the foundation of new towns, especially rural villages. Beside them, some settlements were founded in the course of the '30s, whose purposes were not subordinate to the ruralist experiment, but rather to the needs dictated from autarky, the much sought after economic self-sufficiency. Until the recent past, it was believed that the newly founded cities, more structured in terms of planning and of which there is an extensive coeval bibliography, were only twelve. Depending on the well-established historiographical tradition, seven were "*city of reclamation*" (Mussolinia, Fertilia, Latina, Terracina, Pontinia, Pomezia, Aprilia), cities created to populate previously swampy areas, five "*autarchic cities*" (Arsia, Pozzo Littorio, Torviscosa, Carbonia, Guidonia) connected to a particular industrial centre. Actually, the newly founded villages are far more numerous and scattered throughout Italy, especially in poorly known territories[7].

To the names already mentioned should be added the villages of new foundation in areas until now almost completely unexplored from this point of view, such as the rural villages around Rome and Foggia and most importantly, that is the object of this study, the villages in the south of Salerno, in the Sele Plain, where we find both the autarchic villages as *Farinia*, *Cafasso*, *Scanno*, both the rural villages as *Corvinia*, *Valentinia*, *Cioffi*. The characteristics that link together these villages and the newly founded cities, are the emphasis put on the demographic revival of a place uninhabited for years, the strict spatial organization of the territory, the creation of the new settlements based on a specific social and economic project. The rural villages were founded at the crossroads of major farm roads or at the main lines of communication, and intended to provide essential services to the population of farmhouses established in the countryside.

In the bigger centres were: the church, a school, the National Fascist Party seat, other organizations and trade unions, a post office and telegraph, a police station, the colonization office, small groceries and resale for different genres, workshops. The planning was based on a rational scheme. The whole took place around a small central square where there were the church, the house of the beam, the direction of the farm and a few houses for artisans and traders. The square had a regular geometric shape from which were radiated rectilinear roads. The houses were built on two levels and conformed to the main features of rationalist architecture: complete absence of ornament; simple geometric forms, flat roofs [8].

In the Sele Plain, some new buildings were associated with agricultural production. The traditional breeding of the buffalo was associated with cultures as tomato and tobacco. The new tobacco factories, and other agricultural activities attracted workers from neighboring countries. The tobacco was at that time one of the most profitable activities. Indeed, the first urban initiatives were carried on by SAIS (*Società Agricola Industriale Salernitana*), founded in 1918, initially engaged in a general processing of agricultural products, and then attracted by the tobacco industry. In 1933, the SAIS merged with the *Società Anonima Stabilimenti Riuniti Tabacchi Americani* giving life to the SAIM

(*Società Agricola Industriale Meridionale*), who built ten plants for the processing of tobacco's leaves including the drying and handling of leaves. In some relevant episodes, SAIM gave birth to newly founded villages connected to tobacco factories. Some model farms were founded by the SAIM, including one of the most renowned in the area of Scanno, where worked 800 people. The same was done in the estate of Gromola, to the south of the mouth of the Sele, where were erected buildings for executives, for permanent workers and sharecroppers. We can also remember the changes that occurred in the Verdesca and Picciola farm, where was located a SAIM factory; the Cioffi farm, the farm of the Rosale, Società Agricola Immobiliare[9].

Fig. 1: Panoramic views of the village Valentinia, 1940

In the fascist vision, reclamation was completed with the establishment of new villages, new constructions able to cement and strengthen the relationship between man and earth. In 1923 the National Opera Fighters (ONC) bought the estates Cioffi, Scorziello and Macchione, all in the territory of Eboli and in the province of Salerno, in a scarcely populated plain area. These last two properties were soon divided into lots, and subsequently assigned to ex-combatants farmers, who have been obliged to improve and cultivate their lands. In this way, 128 farmers were given small lots of land oscillating from one to three acres, that is for example the case of the estate called the "Macchione", with vineyards and orchards. The estate Scorziello was expropriated to the Duchess Amalia Scorziello Colonna in Torlonia by order of ONC in February 1923 and measured 313 hectares. The estate Cioffi, expropriated to the Duchess Amalia Scorziello too, measured 480 hectares, had special conditions that induced ONC to a different intervention. The estate was in fact in the plain, towards the sea, 15 km far from Eboli, 13 from Battipaglia and 5 km from the nearest train station, in highly malarious area which needed a very expensive land reclamation, beyond the economic capacity of individuals owners. In the estate, divided into nine estates of 50 hectares, it was practiced the wild breeding especially of buffaloes. One of the most important villages was Farinia, connected to the tobacco factory SAIM in Pontecagnano, which had the clear mark of rationalism, showing a still legible fascist organization of small production units[10].

Fig. 2 S.A.I.M. Farinia. A view with the manufacturing plant on the left and the small town with a church on the right. Photo Attilio Majorana, 1938

The tobacco factory was founded by the SAIM held by Carmine De Martino between 1935-1936, in the area of *Picciola* in Pontecagnano, a town in the south of Salerno, a short distance from the sea. That territory was already made productive, thanks to the efforts of the last owners, the family Lenza. Later on, the intervention of De Martino radically changed the facet of the estate *Picciola*, with the demolition of an old medieval tower, a church and a few buildings still existing on the site.

In their place, was built the largest factory that still can be seen and the rationalist village "*Farinia*", named after Fortunato Farina, well-deserving for the agriculture in Salerno. The inspiration and the architectural language of the manufacturing complex and the rural village were in harmony with the architectural vocabulary of the newly founded cities of the Agro pontine. And so it was defined in the contemporary chronicle: "*Farinia is the farming model village according to the great concept of Mussolini, with all the comforts and possibilities*".

Even today, the strong horizontality of the main building of the tobacco factory, is a counterpoint to the high tower adorned with lictors fasces and two clocks to the sides, that give the complex a monumental mark and an austere impact. The village, built between 1937 and 1938, can be regarded late compared to others, considering that Pontinia was founded between 1934 and 1935, Littoria in 1932, Sabaudia between 1933 and '34. The village was based on a rigid cartesian pattern in both design and functions. A central square surrounded by a few houses, and dominated by a brickwork church, with a single nave and a facade characterized by a high porch. The buildings around the square are of modest size, two-story, in which were placed a kindergarten, some stores and the direction of the agricultural department. Only a small part of the buildings housed workers engaged in the adjacent tobacco factory, giving the village a strong symbolic value as an aggregation and rural organization centre, rather than the meaning of a primitive cell of a possible urban development, tied to an impossible peopling, since the workers of the nearby tobacco factory, continued to come from neighboring countries. And because it is confined in its original size, almost nailed at the time of its founding, the town is still so recognizable, as it was originally isolated from the urban context and immersed in the countryside, an outpost of the process of re-appropriation of the land, once swampy.

Instead, the village of Cafasso, at Paestum, linked to the SAIM tobacco factory, called "*Razza*", had known a larger development [11]. The complex of the tobacco factory was inaugurated on September 12, 1936, "*with an austere fascist rite*" and dedicated "*to the immortal and glorious name of Fascist Minister Luigi Razza*", who died "*in the ardent eve of the glorious exploits of the Fascist Italy*". The company SAIM could then boast of having already "*redeemed thousands of hectares of swamps and malarial lands, by implementing with great success the Mussolini's law for the reclamation of the land,*" and besides built "*ten tobacco factories*", able to employ almost "*3,000 workers*"[12].

The tobacco factory "*Razza*" stood in a marshy area afflicted by malaria, that SAIM wanted to "*reclaim, making an highly humanitarian and fascist work*". The factory was built near the railway Battipaglia - Agropoli in the municipality of Capaccio, and included some residences intended for managers, offices, stores, and especially the large building for drying tobacco with reinforced concrete framed structure, closed by a solid brickwork, designed by the architect Luigi Guercio[13].

Among the newly founded villages we remember Matinella (in the town of Albanella) with post offices, shops and primary school; Baraccamenti, a temporary site for Serre's farmers. An agricultural colony in San Berniero in Eboli was designed, the village "*Corvinia*", consisting of 80 farmhouses, was founded on estates "*Difesa Nuova*", between Montecorvino Rovella and Pontecagnano. Corvinia, both rural village both village for airport employees, was reported on the military maps under the name of "*airport Montecorvino*". These initiatives, implemented by private capital, had to be the germinal seed for the reorganization of a territory dominated by spontaneity of scattered houses. The small village had in common with the village "*Farinia*" the strong horizontality of the architecture, the typology of services, and the centrality of the small church, the shapes solved in deliberately classic way. The main street is wide enough to be a real square, a space that links together the small houses arranged around it, but that - as in "*Farinia*" - has turned to a centre, a measure and a order for the rural surrounding landscape. Valentina, not far to Corvinia, was a farm which still exists today with its silos and its farmhouses, but it never became more than a very little group of buildings. Only Corvinia had a subsequent development and today is a small district of Pontecagnano.

In this territory the city of Battipaglia was becoming increasingly important, and even if it can not be considered an actual new city, it was reborn as an autonomous administration in march 1929. From an urban design point of view it was inspired by the newly founded cities, the '*new towns*' of "*redeemed agro*" (Littoria, Sabaudia and Pontinia). The "*new city*" with its new quarters, born under the ruralist politic of Mussolini, was built in a very short time and through the massive transfer of people from other regions. For these reasons, Battipaglia in the '30s represented a typical phenomenon of urbanization in the contemporary age. What in the origin was a village became a city mainly because of its geographic position and the fertility of the land.

3. Transformation of wild nature into productive nature

The landscape offered by this alluvial plain has changed significantly over time. For hundreds years the Sele Plain was considered an unhealthy and wild place [14]. Several antique maps depict wetlands or coastal lakes. To these cartographic evidence we can add the chronicles of the time travelers [15].

The abbot Domenico Romanelli, in his *Antica topografia istorica del Regno di Napoli*, thus describes the Plain: "After crossing the river Sele, other six miles from here there appeared a large plain, where the famous city of Paestum was located. But what a show! ... an horrible stagnant marsh, a pile of mud, streams and water sources putrid and muddy, brambles and bushes, and piles of debris and stones cover today that blessed land where there was Posidonia".

The cause of the stagnation of water was due the scarce drainage conditions related to the presence of the coastal dunes on one side, and in the inland, the depressed areas. In the plan of Domenico De Rossi (1714, *Provincia / del Principato Citra / già delineata dal Magini / e nuovamente ampliata secondo lo stato presente / Data in Luce da Domenico de Rossi, / e Dedicata / All'Ill.mo Sig.re / Il Sig.r Auocato Diego de Pace*), there is a large wooded area to the right of the Sele, dominated by a big lake "Lago Grande".

Fig.3: Excerpt from the map "Province of Principato Citra already outlined by Magini and again extended in accordance with the present state", 1714, Domenico de Rossi

Afterwards the landscape has seen the beginning of the human intervention, trough which were made limited reclamation activities, actually from Roman times until the '60s, with a peak of works performed during the Fascist period. In 1829, Carlo Carlo Afan de Rivera, engineering director of the Corps of Bridges and Roads, Water, Forestry and Hunting of the Kingdom of the Two Sicilies, ordered the reclamation of Sele by filling the depressed areas with the Sele's muds and by creating a system of canals to be used to irrigate the areas further away.

This project, soon abandoned, was resumed in 1855 according to Borboni's law which entrusted to the *Amministrazione Generale delle Bonifiche* the projects and enforcements of the reclamations. The *Amministrazione* started up with the reclaim of territory at the left of the Sele through new channels and by filling the depressed area at the right of the river. So, the main work carried out up to 1914 had been the filling of the depressed area called the "*Pantano della fonte*" through the muds of the river Tusciano, the construction of tanks, the opening of several channels. The First World War intervened to stop all these new works [16].

Fig.4: Jacob Philip Hackert (1737-1807), *Royal hunting lodge of Persano*, in Caserta, Royal palace

The IGM sheet no. 73 dated 1871 clearly summarizes the topography of the hinterland in the right bank of the Sele. Along the coast is the wooded area of Campolungo and at the left of the Sele that of Vignardo. Behind this strip characterized by green, we find the depressed areas of the marshes, the lakes formed by the continuing stagnation of the water. Unhealthy zones just interrupted by a few canals. In the island of land between the rivers Calore and Sele there is the Royal Casino of Persano, a pearl isolated in this inhospitable place, and the woods of Persano [17]. Finally, to the north, the towns of Eboli and Battipaglia shown before the urban development of the twentieth-century. In this map, the wild nature still shows the total control of the territory, the man lived in inland areas, confined in small estates or in the hill towns.

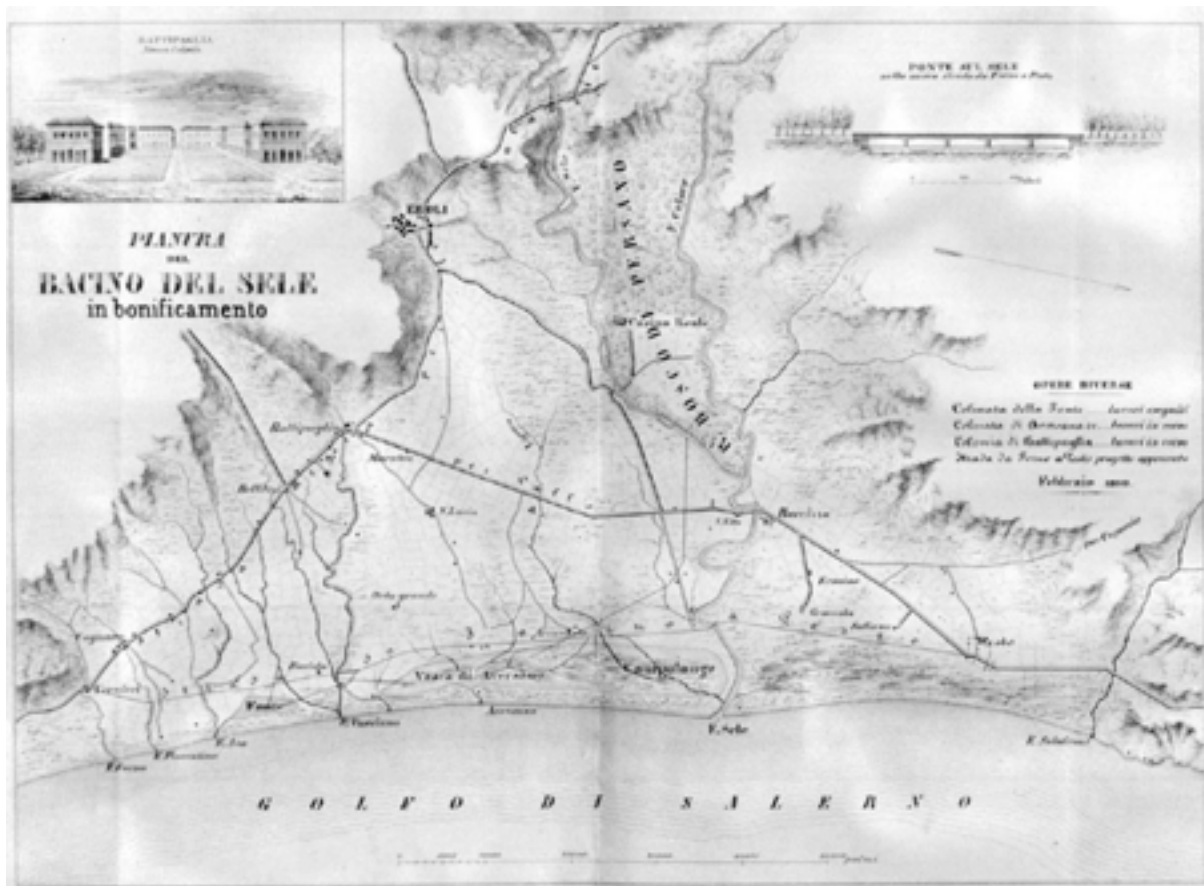

Fig.6 "Pianta del bacino di bonifica del Sele 1860", Arch. Centr. di Stato di Roma, Bonifiche I ser., b. 23, F/16

In 1923, the company composed of Mattia Farina, a lawyer, and the engineer Antonio Valsecchi asked in concession the completion of the reclamation works on the basis of the project of Angiolo Omodeo and obtained the permission of deriving water for irrigation. At that time it was clear that by directing their efforts towards the natural drainage by filling the depressed areas could only bring slow and insufficient results. Then the Company Farina - Valsecchi was replaced by Società Anonima Bonifiche, the SAB, which since 1928 arranged a project of reclamation [18]. It was conceived a project for arranging new embankments of the Sele and Tusciano and the construction of the dam alongside the river Sele (1929-1934) at the level of Persano. The dam is 180 metres long and 9 metres high, is just upstream from the Roman bridge, and creates a restraining basin that feeds channels conveyance of water from the river to the fields. From the main channel, marked by bridges and tunnels, it branched the network of distribution channels that supplies water without using lifting plants [19].

Fig. 7:The Persano dam (Consorzio Bonifica destra Sele) **Fig. 8:** Drainage channel, Eboli, author's photo

The Company also began the construction of buildings for groups of 12 families for "rational" breeding of buffaloes and horses, and 56 farms where to house 800 people. The address was to shape a sedentary agriculture, with the farmers who permanently reside on the place. It was planned to build farm roads, new power lines, pipes of drinking water and irrigation channels [20]. If reform efforts of the Regime, although imposed with a marked authoritarianism will clash elsewhere with the

landowners and the lack of cooperation between them, resulting ultimately a fragmented and ineffective action, in Battipaglia and Pontecagnano the land was slowly fractionated with the rise of the irrigue crops. It was implemented concretely and more effectively than in other areas, the "electro-irrigue" plan suggested by Arrigo Serpieri, then undersecretary of the Ministry of Agriculture, despite the limitations caused by the perhaps excessive extension of the areas object of the remediation program. At the same period, there is an important economic growth associated with the activities of agricultural products processing. It is here that the history of reclamation intersects with the growing spreading of the tobacco plantations, already traditionally cultivated in Salerno and object of attention around the thirties of the twentieth century. In close proximity to tobacco processing plants, rural villages arose together with the factories, becoming an element of both economic and social revolution. In this idea was condensed the fascist agrarian policy, whose key points and presuppositions were - in practice - the reclamations, the defense of the rural life and the cult of the family, understood as a demonstration of moral and physical vitality of the Italian people. Other important achievements were the installation of three idrovore plants at Asa, at Aversana and at Sele's estuary, but it is only in the 'post-war period that the reclamation of the whole plain could be considered an accomplished fact, thanks to the construction of country roads. Several road sections were made, straight roads with trend north - east and south - west parallel to the irrigation canals, which branch off from the main road linking Salerno to Battipaglia.

3.1 The new Landscape

This intense reclamation work mainly carried in the 30s of the twentieth century has left an indelible mark, significantly changing the perception of the landscape: here we have the best results of the reclamation between the two world wars, as it did for Emilia and Agro pontine [21]. After a stop at the turn of the second world war, even the postwar left a deep mark in this area. Some IGM plans detect precisely the transformations that took place in this period. In the fifties and sixties of the twentieth century the land reform causes the breakdown of large estates, and moreover, by building a network of irrigation canals and rural roads, by using DDT, the powerful insecticide introduced by the Americans and finally, by implementing new techniques for processing and marketing of agricultural products it was obtained a radical evolution in agriculture and a total change of Sele Plain's physiognomy [22]. The farming mainly based on subsistence and on landowners has been transformed into a modern and sophisticated system of agricultural production. Malaria was eradicated. Less success has been achieved in founding rural villages designed for the settlement of farmers in the reclaimed areas, as people preferred to move to more structured urban centres as Battipaglia, Eboli and Pontecagnano.

Fig. 9 Istituto geografico Militare, Sheet no. 198, Paestum. The grid formed by the drainage channels and plots of land facing towards the sea, appears prominently

Fig. 10 Istituto geografico Militare, Sheet no. 198, Persano. Legend: "1" SAIM Plant for the processing of tobacco, Fioche, Eboli, "2" SAIM plant, Scanno; "3" Royal hunting lodge of Persano. The two SAIM plants were connected with each other and with the casino Royal

Despite this, the small rural settlements were an important and tangible step towards an overall land redesign. In the described context, the rural villages of Piana del Sele - "Farinia," "Cafasso", "Corvinia" and "Valentinia" too - are evidence of an housing system of new conception, the result of a complex ideology that has become a structural framework for the social, economic and urbanistic history of the Plain. Visible signs in which is still recognizable the rationalist architecture, dotting the plain with its characteristic volumes, square and simple. The tangible evidence of human presence that has reclaimed the land, which is now marked by canals and straight roads, farms with modern silos, channels carrying stagnant waters into the sea. The system of canals of anthropogenic origin with its network has fixed the characteristics of the roads' planning and the drawing of the agricultural plots. The victory of man over nature is the true deep meaning that this landscape embodies, the modernity that defeats the wilderness giving it a purely fascist shape. A land bent to the needs of the man, who has been able to give a cartesian order to an incoherent and wild landscape, transforming it into a plain intensively cultivated with small but evocative built up areas of fascist origin.

SENSORY EXPERIENCE IN ARCHITECTURAL MEMORY: TRANSFORMATION OF INDUSTRIAL BUILDINGS

Mads Harder DANIELSEN

Faculty of Engineering and Science, Aalborg University, Denmark
mads@foodplusdesign.dk

Abstract

By focusing on the connection between memory and sensory experience within the themes of conservation, regeneration and innovation this paper addresses the transformation of industrial buildings for future development.

How can the tangible and intangible cultural heritage be articulated and contribute in this transformation?

The current cultural centre *Nordkraft* - a former power plant and an icon of the industry in the northern part of Denmark - is utilised to investigate the role of heritage in architectural regeneration with focus on authenticity and local identity.

Memory is described by Marcel Proust in his novel *In search of Lost Time*: Here the phenomenon of involuntary memory is described as the essence of the past, which cannot be contained in the conscious recall of memories. Proust enhances that the mental images of the involuntary memory are brought out by gestures of the physical realm – sensory experiences.

Sensory awareness resonates within a phenomenological tradition in areas of architectural theory:

The Scandinavian theoretician Juhani Pallasmaa draws on the philosophy of the bodily by Maurice Merleau-Ponty as he inscribes memory in the experience of architecture. Pallasmaa connects memory to imagination and perception which he argues play significant roles in the way a place is experienced. With this kept in mind: How can historical memory and characteristics of identity contribute in a contemporary activation of the potential of unique buildings of the past?

Keywords: Sensory experience, memory, industrial buildings, Pallasmaa, Proust

One of the most urgent issues for the present western societies is the intermediate stage between economies based on industry and economies based on leisure. The technical developments connected to this transition have at once changed the reality of local identities to a global matter leaving some of the most physical statements of local technology behind in limbo: Areas of the industry in cities are becoming superfluous and posing challenges for an industrial architecture, where functions to an extreme extent dictate the form – no redundancy, no compromise. The history of the industry has left behind a heritage of a distinctive architecture which contains use of material, scale and structural transparency unparallel to conventional building culture found in the living quarters of the city. The transition to leisure economy during the anterior decades has left numerous of these industrial areas and buildings with great potentials desolated in cities: As these areas of yesteryear have become encased in the dwellings of the city questions arise to the destiny of the industrial architecture in a further development of the city: Can conservation of the heritage of industrial architecture be implemented in a transformation not only focusing on progress, but also securing authenticity and local identity by the means of architectural regeneration?

Next to the streams of Limfjorden is just one of these industrial areas. For more than a lifetime a stretch of the southern bank of the fjord was dominated by the industry of Aalborg, the largest city of the northern part of Denmark: East of the city centre the smoke from chimneys of the factories would steadfastly rise throughout the hours, days and years of the twentieth century. During the passing time

the industry of Aalborg did not only shape the physical identity of the city – the industrial environment also made another impact on Aalborg. The architect Thomas Birket-Smith has expressed the influence of the massive areas of industrial production and concrete buildings:

When I recall my childhood in the Aalborg of the 1960s, the grey powdered neighbourhoods close to the cement factories stand vividly in recollection. The lampposts close to Aalborg Portland [factory red.] are still to this day covered by a layer of harden cement which has settled during the time of decades. In a similar way the consciousness of the home town's past as an industrial centre has settled in the minds of the residents of Aalborg and is therefore a significant part in the understanding of the identity of this city [1].

A half century later from the childhood memories Birket-Smith became a part of the conversion of the industrial areas of Aalborg where the flagship of the process became the former power plant Nordkraft. The building complex of the inactive power plant was transformed from a regional centre of energy production to a cultural centre providing Aalborg with a total of 30.500 square metres of cultural activities [2].

Nordkraft is on the eastern harbour front of Aalborg placed in the epicenter of the transformation that is currently unfolding in Aalborg: The regular, rhythmic sounds of the pile driving from the neighbour sites resonate as an ubiquitous admonition of the growing cityscape just here: This is where the industrial grounds are currently moving towards new use; and right in the middle of this process Nordkraft stands with its thirteen floors of concrete, steel and bricks.

The road that led to the transformation began in the 1990's when a political decision was made to expand a newer power plant built in the sixties (Vendsysselværket) in the northern part of Denmark. This was the beginning of the end for Nordkraft as a power plant; and the power production stopped in 2002 – the same year as the publication of the Danish author Jakob Ejersbo's breakthrough novel where the narrative is placed in Aalborg.

In his novel Ejersbo gathered a tripartite story of human propulsion and hope of change in the underground of Aalborg under a common title; and he chose a simple name for the book: *Nordkraft*. The power plant did not play any part in the novel and was barely mentioned - however the name of Nordkraft still encases the narrative of power, progress and promise...

The name Nordkraft can be translated to *power of the north*. This ambiguous name resonates with the roles of Nordkraft: The former use as power plant and the present use as cultural centre – a motive force of power and cultural life in the region. This however raises questions regarding authenticity, heritage and identity in the process of the transformation from energy centre to cultural centre.

Can the story of a city with two distinct shades of identity be contained within a single transformation? Significant changes has surely undergone the site of Nordkraft since the first power station was built at the banks of Limfjorden in 1895; Nordkraft has left the function as a power plant behind, but as Ejersbo's title indicates: The building of Nordkraft has not diminished as a symbol of the identity of Aalborg in the minds and memory of the inhabitant of the city. This memory serves as the point of departure in the investigation on how the tangible and intangible cultural heritage of Nordkraft are articulated and contributing in an act of regeneration [3].

Marcel Proust has exhaustively addressed the entangled relationship between memory and the existential experience of the world in his novel *In search of Lost Time*. Here the quest for absorption and appreciation of the past is sought through the impressions of the present. The translation of the French autobiographical novel was first published under the name *Remembrance of Things Past*; and the themes of remembrance and recollection is just the centre of rotation in Proust's narrative of the extensive tracks of memory followed and crossed in the process of remembering.

A recurrent shade of remembrance and recollection embraced and enhanced by Proust is the involuntary memory. This memory is introduced through the encounter with a piece of Madeleine cake: On a cold winter day the protagonist of the story is offered hot tea by his mother to regain warmth; out of habit he first refuses, but an unusual experience occur as he accepts the tea served with a side of a small Madeleine cake: The flavour takes him far away from the coldness of winter and back to the summer Sunday mornings of Combray in childhood as he takes a spoonful of tea with a soaked morsel of cake to his lips:

As soon as I recognised the taste of the piece of madeleine soaked in her decoction of lime-blossom which my aunt used to give me . . . immediately the old grey house upon the street, where her room was, rose up like a stage set to attach itself to the little pavilion opening to the garden which had been built out behind it for my parents . . . and with the house the town, from morning to night and in all weathers, the Square where I used to run errands, the country roads we took when it was fine ... in that moment all the flowers in our garden and in M. Swann's park, and the water-lilies on the Vivonne and the good folk of the village and their little dwellings and the parish church and the whole of

Combray and its surroundings, taking shape and solidity, sprang into being, town and gardens alike, from my cup of tea [4].

The mere sight of the cake which the protagonist has encountered several times has done nothing like this, but a journey is triggered as taste buds encounter the same sensation of tea and cake that his aunt would serve before mass on Sundays: The town and gardens of Combray bloom from the cup of tea in a recollection of the past different from any voluntary recollection of childhood Combray. The Madeleine cake is one of the everyday encounters of the story that evokes a recollection lively in a manner different from any conscious attempt to recall the past – and these encounters become vital for Proust in the identity of the past:

The truth that intelligence grasps directly in the open light of day have something less profound, less necessary about them than those that life has communicated to us in spite of ourselves in an impression, a material impression because it has reached us through our senses, but whose spirit we can extract....I would have to try to interpret the sensations as the signs of so many laws and ideas, by attempting to think, that is, to bring out the darkness what I had felt, and convert it into a spiritual equivalent....Whether this was a matter of reminiscence of the kind that included the noise of the fork or the taste of the Madeleine, or of those truths written with the help of figures whose meaning I was trying to discover in my mind, where, like steeples or weeds, they composed a complicated and elaborate herbal, their first character was that I was not free to choose them, that they were given to me as they were. And I felt that this must be the mark of their authenticity [5].

The authentic character Proust assigns to the reminiscence of the involuntary memory is connected to the unprejudiced identity as the reminiscence is not able to be chosen – it is given. It is an occurrence that takes place outside the consciousness – or at least outside a Cartesian conception of consciousness. Could this reminiscence sparked by a sensory experience of the present realm be applied in the articulation of the authenticity intrinsic in the architectural heritage of the past? A memory of authentic character rising from sensory experience suggests a turn of focus towards the sensory of the bodily: In the search for an approach to the conservation of authenticity within architectural heritage focus could be turned towards sensory perception and experience. The French philosopher Maurice Merleau-Ponty has in his phenomenological thoughts addressed the relationship between body and world - and the connections of these to memory:

Existence always carry forward its past, whether it be by accepting or disclaiming it. We are, as Proust declared, perched on a pyramid of past life, and if we do not see this, it is because we are obsessed by objective thoughts. We believe that our past, for ourselves, is reducible to the express of memories which we are able to contemplate. We sever our existence from the past itself, and allow it to pick up only those threads of the past which are present. But how are these threads to be recognized as threads of the past unless we enjoy in some way a direct opening upon the past? [6]

This direct opening is in Merleau-Ponty's view closely linked to the encounter between body and world. Based on the work of Edmund Husserl Merleau-Ponty characterises phenomenology as a matter of describing and not explaining, analysing, constructing or forming. The encounter with the world is a direct experience - or to use the term of Husserl: A return to things in themselves. This means a return to the world which precedes knowledge – and Merleau-Ponty argues this happens through perception. The idea of the body as a mere tool or object for knowledge is abandoned in favour of the contrary view – it is through the body as a whole that knowledge, consciousness and existence are grounded [7]:

Truth does not 'inhabit' only 'the inner man', or more accurately, there is no inner man, man is in the world, and only in the world does he know himself [8].

The emphasis of the bodily intrinsic in the phenomenological approach of Merleau-Ponty resonates within areas of architectural theory: The Scandinavian theoretician Juhani Pallasmaa draws on the philosophy of the bodily as he inscribes the body at the centre of the experience of architecture:

Merleau-Ponty extends the idea of the processes of embodied thinking to include the entire body as he argues: 'The painter "takes his body with him" (says Paul Veléry). Indeed we cannot imagine how a mind could paint.' It is surely equally unthinkable that a mind could conceive architecture because of the irreplaceable role of the body in the very constitution of architecture. Buildings are not abstract, meaningless constructions, or aesthetic compositions, they are extensions and shelters of our bodies, memories, identities and minds. Consequently, architecture arises from existentially true

confrontations, experiences, recollections and aspirations [9].

In continuation of Merleau-Ponty's line of thought Pallasmaa argues that the existential nature of architecture makes it a multi-sensory experience; qualities of space are measured by eye, ear, nose, skin, tongue, skeleton and muscle in an equally and combined manner. As a result of this entangled character architecture can never be described as a mere visual phenomenon in an ocular realm. It is rather the strengthening of one's sense of being in a world where several realms of sensory experience interact with each other and fuse into each other [10].

Nevertheless, according to Pallasmaa a contrary tendency in the architecture of today is dominant: Modern consciousness and sensory reality has moved towards a biased sensory approach - hegemony of vision! Architecture has as a consequence of this become an art form of instant visual images without sensory invitations and discovery - without mystery and shadows. And thereby lost the existential foothold [11]. Pallasmaa states:

As buildings lose their plasticity, and their connection with the language and wisdom of the body, they become isolated in the cool and distant realm of vision. With the loss of tactility, measures and details crafted for the human body – and particularly for the hand – architectural structures become repulsively flat, sharp-edged, immaterial and unreal [12].

To secure the ability for architecture to embody confrontations, experiences, recollections and aspirations Pallasmaa proposes an emphasis of the visual on equal terms with the other senses; making architecture a multi-sensory experience where memory plays an important role. He states that all senses are interconnected - even the now dominant sense of sight collaborates with the other senses and this coherent sensory apparatus is according to Pallasmaa linked to memory:

Even visual perceptions are united and integrated into the haptic continuity of the self; my body remembers who I am and where I am placed in the world. In the opening chapter of Combray, Marcel Proust describes how the protagonist wakes up in his bed and gradually reconstructs his world on the basis of 'the memory of the sides, knees and shoulders' [13].

The conception of involuntary memory can be considered as a multisensory phenomenon in a continuation of the emphasis of the wholeness of the bodily by Merleau-Ponty and Pallasmaa. This however raises questions to the implementation in the transformation of industrial architectural: Is the approach to regeneration of architectural heritage hidden in an embracement of the full sensory palette? Can the memory of the body – of sides, knees and shoulders – facilitate an immeasurable and incomparable reminiscence of past and identity?

The first nineteenth century power station of Aalborg was succeeded in 1909 by a new station built on the site of Nordkraft in red bricks with a double-pitched roof. This building would be preserved in the 1940's as expansion of the power plant began; and a century from its erection the brick house came to play a key role in the transformation of Nordkraft completed in 2010: When the transformation was completed the double-pitched roof would shelter one of the most characteristic spaces of the entire building complex - the Kettle Hall.

The transformation of Nordkraft was primarily concerned with two approaches: The utilisation of the excess load capacity in the concrete and steel structure, and the balance between preserving as much as possible with the requirements for extra square metres in the addition of new decks [14].

The latter balancing resulted in a clear differentiation in the transformation of the power plant's spaces – this is especially seen in the two largest spatialities of the building complex: The Boiler Hall and the Kettle Hall. In the former regards to the extra square metres resulted in the implementation of a hanging black box of three stories. This 650-ton architectural addition utilises the existing load capacity of the structure while serving as acoustic regulator in the space now housing sport facilities. The badminton fields, fitness facilities and climbing wall of the hall are all profiting from the acoustic conditions and the daylight entering through the windows of the façades kept free of contact with the black box by the suspension from the roof structure [15].

Fig. 1: The Kettle Hall of Nordkraft (picture by Patrick Ronge Winther)

The opposite approach was applied in the Kettle Hall where the consideration to the preservation of the existing is dominant: The room is named after the massive kettles that once were used in the power plant. The coal powered kettles are long gone and the enormous volume today houses temporary functions such as markets, concerts, displays – and most important: It serves as the entrance to Nordkraft. The Kettle Hall is the link between city and building - the first encounter with the past. This is where the city steps inside and faces the grandeur of the industrial architecture. The kettles may be gone, but the transformation has preserved plenty of traces of the past as the room was left in the raw nature of its origin and no additional decks were added.

The scale of the hall is only met by the same extreme sense of materiality: An unveiled coarseness of concrete is dominant, the textures of the raw surfaces are let exposes in the direct light entering from the west facing façade composed by windows from floor to ceiling. Every tactile sense of materiality is amplified in the light of the Nordic sun; the light washing over the floor during the hours of day warms the surfaces and releases an immanent, faint scent of stone and dust...

Traces of the past use of the room are evident vast above the perpetual, ongoing interplay between the direct light and the deep shadows on the concrete floor: The massive coal funnels used to power the kettles still hang in a manner of stalactites. Before the encounter with the funnels the temperature of the unheated room has already served as a subdued sense of the spaciousness in the industrial architecture of the Kettle Hall. This sense is amplified as the ubiquitous connection to the past is sensed in a very direct manner under the hanging concrete coal funnels.

The weight of the massive construction almost yields a warning and adds a sense of vulnerability to the sensation of standing under the hanging, inclined sides of the funnels. The awareness of the human body's size is suddenly insidious surfacing...

This sensation of inferiority is only confirmed as the sounds of the Kettle Hall animates the entire room in the resonating and reflecting sounds on the hard concrete surfaces; the reverberation enhancing the sense of the voluminous spatiality.

Fig. 2: The coal funnels of the Kettle Hall (picture by Patrick Ronge Winther)

The transformation inevitable embodies the direct testimonies of the industrial architecture of Nordkraft by the conservation of the power plant's spatialities. This preservation of the physical and tangible heritage of Nordkraft is the fundamental capacity of the regeneration. But as an alone-standing gesture this approach contains the dormant peril of becoming an unilateral narrative as it is a one-sided story unfolded – the history of a single building.

However the emphasis of sensory experience in the transformation refuses this character to predominate as the links of the involuntary memory occur: The intangible connections to the past are made possible by the reminiscence – and thereby it is also possible for an indirect testimony to permeate the narrative of Nordkraft.

Through the reminiscence of the involuntary memory the present Nordkraft encompass not only the physical tangible heritage in the regeneration, but also the intangible traces and gestures to the past of Nordkraft. These tactile encounters linger in the spatial narrative, waiting in silence to open up the journeys of the reminiscence.

In the search of an approach to secure the heritage of industrial architecture it seems necessary to bring into focus the interventions applied in unfolding of the narrative in Nordkraft: If the involuntary memory is based upon the link of two sensory experiences - how is the reminiscences sparked by the gestures of the Kettle Hall linked to sensory experiences in the past?

This question is essential in the understanding of how the story of Nordkraft is disclosed: If the flavour of the Madeleine cake and tea is linked to the smells, warmth and light of summer Combray; what sensory experience is the coldness and timbre of the Kettle Hall linked to?

Because of the gestures of sensory experience the transformation has the possibility not only to house memories of the past activity within the walls of Nordkraft, but also to let a narrative of authenticity and identity be unfolded. The opportunity allows the transformation to abandon a unilateral approach and embrace a diversified story of larger scale.

Standing under the concrete funnels of the Kettle Hall and sensing the rough tactile industrial architecture vivid pictures are undoubtedly unfolded. Could the nature of these pictures abandon the state of present and past in isolation?

The Madeleine and Combray are not isolated in space and time: The first is enveloped in the second and the second in the first: The flavor of the cake no longer belongs to the cake alone and the color and temperature of summer do no longer belong to Combray alone; they have become internal in a concerted relation and the present is therefore no longer separable from the past.

It seems that the gestures of sensory experience in the transformation are not aimed at or limited to a specific memory of Nordkraft as the regeneration embraces a wider narrative: By the implementation of the possibility for reminiscences of an array of industrial architecture the story of Nordkraft is no longer an isolated story of a single power plant of the past, but rather the story of the identity of a city: As the sensory experience of the present Nordkraft is not limited to open up connections to the past of only Nordkraft – the reminiscence holds the possibility of vast different memories to be unfolded. It is not only the self-contained story of the now long gone chimneys of this specific power plant - it is the story of the heavy smoke rising from the whole eastern part of Aalborg through decades. It is not only the story of the single worker handling the coal on the quay next to Nordkraft in the light of the rising sun – it is the story of generations of workers in the early hours of day on their way to the factories of the heavy industry in Aalborg. It is the possibility for reminiscence to engender the city's past as an industrial centre – and for this consciousness to settle as the city builds on this local identity in a further development through regeneration.

The story of Nordkraft and the identity of Aalborg are through reminiscence an ideal reality or virtuality; an essence incarnated in the involuntary memory. Or with the words of Proust: *"Real without being present, ideal without being abstract."* [16]

Pallasmaa has in his phenomenological writings addressed the connection between memory and the physical sensory experience of perception. He states that the connection of perception and memory plays a significant role in the way a place is experienced as humans have an innate capacity for remembering and imagining places. According to Pallasmaa this ability allows our perception to constantly interact with memory, and in this process fuse the domain of the presence into images of memory [17]. It is this ability of the human existence that allows the involuntary memory to create a realm of amalgamation which embraces past and present in a joined narrative of time and authenticity, or as Pallasmaa states: *Images of one sensory realm feed further imagery of in another modality. Images of presence give rise to images of memory, imagination and dream* [18].

For the architectural heritage of the industrial buildings to play an active role in the future cities it seems that the idea of a passive conservation could be abandoned in favour of regeneration through

emphasis on sensory experience. Authentic vocation is needed for the dissemination of the stories of the past not to linger in a state of hibernation, but to be vividly retold. For the memory of the past to weave around the present a call for sensory experiences is needed: Intrinsic in the transformation and regeneration of the buildings of the past is the possibility to unfold the play between sensory experiences of the present and an effervescent stream of memory of the past. Regeneration of the tangible and intangible cultural heritage in industrial architecture is not a matter of inactive conservation – it is about releasing memories through an active transformation based on sensory experience.

CHARACTERS OF THE RURAL HERITAGE IN THE VAR

Laura BLOTTO¹

⁽¹⁾ Assistant Professor of Drawing and Representation, Politecnico di Torino Department of Architecture and Design - Turin, Italy
laura.blotto@polito.it

Abstract ID106

The study aims to analyze the architectural structures closely related to the agricultural world in the Var, with particular regard to all those accessories buildings in the service of land use. The landscape of Provence verte is composed of a mosaic of territories between them very different. Each of them has its own individuality which is determined by many factors and these include geographic configuration, culture, activities that take place there. But it can warrant recognize some recurring element that creates the unitary of the whole territory which identifies, for example, the organization of buildings for rural activities in the maintenance of agricultural land, forest and pasture with the use of materials found in site and using construction techniques of ancient memory that are handed down from generation to generation. It is noted that the work of man is always in harmonious relationship with the natural environment and respectful of its laws. Agricultural structures, abandoned or mutation of use, represent a point of reference for the evaluation of the characters and values of a territory. The analysis, aimed at the preservation of historical and cultural sites to allow us to acquire useful to identify strategies for upgrading a view to sustainability. The above also directs us towards the planning of possible tourist paths aimed at rediscovering the rural landscape understood as a laboratory of knowledge. A local project can only start from a new-found ability to read the territory as a whole, in the historical configuration, sacral, economic.

Keywords: heritage, rural, Provence.

1. Introduction

The human presence in the area, named only recently *Provence Verte*, is very old. In each age, physical, climatic and socio-economic factors have an impact on housing systems, ways of appropriating the space and adapt to the environment. The first traces of human presence dating back to the Neolithic period (sixth to third millennium BC). The remains that have come down to us are based on findings of the villages in the plain, of cavities inhabited placed on the slopes, of dolmen or burial caves, which are present on the hills in the heart of the massif of Mours. Larger agglomerations, which date back to the Iron Age, called oppida are sometimes the source of medieval castles or are the first groups of houses in the villages today. The historical events that have marked this area refer to the Gallo-Roman invasion of the Saracens in the tenth century until independence of Provence. During the period described so far, we passed by the oppida to fortified castrum, up to a profound change in the distribution of the rural population and no doubt of land tenure and land use in the Later Middle Ages. Nevertheless, we observe that in surveys conducted building materials are always the same: simply pushed together and used more carefully and taste. The roots of the housing systems in *Provence Verte* are derived from and directly connected also to the historical events that

led to choices of place, form and use. What we see now the built environment, grouped or scattered in the countryside, is roughly dated from the XVI - XIX century, everything is related to a set of oldest realization works that testify to the continuous use of the land, aim to global organization of areas: terraces, retaining walls, roads and paths, wells, religious sites, bridges. We observe that all the activities such as agriculture, herding, hunting, extraction of stone materials etc., held for centuries on the same places. Even the traces of several roads have remained in the same time, also with slight modifications, from the time of the Romans, an example is the D7, ancient Via Aurelia which connected Italy to the south east of France.

2. The rural architecture

Running through the history of rural architecture there were two types of construction, the first consists of grouped habitat and the second habitat scattered on the ground, and it is on this that is given attention. These architectures arise during a relatively calm and prosperous, where the population settles in the plains and seek to acquire, including through deforestation, new territories to be used for agricultural use. As we have pointed out, this happens in the seventeenth and eighteenth century, the era in which the buildings line the essential characteristics that will result in the determination of an architectural style (the style of Provence). Several studies have been done to define the types of these rural architecture, including quote certainly the most important due to the Comte Lanery d'Arc. The author has conducted its own investigation with acute analysis by offering a very truthful about the existing situation.

The Encyclopédie départementale des Bouches-du-Rhone (1920 - 1924) contains the definition of some typical homes and refers to studies of previous author, but with significant additions. The study of M. Fernand Benoit in his book Provence et Le Comtat Venaissin (1949) gives us a reading on the structural development and way of living the Provencal house.

More recently still remember the work of R. Livet (1962) on the Lower Provence, which describes the main types of agricultural products.

The multiplicity of these buildings scattered throughout the area obliges me, for reasons of space, to restrict and limit exposure to some types that are identified in the "cabanons", the "pigeonniers" and "puits".

2.1 The Cabanons

In all ages the *cabanon* were an integral part of agricultural life. Often having to travel long distances to reach the fields, made it necessary to have a shelter in the workplace to be used for storage, temporary housing, place of storage of goods. Some are located on the edge of towns and cities, they still serve today as storage for farm implements. As of the end of the nineteenth century, they tend to become a place of secondary residence refuge on Sunday in search of coolness and tranquility. The examples concern *cabanon* in a single room, a square or rectangular plant, with small dimensions and when two rooms with mansard roof. The simplest type is composed by an elementary volume of the dimensions that are around 25 sqm. The orientation is generally south while the cover is in two flaps (even if they exist at a single, but are less frequent) (fig. 1).

Fig. 1: Cabanon in Valensole.

Fig. 2: Relief of one room Cabanon. (Design Claude Poulin)

The openings are present only on the south facade. The input port, to a single swing, leads to a single compartment and is accompanied by a small window. The presence of two doors generally indicates the existence of a deposit or a stable (Fig. 2).

To allow the temporary employment *cabanon* consists of two rooms, one of which is arranged to live with a table, fireplace, shelves for personal belongings and, at times, there is a small wooden staircase that leads to the room in the attic (Fig. 3).

Everything is organized as reduced-scale reproduction of the typical Provencal mas. You can find these buildings in the same building techniques of the main house, but with some simplifications due to lower volumes. They are made entirely of cut stone in the regions where there are quarries (can you say in almost the whole of Provence) and then include stonework, frameworks of doors and windows, etc.. The coverings are tiles and inside is lime plaster, plaster and whitewashing or painting lightly decorated.

The construction of a *cabanon* is closely linked to the presence of water in its vicinity: then springs, cisterns or wells sometimes more frequently integrated into the architectural mass.

The presence of a fireplace indicates the space inhabited by man, usually placed in a corner of the room and is sometimes combined with a stove that allows you to cook food. When in addition to being used as a store and also temporary habitation, externally is planted with essences can provide shade and coolness in the warm periods. Are also included pergolas with fruit trees and flowering - decorative such as wisteria. Often are located on terraces of dry stone connected to retaining walls of the hills, becoming an integral part of the landscape.

We see that these buildings are susceptible to internal changes and volume. Very often the tires are prolonged or undergo elevations. Evolutionary changes, which start from a simple volume basis, allow us to say that these modest buildings are responsible for housing complex (urbanistic laws permitting).

Fig. 3: Relief of two rooms Cabanon. (Design Claude Poulin)

The *cabanon* are particularly representative of the rural environment, Provence is dotted with plenty of both to the limits of vineyards planted that close to the woodlands or uncultivated. In addition to the aforementioned responsibilities to care for the tools, livestock and men, it is also a place of entertainment where you meet regularly families, friends or rendez-vous of hunting. Throughout the period of these historical artifacts ranging notions of work and fun. These two realities are tangent: the first means the daily work, the second leads us to a place that stands out from the obligations of everyday life. This duality to use leads us to a different interpretation of the spaces where the covered meets the needs of agricultural and became auxiliary to the convivial situations investing preferably outside.

2.2 The *Pigeonniers*

In Provence the pigeon lofts are an important element of rural architecture. There are very few farms that do not possess, and their presence, a variety of construction, floor plan give a certain personality and character to the building complex in which they appear. When they are located outside of the housing setting their structures rise majestically on the campaign featuring the perception of space (Fig.4 - 5).

Fig. 4: Pigeonnier of Boudin – Saint Croix (photo L. Blotto).

Fig. 5: Pigeonnier near Banon (photo L. Blotto).

Fig. 6: Relief of pigeonier - Puyvert. (Design Claude Poulin)

One wonders why their presence is a constant of the territory taken into consideration. Their usefulness lies in the fact that in ancient times was often difficult and, in the countryside, regularly obtain fresh meat (Fig. 6). The pigeon could fill this gap for most of the year, the pigeons also produce useful fertilizer for agricultural production. At present the reasons for this type of farming are practically ceased and the phenomenon has been drastically reduced.

Fig. 7: Relief of pigeonier of Grand - Seuil. (Design Claude Poulin)

Generally the pigeon houses are built in areas dominant and in places discovered in such a way as to facilitate the birds recognition of their home. The exposure of the openings is facing east at the first rays of the sun. The criteria are based on the construction and moisture protection from attack by predators. The first case is obvious building nests in not less than 1.50 meters from the ground level.

To protect against mice, martens, weasels, etc.. are applied to the devices to prevent the edge from both inside and outside. Inside doors with well-jointed, wooden ladders to reach the upper floors, plaster extremely shaved and smooth. Outside the openings can be protected with sheet metal, tiles protruding, smooth and glazed tiles on which animals do not have any grip (Fig. 7).

The pigeon isolated are generally developed on three floors: the ground floor can be used as a chicken coop, the second floor is reached by an external staircase and serves as a storage, the latter is occupied by the birds with their nests. They can be shaped square or round tower, their surface can be 15 - 30 sqm. and reach heights of 8 to 15 meters. They can accommodate a few dozen to a few hundred niches made up of small ceramic vessels attached to the wall. The dovecote of Brue Auriac is the most amazing area, its height is 23 meters, the diameter of 12.60 meters and is home to 4,000 nests. These buildings are become obsolete, in some cases, restored and civilized, but most vernacular heritage is a disused and abandoned to itself.

2.3 The Puits

Among the elements that visually emerge in the Var region are the wells. These structures can capture water directly from the water table and the depth of their cost on average around 10 meters, but there are also a depth of more than 20 to 30 meters. In areas highly springs, for example near Brignoles, Le Cannet, Le Luc and Vidauban just dig 4 or 5 meters. In cases where there is an undercurrent, the power is supplied by infiltration of rainwater or the load in excess of waterways bordering. The structures are then called "aiguier" and may be used only seasonally. The structure of the pit rises from the ground to about 1.50 - 2 meters in height and equally in diameter. The walls are made of stone or brick and mortar, topped by a small dome, sometimes covered by majolica glazed features bright colors, this is often a plaster curled. The opening frame is made of cut stone or bricks very similar to the doors of the villages or *cabanon* (Fig. 8 – 9). The wells without coverage are rare, appear to suggest a structure in ruins. Inside the bars are applied to suspend the pulley and there may have shelves or niches to support the bucket or to keep food cool. Often are located outside tanks for watering animals, to maintain coolness and shade trees are planted leafy. Well construction is entrusted to skilled workers who must ensure, with their skills and experience in the installation of stones, a good functioning.

On the use, we can say that a well generally belongs to one owner, at least this is the case for the majority of existing wells in nature. However, it is admitted that a wanderer can draw water and respect the elementary rules which put in place the bucket and close the door in effect in private has a public function regulated by local customs and practices. When they are in common use can access all even if they are on private land, which is within the urban area, in the countryside or on the hills. In the villages, the wells are open to all under the control of the community. In the countryside or the hills are wells for the watering of livestock transhumance in particular. The wells of Saint Peyre in Camps-la-Source and Brusquet - Bras are two examples of places watering statute Community plain. The first is certainly the most mentioned in the archives of Camps, and Besse and Flassans since 1739.

Fig. 8 - 9: Two wells in Carces.

Fig. 10: Relief of a well on a terrace. (Design Claude Poulin)

The use of private or community is also applied to the water tanks. The general rule is that the water is free to use and that this accessibility is a normal corollary to the free movement of persons. Unfortunately, this accessibility is compromised by the poor state of the reserves, degradation and abandonment of wells and last but not least the acts of vandalism, the appropriation by individuals or local institutions (Fig. 10).

Fig. 11: Rural architecture in Provence. (Watercolor Remi Kerfridin)

3. Conclusion

Through the way done so far has emphasized the harmony that binds man to the environment in which they live. The bond is strengthened through architecture, built with materials found on site, which is covered by its values, culture, traditions, needs and experience of generations. Modern man occupies the same territory, but no longer has the same motivations, often constructed by inserting architectural elements in a Provencal style to be in tune with the place, but forgetting the culture and long history that determined the forms. The analyzed rural architectures are the most telling example of the integration of building in the habitat, it is characterized by simplicity and volumetric proportions that are always in relation to the human dimension (Fig.11). Looking to the future, in terms of sustainability and development and enhancement, for new construction projects in the territory of the Var is necessary to look at the European Union directives on the landscape. It stressed the strategic role of the citizens: *"the reinforcement of the relationship between citizens and the place where they live, they will be able to consolidate their own identity, that the local and regional diversity, in order to realize the personal point of view, social and cultural. This realization is the basis of sustainable development of any area under consideration, since the quality of the landscape is a key element for the success of economic and social initiatives, whether private or public."* A "local project" can only start from a new-found ability to read the territory as a whole, in the historical configuration, sacral, economic. We can say that it is the local memories to strengthen the sense of belonging and the study of existing rural buildings can be a stimulus, a useful means of an approach to design and operational objectives in the context of landscape and community.

PERMANENCES AND MORPHOLOGIES OF HISTORICAL LANDSCAPES. THE HILL OF THE VOMERO IN NAPLES

Maria MARTONE

Dip. of History, Drawing and Restoration of the Architecture, University Sapienza of Rome
Rome, Italy
maria.martone@uniroma1.it

Abstract

The historical iconography of Naples until the end of the nineteenth century has reproduced the image of a seaside town surrounded by green hills in which they were built next to houses, villas and small rural centers, great architectures such as the Castel Sant'Elmo with the Certosa, the Palace of Capodimonte, the hermitage of Camaldoli. Subsequently, the landscape of the town has changed: it has intensified the building fabric until to endanger a cultural heritage of world renown.

The hill of the Vomero was the one that more has lived important changes that have led to a strong alteration of its original configuration.

The paper aims to identify, through a collation of historical views and topographic maps with cartography latest, several surviving elements of historical landscapes that no longer exist in an area that has over time changed its activity from agricultural to edificatoria.

Particular attention will be paid also to the identification of the ancient footpaths that connected the city to the hill of the Vomero, still present in the urban fabric as the ascent of Petraio and of S. Francis and the Pedamentina. These small streets, no longer having the original function being changed over time the road system of the town, tend to degrade more and more.

The objective of this paper is to expand and sustain the processes of knowledge of the cultural identity of a place to help to conserve memory and to safeguard the cultural heritage in danger of disappearing forever.

Keywords: landscape, town, territory, architecture, safeguard.

1. The hill of Vomero and its historical landscapes

The orographic configuration of the territory has greatly characterized the city landscape in the course of its history. Naples has developed reclining on a soil that had plains and hilly areas marked by watersheds, ridges, ridges and scree with a road system through which was passed in a small space a difference in height of about two hundred meters. From sea level you could climb up the hill through streets that reflected natural trails also beds of rivers that once flowed down the slopes of the hills. Not only roads, but also cupe, cavoni, strettolè, vichi - that is narrow roads and uncomfortable embedded in the tuff, tuffaceous natural cavities - formed a mesh of paths that branched off on the hill linking the various countries present on the hills until it reaches the town plain. This network of connections road, partly survived to historical events, it is now difficult to read in the present fabric of the city, because overwhelmed by new roads and new buildings that over time have been made. In the landscape of the hill we read a layering of architectural and urban elements through which they could look back at some of the main stages of the history of a territory that was born in almost independently from the city below and, that over time, it has become part of the town. In this study, which is part of an ongoing research on the Vomero hill, the historical cartography and the iconography views play a particularly important role becoming an essential tool through which to recognize the signs that have survived to the transformations of the hill. These signs take today an added value witnessing to the persistence of historical landscapes [1].

1.1 The landscapes along the Roman road "per colles"

The range of hills that surrounded to the west the plain where stood the city of Neapolis, starting from Posillipo and including the Vomero and Antignano it was called in Greek age with the only name "Pausillipon". In particular, as well as historical sources attest, was dedicated to Zeus the hill where the castle of the Elmo built later, while to Hera, the goddess of the woods, was dedicated the hermitage of Camaldoli that rose more inside aimed at the Campi Flegrei.

In Roman age the Vomero hill, indicated by the name of Paturcium from Patulcius, epithet of Janus, the god to which the hill was dedicated, was crossed by a road, already present in Greek age, that "per colles" connected Puteoli with Neapolis. This road, from Pozzuoli, flanked the Solfatara, followed the current provincial S. Gennaro and from Via Terracina continued towards the Canzanella and then along the ridge of the hill of Vomero with via Belvedere and, after reaching Antignano, it went in the via Salvator Rosa, once said the Infrascata. Hence following the Cavone arrived to the door Cumana, at St. Domenico Maggiore. Another road, always coming from Pozzuoli after passing the Posillipo hill, continued downstream of the range of hills toward the Riviera and proceeding in the direction of the valley of Chiaia reached the port. In the Augustan age the tuff ridge of the Posillipo hill was overcome with the realization of the Neapolitan Crypt, which linked Pozzuoli to the coast of Naples [2].

Along these roads developed an extra urban expansion phenomenon. Numerous archaeological findings witnessed a substantial residential development especially in imperial age, constituted by the presence of patrician villas in the area of Posillipo and Marechiaro. Rural houses, however, were found in the territories of Annianum (Agnano), Antinianum (Antignano) where itself developed the "praedia Roman" that is farms whose tree crops became an integral part of the agricultural landscape.

Ruins of a Roman Columbarium, formed by a structure in "opus reticulatum" with eleven niches for the ashes of the dead, are still visible in the last stretch of the via Pigna, at Soccavo, and unfortunately are in a complete state of neglect. Along the road "per colles", in the tract subsequently indicated in the historical cartography with the name "Infrascata", was found during the works of construction of the subway station hill a masonry structure with arches from the Roman era. Some scholars believe should belong to an aqueduct that carried water in the Flegrea area, while others say may constitute part of a viaduct of the old Roman road.

The road "per colles" was named Antiniana, around 100 AD and measured 10 miles. Along the way were also found certain milestones, then go lost, and only one, two meters high and ninety centimeters in diameter, is kept in the Archaeological Museum of Naples [3]. The way to "colles" became the main artery of a road system that began to develop in the area, even pushing inside to reach areas once uninhabited and uncultivated that stretched on the surface of the vast hilly plateau (fig. 1).

By the view of the city of Naples of the Flemish Stopendaal of 1653, drawn up on the basis engraving

Fig. 1: *Plan of the city of Naples* (detail), G.A. Rizzi Zannoni, G. Guerra, 1790. In evidence the main villages and the roads "per colles" and to Chiaia.

Fig. 2: *Napoli*, Bastiaen Stopendaal, 1653. In evidence the hill system of the city and the two roads connecting Neapolis with Puteoli.

Baratta, of a few years earlier, you can locate the system of hills crossed by the road "per colles" [4]. The town, drawn with its villages and its surroundings: from the coast of Pozzuoli to the bridge of the Magdalene, is shown in pseudo perspective with a view at the top of the sea with the intention of representing the city with the surrounding area. It is known, in fact, that with the topographical view of Alessandro Baratta, to which the Dutchman refers, itself consolidates this type of representation which shows the most typical and evocative sides of the landscape of the town (fig. 2).

1.2 From medieval rural landscapes to those of villas extra urban of the eighteenth century

The agricultural peoples who once lived scattered on the hill, located outside the city walls, in the medieval period, when there were frequent invasions of neighboring populations, gather, for reasons of defense, forming the first houses that are built around or to a religious complex, or a palace-castle or even along the road linking the city [5]. Those closest to the city center were called "state-owned" and depended directly by the king as opposed to those more distant called "feudal" who were subject to their own baron. The landscape of the hill remains, at this time, still mainly characterized by areas overgrown by wild wooded areas where you can already find some orchards and gardens for the direct cultivation of agricultural products to the supply also to the city, especially in the area above the current via Roma. The vine was cultivated very much and the farmers drew from it the greatest profit.

The slopes of the hill of Vomero begin a gradual transformation with the planned expansion of the town made by the Angioini and especially with the construction of the Carthusian cloister in 1325, built next to an existing tower lookout. Works were carried out for the construction of earth movings to build roads of and terraces, to drain and regulate the course of rainwater, creating thereby a new aspect to the morphology of the place. Then, the construction of the Angioino Castle of Belforte near the cloister represents the formation of what will be the distinguishing element of the landscape of Vomero hill in the following centuries until today. To allow the construction of the monastery were built some paths and climb including the "Pedamentina" whose very picturesque route has been preserved until today.

In the fifteenth century the Vomero hill is beginning to be seen and appreciated for its characteristics of healthy and pleasant place away from the chaotic environments of the town of the plain, from whose heights was possible to observe the gulf of Naples with its islands and the volcano of Vesuvius the mountain of Somma. The beautiful scenery that can be perceived from the hill and the wealth of forested areas become attractive elements for the nobles of the town which build at Vomero residential villas surrounded by greenery in those places where you can also view the surrounding landscape. It's the case, for example, of the villa of Giovanni Pontano, politician and humanist who worked at the court of Alfonso of Aragon, characterized by extensive gardens and orchards. Built in the Antignano village, the villa is now part of a curtain of houses that looks out on Via Annella di Massimo and the presence of a plaque on the main facade recalls his illustrious owner.

The function as a place of rest, leisure and holiday, that the system the Vomero hill began to take on, had grown stronger in subsequent periods when next to the ancient peasant farms were built residential villas on the slopes of Vomero hills by nobles as their second homes. In the early sixteenth century in the iconographic representations of the city appear, in fact, the first buildings that characterize a landscape up to that time of the whole rural.

We also recall another urban phenomenon which decreed an increase in the urban fabric of the hill. It is the plan of expansion of the town commissioned by the Spanish domination that lasted until the end of the sixteenth century when it was forbidden to build at Castel St. Elmo and on the slopes of the hill. The plan of the Lafrery of 1566 brings us to the image of an agricultural landscape of hills formed by rows of trees placed along large areas of farmland. Thin dashed lines and parallel lines represent

Fig. 3: *The city of Naples* (detail). E. Duperac, A. Lafrery. 1566. In evidence some of the farmhouses and villas on the hill of Vomero. Right: a detail of the design of the hill.

ordered crops, while in the case of maximum gradient we find dense groves. It is recognizable the stretch where the road "for colles" splits into two branches, one to Antignano and the other towards the hill of San Martino from where the path of Pedamentina is recognizable by its many bends. Scattered in the green slopes of the hill and also on the way to "colles" we recognize the drawing of small farms (fig. 3).

The landscape of the hilly area of Naples at the end of the sixteenth century was characterized by a great emergency architectural consisted by a monastic settlement dating back to the late Renaissance, linked to the monks of St. Romuald coming from a town in the countryside of Arezzo called Camaldoli. On the hills, which then took its name of Camaldoli, was built by the architect Fontana a hermitage, founded by John Avalos son of Alfonso of Aragon in the medieval village of Nazareth, as can be seen the landscape painting of the time.

The plague of 1656 led the nobles to move into their hillside villas and thereby to strengthen their presence becoming more stable since then. It was intensified the hilly road system and were opened up new avenues for the Vomero like that of the Infrascata, now Via Salvator Rosa. Made around 1560, the road followed the path of the ancient road "per colles".

At the Vomero settled celebrities of the intellectual class of the time and many noble families, as well as the Celano reported in the book "News of the beautiful, ancient and curious of the town of Naples." The author wrote: "the village of Vomero was once famous for the villas of famous writers and barons of Naples. Leaving the porticoes of the Panormita and Pontano, Pietro Giannone and Salvator Rosa will remember that in the sixteenth century our fathers marveled visiting the casino (as here called and call the holiday homes) of the Marquis of Ferdinand Vandeneynnden ". The Celano continued in the description of the villa where the project was entrusted to Bonaventura Presti [6]. Recall that in 1688 after the death of the Flemish banker the palace, became Villa Carafa of Belvedere, turned into a magnificent villa with large terraces and balconies overlooking the Gulf of Naples. Many other nobles including the Donzellis, the Dukes of Regina, the Salves, the Count of Acerra, the Giordanos, the Ruffos di Sicilia, the Marquis De Mari, the Marinis of Genzano, the Cacciottolis and many others with their villas intensified the building fabric vomerese enriching with imposing architecture the hilly landscape in the eighteenth century (fig. 4). In addition to the suburban villas sprang up many religious complexes among which Santa Maria of the Libera in the sixteenth century in via Belvedere - around

Fig. 4: Naples. Some villas at the Vomero. From left: Villa Belvedere, Villa Salve and Villa Giordano.

which developed the first settlement of Vomero - and Santa Maria of the Soccorso at the Arenella of the seventeenth century which represented the first parish on the hill.

As is known, the "Topographic map of the city of Naples and its contours" drawn by Giovanni Carafa, Duke of Noja in 1750 and ended in 1775 after seven years of his death, represents in 35 tables, with minutia of the details and with the topographical precision, the territory of the city of Naples and its suburbs as it existed in the eighteenth century.

2. The road "leading to the Vomero" and the old villages of nineteenth century

In his routes of crossing of the city, Celano describes "the road called the Vomero" as "rich in monasteries and beautiful casini, to be salutary air having a look at the sea" and still defines the farmhouse Vommaro as "a place rich in fertile gardens and vineyards where you collect fruit in all goodness and delicate wines."

As you know the name Vommaro, as well as the same Celano says, probably derived from an ancient game that the farmers in the hills of Naples were usual to make with the plow, called "vommaro". It was customary to compete for reward those who managed to make straight furrows "having the view obstructed by a cloth attached to good sticks."

In the nineteenth century the main villages that consolidated their presence in the hilly system were those of the Vomero, Antignano and of the Arenella around which soon joined a number of smaller villages. The road system of crossing and connecting the hill to the city were mainly from the ancient Roman road that came from Pozzuoli and near S. Stephen took the name of "the road to the Vomero" as can be seen from the plan of the Duke of Noja. This road in the vicinity of "Casale said Vomero" was divided into two branches. The first towards north in turn was divided in other two branches leading respectively to "Casale said Antiniano today Antignano" through the road of Antignano (the current via Doria and via Annella of Massimo) and to the Castle through a road called still "road of Vomero" and then after changing the direction of 90 degrees took the name of "road leading to the castle." The second branch, which still retained the name "Road Vomero" led directly to the Castel St. Elmo along the current via Cimarosa. From the village Antignano branched three ways: "the road leading Arenella," "the road of the Puntellate Houses " and "the road of the Infrascata" that at the end of his long journey leading to the town of the plain.

By overlaying the ancient road network on a topographic map of the current city of Naples you can identify the ancient tracks of the road that, while retaining the original route, have lost as a result of urban transformations of the late nineteenth century and those still later, the territorial value of a time (fig. 5).

Fig. 5: *Plant Naples* of Turing Club Italy, Edition of 1975. Original scale 1:13.000 (detail). In evidence the major road network in the beginning of the nineteenth century in the Vomero hill with some of the main villas and farms.

2.1 The Village said Vomero

The village is located in the Vomero around the church of S. Maria della Libera, as can be seen from the map of Naples of the Duke of Noja and from that drawn by Rizzi Zanone 1790. Subsequently with the name Vomero pointed most of the hill that the Romans called Paturcium.

From S. Stefano square began "the road that leads to the Vomero" that, following the crest of the hill was a lookout over the city and towards the sea and towards the valley flegreo or rather the plain of Fuorigrotta bounded by the hermitage of Camaldoli. The route of the road is recognizable today in the last stretch of the course Europe and in via Belvedere that evokes only in place names the scenic location that had once the road. Before going any further into the interior of Vomero is opened a small and narrow road towards Soccavo, the current via of S. Domenico. Along course Europe are still recognizable in the urban landscape the villas Salve and Ricciardi that have retained the characteristics of their position and exposure in an area hard hit by a violent urban development. Villa Salve subsequently also called Winspeare villa, partly renovated, has retained its original eighteenth-century type with belvedere tower and large terraces that open on the side facing the sea on a terraced garden planted with vines. The Ricciardi Villa was built in the nineteenth century on a land that was part of the Hortus Camaldolensis that stretched from Camaldoli to Soccavo; now houses a school for the blind and is part of a park much smaller than the original one. Belonged to the large estate of Camaldoli also the farm of Miniero of which remains still visible the entrance on via Tilgher near the stadium Collana. Another farm that is still present and recognizable in the building fabric of the neighborhood is that once called "the Pagliarone" in which several structures are in a state of decay along Via Belvedere, road that is the heart of old Vomero. In front of the farm is the villa of the dukes of the Regina, built in 1579, now the site of a school. A high metal gate delimits the property. Continuing via Belvedere in a small square there is the sixteenth-century church of Santa Maria of the Libera, the village church, the parish auxiliary area of Santa Maria of the Soccorso at Arenella. Many villas were built along this road couching on the slope of the hill. Visible from the street was, in fact, the only entrance to the property which they then reached the villa through a long avenue. With this typology were built Villa Giordano, a time Duchalot villa which was built where stood the convent of San Francesco di Paola in 1585 and the villa of Belvedere Carafa principles. This villa retains its plant of the seventeenth-century with a large exedra of access to the building in which is conclude the long driveway from the road, where it repeats a semicircular-shaped building (still preserved) made to allow the carriages coming from the villa to turn. From via Belvedere began two streets: one called vico Acitillo that connected the village of Vomero to road of Puntellate Houses that led to Soccavo and the other Calata St. Francis leading down to the sea.

The village of Vomero, that in the nineteenth century was enriched with villas and palaces built until the early twentieth century [7], has lost its aristocratic character after the Second World War when they were built popular houses too, following the expansion of the city "like wildfire." The road Belvedere, which is saw the sea, has turned into a straight and narrow road where few elements, such as the exedra in tuff at the entrance of the Villa Belvedere, remind us of a historical urban landscape that barely survives, risking of disappearing in a short time (fig. 6).

2.2 The Village said Antiniano

It already existing in Roman age under the name of "Antinianum" the village is the oldest of the hill and has always been an important urban node into which flowed roads in different directions in the area from which you reached the other villages sprung up in the hill. Important station for the Roman road that led from Pozzuoli to Naples town center, the village was in the nineteenth century an important point of duty Bourbonic, as can be seen also as a tombstone still preserved on the facade of a building in the main square of the village Antignano. The building still retains its characteristic front with two arches openings to each floor which form a large balcony, while on the ground floor the arch

Fig: 7 *Plan of the city of Naples, the Duke of Noja, 1775, detail of Antignano. In evidence the main roads, villa Pontano and the church S. Gennaro. Right: Largo Antignano, today.*

delimits the entrances to shops (fig. 7). Since ancient times, the village of Antignano, always very crowded for the ancient presence of a rich market that still characterizes the neighborhood, has been linked to the cult of St. Gennaro. Three churches dedicated to the saint were erected in this area. The oldest S. Gennariello dating from the twelfth century was built on the spot where it happened for the first time the miracle of San Gennaro.

2.3 The Village said Arenella

From Antignano started one of the oldest streets in the hill "Arenella the road" that led to the church of S. Maria of the Soccorso, coming to the valley of the hill of Monte Donzelli. The rural path on which looked farms and noble palaces currently corresponds to the streets: via Arenella, via D'Amelio, via Rocco and via Mazzoccolo, along which are still recognizable historical houses and old farmhouses renovated. In Via Rocco, for example, a beautiful portal in piperno, at number 44, still has at its top a coat of arms (fig. 8).

The village Arenella was connected with the town of the plain through the "Salita Arenella" that after passing a drop of about 20 meters reached the Infrascata, the stretch now called Count of Cerra, to get in the lower town. Along the route there were numerous villas and chapels. The route of the road has been preserved but few are the testimonies of the building fabric that over time has changed. We remember the Garzilli Villa built by the Duke of Polignano Lieto, of which today there are only a few visible remains within a private park. Along the route of the Via Conte of Cerra have recently come to light the remains of a Roman aqueduct and viaduct (subsection 1.2) the presence of which, while strongly contrasting with the modern architecture of the new metro station, helps to identify the urban complexity of the place and its historical stratification (fig. 9).

Salita Arenella continued towards the village Due Porte through "Salita Due Porte" today via Massari and via Presutti.

3. The ancient flights of steps that connected the Vomero to the lower town

The flights of steps, originally made in clay with edges in stones, were developed with paths and steep terrain and from the hill arrived to the lower town and to the sea linking the major monasteries and castles. These paths of ancient origins, the Pedamentina of San Martino, for example, dates back to

Fig: 8 *Left: Plan of the city of Naples, Rizzi Zannone, 1790, detail of the Arenella. In evidence the main roads and some ancient villas and palaces. In the center: Via D'Amelio 75, today. Right: via Rocco 44, today.*

Fig: 9 Via Salvator Rosa (Infrascata way already), today: the subway station. Right: detail of the ruins of the Roman age.

medieval age (subsections 1.2 and 3.1), they were much used by both pedestrians that even the horses and donkeys for the transport of people and goods because growing almost perpendicular to the contour lines or rather along the lines of the hillside, in a short space and time allowed it to overcome a steep gradient reaching the lower town. Later, with the spread of the *pietrarsa*, was used this volcanic material of very dark gray for the paving of the steps, along which developed even small residential areas. The Pedamentina of San Martino, the Petraio and the Descent St. Francis are the pedamentine - a name used to indicate the roads that lead to the foot of the hill - the most important links to the Vomero. The streets bleachers, far from the main roads, became a meeting place and social relations, but also laundry and space for recreational activities, since there is no mediation between private and public space. Today, this relationship is mediated by small porches, shelters and planters that have partially altered the original appearance of these streets.

The "*pietrarsa*" of the flooring, the tuff of the walls of buildings, parapets, retaining walls, the wrought iron and the iron fences, the terracotta of the terraces, the green of the gardens and fruit trees, the blue of the sea in the distance were the elements that characterized the landscape along these sunny walking streets which opened expansive views of the gulf. Everything today is perceived with difficulty because it is not valued the importance that these pathways have had in the history of the town and may continue to have only if it is protected and safeguarded their existence.

Being very limited the activities and commercial craft, the "pedamentine" of Vomero are not very frequented if not by the locals to access their homes. Could be enhanced their use both on the part of citizens and tourists, for which could offer alternative routes through the town to perceive the different landscapes that the town offers.

Are unfortunately absent elements of street furniture with chairs or staging points in order to better observe the scenery of a city that develops towards the sea, nor there are services in order to make easier these streets so special and that could be very useful for a congested town traffic.

3.1 The Pedamentina of San Martino

From the Certosa di S. Martin starts the ancient route of Pedamentina arriving at Corso Vittorio Emanuele from here, through ramps Montesanto, you will reach the lower town. The street that develops on the eastern slope of the hill of Vomero was born as a real artery connecting without following a path of natural water courses, as was the case for many avenues of Vomero. The Pedamentina of St. Martin was in fact built with the purpose of transporting the building material for the construction of the Certosa whose work led by Tino di Camaino and Francesco De Vito began in 1325 (subsection 1.2 and section 3). With the Queen Giovanna I of Angiò there were numerous donations of land surrounding the monastery of the Carthusian monks to the royal families, thus favoring a first urbanization. The Carthusian monastery together with the Castle underwent considerable changes in the Aragonese period, age at which begins the process of building expansion on the hill with the construction of numerous villas and gardens nestled on small hillocks. At the beginning of its construction the Pedamentina, that followed the border of the gardens and orchards of the Charterhouse, was developed primarily with wide turns, as well as in the map of the Lafrery. Only later was constructed a system of stairs always with large steps as well as into the sole of the Duke of Noja. Currently in its path is opened wider perspective views on the ancient center of the city and meet up next to old buildings that are developed by exploiting the natural gradient, buildings housing more recently that, in some cases, are in contrast with the context that seems to preserve the appearance of a village (fig. 10).

Fig: 10 Pedamentina of San Martino. Left: view of the '700, Achilles Vianelli [8]. In the center: Pedamentina, today. Right: plan of the city of Naples (detail) with indication of the route of the flight of steps.

3.2 The Petraio

Originally called "Petraro" to indicate a place full of stones and pebbles, or even "Imbrecciata" , from "breccia" that in Neapolitan means pebble, the narrow steps of Petraio crossed with a very steep path up the hill on the western side starting from current via Annibale Caccavello up to the Corso Vittorio Emanuele. Along the route, which follows the bed of an ancient stream that took away to the valley the water running off the hill, has developed an inhabited nucleus composed of an intense urban fabric of multi-storey houses, low houses, but also small plazas and terraces that overlook the sea. Along the Petraio in the background, between the houses and some of the green gardens, you can see constantly thin scenic views and only in the vicinity of pitches or widening, widening the field of view, we perceive a wide view of the gulf (fig. 11). Along the way there are detached ramps and other slopes that lead into the building fabric and many villas and palaces overlooking it next to buildings also popular. In view of the eighteenth century of T. Jones "The hill of San Martino" is represented the valley of Petraio and a monumental building that still today we find along the way [9].

3.3 Calata San Francesco

Shown on the plan of the Duke of Noja with the name "Street that comes down to Chiaia" the street linked the old Village of Vomero and the sea. Currently the street starts from Via Belvedere and ends on Corso Vittorio Emanuele, after crossing via Aniello Falcone, a time came to the sea continuing with the current "largo Mirelli". Named after "Descent St. Francis" to the presence of a church built in the eighteenth century and then probably incorporated into the villa Giordano, the street has retained its path some buildings that testify to the presence of an ancient urban fabric. In view of the eighteenth century of Giovan Battista Lusieri "Naples from the west" is recognized for its prospectus particular, marked by wide arches, a building that is still preserved along the path of "Calata St. Francis" [10]. Next, the higher is represented Villa Belvedere recognizable from its terrace and the small tower with loggia (fig. 12).

4. Conclusions

The hill of Vomero, once considered part of the surroundings of Naples, has been for more than a century belonging to the metropolitan territory. In this part of town are still present, although hidden, abandoned and not valued, some urban and architectural permanences that evidence the presence of

Fig: 11 Petraio. Left: view of 700 of T. Jones. In the center: panorama from Petraio, today. Right: plan of the city of Naples (detail) with indication of the route of the flight of steps and the palace in the view and the panorama.

Fig: 12 Calata San Francesco. Left: view of the '700, Giovan Battista Lusieri. In the center: Calata S. Francesco, today. Right: plan of the city of Naples (detail) with path of the walking street and the location of the two buildings shown in the view of the '700.

elements of historical landscapes through which they could recognize the signs and the morphologies of a territory which in time changed. Numerous are, scattered on the hill of Vomero and its plateau, the observation points of the city and the landscape where natural and artificial elements are integrated in an unusual harmony not more bucolic as a time but of a metropolitan effect. The landscape, which can be understood as a synthesis of an architectural, urban and territorial reality, testifies with its constituent elements the history of the culture of a people and as such must be protected and safeguarded. It therefore stresses the fundamental role of knowledge as a first level of protection of an asset, be it architectural, urban or landscape, so that we can ensure the preservation of historical memory documented of the civilization to which we belong.

A landscape in transition or a landscape in danger? The olive groves' cultural landscape of Corfu.

Spyridoula Arathymou

Department of History and Archaeology, School of Humanities, University of Peloponnese, Kalamata, Greece

e-mail: pipiar@gmail.com

Abstract

Corfu is an island with approximately four million olive trees. The appearance of olive trees on the island has its origin in ancient times. Olive oil has been a wealth factor for its producers for centuries. Unfortunately over the last 30 years olive cultivation has been almost abandoned in Corfu due to a new source of wealth: tourism. But the olive groves still exist and they have formed a unique landscape of amazing beauty with its own ecosystem. The few ones who are still faithful to olive and the wealth it produces struggle for the survival of this landscape and its sustainable development. The trees are extremely high (from 10 until almost 30 meters tall) and they have to be partly and properly cut so as to become healthier. Some people have tried to do this but it is not easy as the specialized workers for this job do not exist anymore. Locals and generally Greeks do not want to work in the land and so only foreign workers are available for land work and they cannot do the proper pruning as they do not have the knowledge for this. On the same time, various illnesses of the olive take place quite often, the selling price of olive oil is very all ask for wood to keep warm during winter. This last fact gave birth to the uncontrolled cutting of woods all over Greece but especially Corfu is in immediate danger. Police patrols and a lot of arrests take place very often but they are not enough to stop the wood merchants who have a big opportunity to become rich from Corfiot olive wood.

Keywords: olive groves, cultural heritage, natural heritage, cultural landscape

1. Introduction

The facts which are described in this paper have been documented during fieldwork for the research project "The documentation of cultural information used as vehicle for regional sustainable development. The case of olive culture" [1]. A part of the research project is the documentation of the olive groves in Corfu and Messinia as cultural landscapes. Therefore, fieldwork takes place in the olive groves of these regions.

During fieldwork over the last year and before, the first impression was that the landscape of Corfu region is changing rapidly. The island of Corfu is a huge olive grove. It has more than four millions olive trees. The origin of olive tree in Corfu is lost back in time. The historical and archaeological facts show that it has been cultivated since ancient times until nowadays. There are at least two local olive varieties in the island: 1) "lianolia" (meaning thin olive) and "myrtada".

Fig.1 : "Lianolia"

Fig.2 "Myrtada"

Until the end of 80's, olive cultivation was the main activity in the region of Corfu. Most of the region's population was involved in activities related to olive as olive cultivators and olive oil producers, land workers and workers in the olive mills. Until that time, olive oil had a good selling price and it gave a good income to its producers. The olive crop collection method in the region is much different than in other regions. Nets are laid on the ground, covering the fields and the cultivators wait for the olives to start falling down so as to collect them. Of course, olives do not fall all together at once. So, the collection period usually lasts from late autumn until late spring or early summer, sometimes. Cultivators have to watch the olives every day and collect them every time they fall down. This old collection method can be justified. In most Greek regions, olive branches are hit with sticks so as to

make olives fall down and afterwards, these branches are cut so as the trees not to become sick. In order to do this, olive trees in other regions are kept to a certain height, no more than two meters. In the region of Corfu, that has probably the oldest continuous tradition in olive oil production in Greek territory, trees were kept high, to give a lot of crop, but they were always properly cut by specialized, trained workers. Corfu until the early 70's had more than one thousand olive oil mills. Every village had at least two mills in which most men used to work and women were collectors in the olive groves. At the end of the 80's, the economy of Corfu changed orientation. The touristic invasion changed everything. People abandoned agriculture and industry and got involved only with tourism which gave them wealth. Also, the olive oil's selling price started to fall and that was also an excuse to abandon the olive groves.

1.1 Present Situation

Even before the outbreak of financial crisis in Greece, there was noticed a decrease of the income from touristic activities in Corfu. Financial crisis, over the last four years, brought to surface the region's forgotten olive groves.

The Corfiot natural landscape is unique and it has its own unique ecosystem. The hundreds of small villages which were built in and next to the island's olive groves lived and flourished from the olive's cultivation. The local culture is identified with olive culture. The abandonment of olive culture led to the decline of local culture. Now, the cultural landscape of Corfu is in immediate danger. The touristic activities resulted in the forsaking of villages which did not become touristic destinations. The architectural, pre- industrial and industrial heritage of these villages has started to vanish. The folklore cultural elements of rural Corfu are almost lost. The traditional olive's cultivation and production methods will be soon forgotten together with the elder who carry this knowledge. The huge olive trees are dying year by year. The abundant rain water is not enough when they are not fertilized, properly pruned and been taken care of. If collective and well-studied actions are not taken soon, the olive groves will extinct and every natural and cultural local element, as well.

The fact is that a few people never gave up their land during the touristic boom but it was and still is very difficult for them to make a profit from olive cultivation. Of course, the main reason for this is the low selling price of olive oil. In addition to this, there are not local land workers any more. There are only foreign workers available who have nothing to do with olive cultivation and they are not enough, as well. In older times that almost everybody was involved in olive cultivation and olive oil production, there was not a lack of workers and the cultivation and collection methods did not have to change as there were always working hands available. The olive oil mills, before the invasion of the centrifugal method of olive oil production, employed a lot of workers who worked very hard during the olive's collection period. The workers were mostly paid with olive oil instead of money. The profit was bigger for them. The abandonment of olive cultivation and the fall of olive oil's selling price made it very difficult for the few ones who wanted to keep the older types of olive mills open and soon they had to close them down. The olive trees' branches have not been pruned for almost twenty years as the specialized workers slowly extinct. Today, the people who want to continue the olive cultivation in Corfu cannot do it if they do not have a strong financial background from other activities.

Financial crisis urged people who had abandoned their land for decades to see how they can make profit from it. This is impossible without a collective and serious plan. A lot of land owners decided that they had to make their olive trees lower, so as to use the cultivation and collection methods which are applied in other Greek regions, and/or cut their trees down and sell the wood. Since 2011, an uncontrolled destruction of the Corfiot olive groves takes place. Foreign workers who do not know anything about olive trees are hired to cut the olive trees. In most cases, trees' branches are not pruned to make the trees lower but the whole trees are chopped down. A lot of people do not have money to pay the foreign workers or even they do not want to and as a result, the workers are paid with the wood they cut. Usually, they take all the wood and they sell it without giving any money to the land owners. During this last winter (2012-2013), the situation became extremely difficult. The sound of chain saws echoed all over the island. One of the excuses was the extremely high price of petrol for house heating. The fact is that now, most people cannot afford to buy petrol to heat their houses at the price it is, so, they try to find other means. The easiest is the wood. As a result, during this period, there was a huge ecological destruction all over Greece from the illegal and uncontrolled denudation of Greek woods. The Greek state took measures to stop and prevent it but without any substantial results. The wood merchants took advantage of the situation but the truth is that most of the wood is not sold for heating but is exported abroad for furniture. The Corfiot olive groves are protected by the law since the 20's [2] but law is not obeyed. Normally, there is a procedure for the pruning of olive trees in cooperation with the agricultural authorities of the prefecture but rarely one will follow it. There have been armed patrols from the authority responsible for the protection of woods as the foreign workers who cut the olive trees down are usually armed and dangerous. People, even if they want, they cannot report the illegal chopping as they are in danger from the "wood gangs". In some cases,

there have been arrests of olive grove owners and the workers they hired to chop the trees down. But, it is not enough.

Fig.3 An olive grove before illegal chopping

Fig. 4 The same olive grove after its denudation

In this chaos, there is a ray of hope from people who want to protect the olive groves and make profit from them in a proper way. Until crisis, very few people struggled to keep their olive groves alive. The cooperatives split up and so they did not have any help. The Armageddon of financial crisis made people think of the options they have and now there is a tendency to return back to the origins of Corfiot economy, farming and industry. These people, if they do not have a good income from other activities cannot do much. The state has never been helpful and now it is completely absent. They can only rely on funds from European programs and on their creativity. But, all of these people have the same vision: to renovate and reuse the olive groves. There are two tendencies at the moment: the one suggests that the olive trees should be cut at the height of two meters, so as to be easily cultivated and collected and the other suggests that the olive trees should remain high- in order to produce more crops- but to be properly pruned as in older times. The first suggestion is easier than the second and many farmers have already applied it. The second one is much more difficult because it needs workers to prune the trees properly and collect the olives for many months, as soon as they fall. This suggestion can be moneymaking but for the ones who can afford it financially or have working hands available. The people who want to change the situation know that the region's oil used to be one of the world's best olive oils. They want to make their olive oil as good as it used to be. An obstacle to this wishful thinking is the lack, in the island, of modern olive mills – on professional, industrial level- which do not use centrifugal methods for the extraction of olive oil. But this can easily change. Eventually, when more people start using their olive groves properly, the market will adjust to their needs. These

visionaries have a long way ahead as high quality olive oil has been produced for quite a time in other Greek regions and exported, too. But Corfiot olive oil if produced by quality standards can beat a lot of if not all quality olive oils. If the people, who want to make again Corfiot olive oil a standard quality product, stick to it, succeed, this will save the olive groves, as profit is something that everybody wants and understands.

1.3 What can be saved?

Now, there is an emergency for the protection of the region's olive groves. Year by year, the ecological destruction is bigger. The state cannot protect the natural heritage but the citizens are responsible for this situation and so, they are the ones who can change it. A state institute responsible for the cultivation of olive in the region was shut down due to the financial crisis. It is quite improbable to open again and so, a new form of cooperatives has to be established so as to educate farmers and new cultivators and show them their options. The destruction of olive groves is not an option for anybody. Things show that if there are more and more people who want to reuse the olive groves, they will be in conflict with the others who chop them and sell the wood and with their workers, as well. It will not be an easy situation as financial crisis has damaged people's moral principles apart from their savings. To save the olive groves is not only a matter of natural beauty or a financial matter. Above all, it is about saving the cultural heritage of this region, which has been identified with olive culture since ever. The region of Corfu cannot exist without its olive groves.

Abstract

This paper is part of major interdisciplinary research project that promotes the wider dissemination of cultural heritage and sustainable development in Aljezur county that encompasses part of the Portuguese Natural Park of Southwest Alentejo and Costa Vicentina.

We seek to clarify and reinforce the strength and the knowledge about the several dimensions of landscape as heritage which must be continuously protected by law and preserved by men.

We pretend to emphasize and explore the synergies between cultural landscape representation –and landscape production – the physical and material changes wrought on the land, not always with the best results due to major touristic pressures, and the urgent necessity of its preservation as Natural and Cultural European Heritage.

We firmly believe in the need to promote the idea of preserving the landscape through political measures and also to promote sustainability through the opportunities of an ethical model of tourism which may include the use of new technologies to promote the memory of places. This paper, is based upon almost three decades of immersion on local culture that produced a continuous of published and public debated material, focused on the dynamics of cultural change problems that emerged with the local tourist demand and also by the needs of a planning process which promotes and preserves the several dimensions of heritage management and does not ignore men and its needs promoting a wider discussion about the intangible values derived from protect areas.

Keywords: Aljezur, Cultural Heritage, Memory, Tourism, Sustainability

Introduction

1-The Project:

This communication is an integral part of a project I&D **ALJEZUR**, "**between vision**" of Place and **Memory**, which aims to integrate diverse knowledge and expertise towards new ways to approach a tourism based on the preservation of cultural heritage in its various manifestations, contemplating and emphasizing the register of Memory.

The team includes researchers and experts from various fields, from Anthropology, Sociology, Geography, Economics, Arts and Visual Culture, Communication Design, Photography, Computer Graphics and Heritage and involves civil community organizations such as associations for the defence and protection of historical and archaeological heritage of the involved territories. Local authorities were invited to participate, but have not yet committed themselves accordingly.

In this sense, and based on an integrated analysis of the conceptual assessment of sustainable and ethically responsible tourism, we also intend to test a new approach to tourism based on the assumption of the value of the cultural heritage of the municipality of Aljezur and its territories of enormous scenographic wealth, which is protected by decree since 1988 for the specificity and beauty of its landscape and as Natural Park of Southwest Alentejo and Costa Vicentina, aka PNSACV since 1995, but still remains subject to various pressures for mass tourism based on a sun, beach and concrete product similar to the remainder of the Algarve.

Thus, with this our project, we aim to foster academic reflection about the relevance of the need for registration of the Memory and Cultural Identity of places as elements able to promote and develop a model that integrates the development of a cultural and ethically sustainable tourism: another possible tourism, in the context of post modernity and of an economic crisis on a global scale, strengthened by the use of new technologies and on the assumption of the appreciation of the local heritage by its inhabitants, its visitors and the political powers.

FIG.1: **The other Algarve Praia da Rocha** Source: http://1.bp.blogspot.com/-RFUX7ToYdS8/TDzWaT_w0I/AAAAAAAAADp0/oVamUKhkePE/s1600/PTM.jpg

Thus, with this project, we aim to foster academic reflection about the relevance of the need for registration of the Memory and Cultural Identity of places as elements able to promote and develop a model that integrates the development of a cultural and ethically sustainable tourism: another possible tourism, in the context of post modernity and of an economic crisis on a global scale, strengthened by the use of new technologies and on the assumption of the appreciation of the local heritage by its inhabitants, its visitors and the political powers.

Fig 2: Photo by Maria do Céu F. Rodrigues

Fig 3: Photo by Maria do Céu F. Rodrigues

The use of new technologies, based on augmented reality and immersive media, will allow, first, to decrease the environmental impact and ecological footprints and, secondly, to reach out to different audiences, offering specific and customizable means. Thus, the technological resources will be used to perpetuate the different records of the memory and to promote sustainability, using virtual travel between past, present and future.

In our project we also integrate the dimension of the "heritage park, also called eco museum" (Martins and Costa, 2009) that assumes, in turn, the cultural legacy of the landscape and reflects, in its design, the concerns of the investigations focused on transformations of the landscape and its ecological impacts linked to local heritage resources, due to the specificity of the territory largely inserted in the *Natural Park of Southwest Alentejo and Costa Vicentina*, created by law in 1995.

Thus, according to the authors, "the parks heritage by combining natural and artificial values, by rescuing traditional spaces and ancestral activities, by reuniting the balance between man and nature, take on the challenge made by many who defended the ecology of the landscape, seeking to transform the structures built on elements of recovery and continuation of the natural processes (Hough, 1995). This assessment of the concept of a heritage park is also a possible way for the assertion of the identity of a place and concurrently applicable to a territory with the specifics of our case study, integrating the museological dimension in line with the ideological propositions of the new museology (UNESCO, 1973).

Methodologically, the project **ALJEZUR, "between vision" of Place and Memory** that we have been presenting and promoting to civil society since the official Congress of the Centenary of Tourism in Portugal in May 2011, and in several international scientific seminars and conferences will be divided into five distinct phases that integrate the gathering and survey of the various registers of the Memory: from photographs to oral or written testimony associated with social, economic and scenic aspects of the county, its subsequent inventorying, cataloguing and classification according depending on its type and its theme; data analysis, integration of different museum estates or previously catalogued data, and finally the systematization of all collected information's on different means of information.

Our basic intention is to promote and foster the integration of the possibilities of accessing not only goods and products but especially the very spirit of the place, the *genius loci* according to the perspective articulated by Norberg-Schulz in 1980, and to preserve the heritage according to the statement of Quebec of ICOMOS October 2008 which manifests itself not only in location but also in their spatial configuration, and especially in his characterization of articulation between spectator and the place, enhancing the valences of a county located in the south-western region of Portugal and whose territory is mostly integrated in natural park or the Natura 2000 network, since 1999, [1] protected but not immune, to some atrocities that have disfigured and weakened mainly by the excesses of permissiveness enhanced by local political powers and sometimes by its contradictory.

2 - The Place

Fig 4: Vila Aljezur – overview, author : Pedro M.Pereira, photo courtesy ADPAHA

Fig. 5: Algarve region Source <http://www.tintazul.com.pt/castelos/far/ajz/index.html>

Located in the southwest of the Portuguese mainland, in the district of *Faro*, *Aljezur* municipality is bordered on the north by the municipality of *Beja*, to the east by the municipality of *Monchique* and to the south by the municipality of *Vila do Bispo*, a half hour away from *Lagos* and from the other Algarve, the beautiful and magical south, somewhat disfigured by the excesses of a tourism - based on a jaded model of sun, beach and golf, but still an extraordinary area that opens up to the Atlantic and to the influences of the Mediterranean.

Aljezur is in this second decade of this century a socially and economically fragile county, overly aged and depressed, reflecting not only a severe economic crisis affecting the country, but also the loss of much of his identity based on a lost rurality and the inability to regenerate itself thru the immense potential of the landscape and the cultural patrimony of its extensive and diverse territory.

Endowed with a beauty of a privileged and unique flora and fauna, the landscape of the coast called Vincentian in good time was safeguarded by Decree Law 241/88 of 7th of July, that created the protected landscape area of *Southwest Alentejo and Costa Vicentina* and later, in the year 1995, by Decree Law 26/95 of 21st of September, which stipulates and regulates the *Natural Park of Southwest Alentejo and Costa Vicentina*, which came in good time to avoid the total destruction of such a beautiful and coveted landscape.

3 – Sustainability

Conceptually the notion of sustainable development is based on three key pillars which should involve and develop harmoniously together. The environmental pillar should take into account the preservation and enhancement of the natural beauty of *Aljezur* and its territories, while the social pillar should reflect a strong respect for tradition and the resilient populations. Finally, the economic pillar should be managed prudently to ensure the financial viability of the municipality and simultaneously generating new resources. Sustainability is a strategic approach to the integration of conservation and consistent development. It implies the maintenance of ecosystems, the preservation of genetic diversity and the sustainable use of resources. It implies a solidarity commitment with the future. Only in this way a development, able to meet the needs of the present without compromising the ability of future generations to meet their own needs, can be promoted.

Whereas the principles of sustainability are: [2] Prevention, Precaution, Cooperation; Ecological Integrity, Continuous Improvement; Intra-generational and inter-generational equity; Integration, Community Involvement, and Accountability, it is important to ensure the transfer of assets capable of satisfying the needs of balanced integration of the economic, environmental, socio-cultural and institutional aspects of Good Governance. Thus, the concept of Sustainable Development is usually seen as a development that seeks to meet the needs of the present generation without compromising those of future generations. It means to enable people, now and in the future, to reach a satisfactory level of development that integrates also the cultural dimension, making, at the same time, a reasonable use of land resources, preserving species and natural habitats.

4 - Sustainable Tourism

By sustainable and ethically responsible tourism we understand one that meets both the needs simultaneously: those of the tourists and of the receiving regions, protecting and expanding opportunities for the future. It is a tourism that should provide various resources so that economic, social and environmental needs can be fulfilled without contempt for the integrity of cultural identity and the maintenance of ecosystems determinants for ensuring the preservation of the natural environment.

It should be a tourism that takes in consideration the social component, the local environment and the tourists themselves. We believe that it should be a planned tourism in function of not only to meet the immediate needs of the potential spectator but also the protection of the environment; not just a tourism centred on economics and easy profit, but that respects and integrates the human being, the environment and its preservation - always assuming that man is an integral part of the ecosystems and can not be marginalized in this process.

The World Tourism Organization on 27 September 1999 adopted a code of ethics which states that it is necessary to "safeguard the environment to achieve healthy economic and sustainable growth" recognizing and advocating new forms of tourism. [3]

Thus, considering that culture and heritage are important sources of tourist attractiveness and especially factors for the assumption of cultural identity and shared memory of communities and their inhabitants, the option for sustainable tourism development, based on the defence of the landscape and its preservation should take, and reconcile the objectives of maintenance and preservation of cultural identity factors of *Aljezur*, a county that has been pushed for decades towards mass tourism and by the real estate market, but simultaneously is "too" protected by legislation which, in some cases, assumes aspects of castration of the ancestry practices.

Two years after the General Population Census of 2011 the excessive over-aging of the population of *Aljezur* is a potential threat to its own survival as a county, [4] that, according to the potential new autarchic design that is to be expected, could be, in a not too distant future, "annexated" by the nearby town of Lagos. Thus, it is urgent to captivate new populations, creating new services, in which the Touristic and Cultural aspects might constitute the future paradigm, thereby avoiding any territorial and administrative (re)arrangements that do not favour the county and its autonomy in anything and will be contributing more to its marginalization over the remaining Algarve and the centers of power

Fig. 6: : Foto by Maria do Céu F. Rodrigues

The prior announced possibility in regard to heritage parks may be a viable alternative for these territories and could lead to the assumption of the village of *Aljezur* as a structuring place for the appreciation and preservation of natural and cultural processes, as suggested by Hough (1995) and Martins and Costa (2009).

These parks are presented as lasting projects and as perfectly integrated approaches of sustainable local and regional development, enhancing the value of ecosystems and biodiversity but also of social cohesion.

The situations covered in this project, which should be enhanced and extended to other parts of the Portuguese territory, wish to take the reconciliation of the objectives of maintaining and preserving the factors of the identity of the county: its immaterial and intangible heritage (landscape, monuments, flora, fauna, gastronomy, local products, etc..), as well as the everyday use or enjoyment of some of its cultural assets, valuing and optimizing local identities always from a perspective of sustainability.

Thus, by promoting an alternative to conventional cultural tourism which assumes and involves travel, we encourage and rehearse innovative communication strategies and the preservation of intangible heritage through other forms of "Tours" through the recorded memory of the past and also of the present, considering the future.

As mentioned, we have chosen symbolically the centennial celebration of tourism in Portugal for the presentation of (our) project. In this second decade of this century, now as then, we live similarly a particularly complex moment in our history, in the midst of an economic and social crisis that presently can be felt at a global level. However, we believe another form of tourism is possible, as reported by Sergio Molina. [5]

"The post tourism, or simply the tourism in post modernity would result from globalization that brings a more flexible and dynamic appearance and proposes new models of consumption favouring more customized forms at the expense of uniformity."

This is paraphrasing the same author, the new tourism that "goes beyond the Traveller", less linked to market issues, integrating a reflection on ethics and debates about the contexts of post modernity and its paradigms.

The post modern man has to take and integrate the cultural and environmental sustainability and to look for leveraging the experiences of his imagery and imagination which must be speculative, creative, enhanced and supported by the most diverse and complex technical challenges, based on culture and global visual communication which can also transpose the limits of tangibility and thus emerge in various areas in the field of virtuality and the domain of imagination.

We intend therefore to emphasize and exploit synergies between the current representation of the cultural landscape and the landscape as cultural production as well as all the consequent physical and cultural changes that have been causing profound changes in the territory that we have been analyzing, especially the areas nearest to the coastal zone, due to greed raised by its extraordinary beauty and the consequent pressures towards a growth oriented towards mass tourism and strongly based on concrete and lack of identity, promoting discussion about the potential for sustainable development that fosters memory and its patrimonialization.

Becoming the Olympics: The Sound Proof series of exhibitions (2008-2012)

Monica BIAGIOLI

School of Design, London College of Communication, University of the Arts London, London, England
m.biagioli@lcc.arts.ac.uk

Abstract

The Sound Proof series of exhibitions (SP 2008-2012) emerged from an organic process to make artistic contributions in response to the Stratford site of the London 2012 Olympics. Planning for the series began in 2007—at the same time that the official Cultural Olympiad was starting up—and so the archive of yearly exhibitions reflects both changes to site and the evolving mood as the event neared.

The series has heritage concerns at its core—both the tangible cultural landscape and the intangible dimension of memory. Through its thematic funnel linking art practice, curation and legacy, SP created a unique container to address the cultural legacy concerns attached to Olympics sites while placing the focus firmly on the site of London 2012—providing an artistic record from its unique vantage point of independent artist-led activity.

The exhibition programme evolved over time, generating 28 new artworks by 21 artists in 5 exhibitions, 4 exhibition multiples and 1 publication. Exhibition themes were sound as cartography, sound as artefact, sound as text, sound as legacy, and sound as voice.

In its yearly iterations SP is like a memory track of how the Stratford site was building up towards 2012, reflecting a complex layering of moods and views through the filter of artistic responses. The works are part of the public record and contribute to the Olympics' legacy of artistic representations—expressing a wider spectrum of voices in the artistic record of London 2012.

Key words: sound, art, curation, memory, heritage, legacy

1. Distinguishing features of historical memory: An organic process

We punctuate our memories of events by recording them in some form that marks them down for remembrance. With landmark events such as London 2012, the official narrative was threaded through a combination of cultural programmes including invited artists and curators, open calls, and initiatives at the local level guided by the organisers of the Cultural Olympiad. There was a complex, multilayered approach to London 2012's Cultural Olympiad and by coincidence it started at the same time that we held our first Sound Proof exhibition in 2008.

From the start, we wanted to keep the Sound Proof exhibition series as an independent initiative. Later, when I decided to continue Sound Proof on my own as a five-year series to represent the five Olympic rings, it was my goal that we could respond to the Olympic preparations organically. The sequence of yearly exhibitions would not be pre-planned into a programme of activities that fit an overall vision. Instead, it would commemorate the ever-shifting landscape of the Stratford site, perhaps in a search to represent what Paul Claval refers to as the "spatial patterning of social life and the symbolic imprint of social groups in the landscape".^[1] Sound Proof was an attempt to pin down in concrete, tangible terms the intangible memory of a site in transition.

The impetus for me was as well to maintain critical distance so as to achieve the even-handed perspective that I sought with this series. This approach echoed Nick Couldry's work on voice—creating "a sort of liminal space, alongside power but somehow normatively separate from it"[2] where the artists involved were encouraged to experiment and express their views freely. As Couldry states in an interview with Rafico Ruiz (published in the journal *Seachange*, 2012): "And I decided therefore to talk about voice as a value, which is the idea that not only do we have the potential for voice...we need to be in the middle of ways of organising things which value voice, which take voice into account." [3] Placing art as the main expression of that voice, Sound Proof fomented the idea of art as a social actor, expressing through its cycle of exhibitions John Dewey's understanding of communication as a medium for the sharing of meanings and his belief in the contribution of communication to democracy.

What became a series of yearly exhibitions of commissioned artworks with a focus on sound began in 2007 with a walk of the Stratford site of the 2012 Olympics. It was a tour of the site led by a member of the Ramblers Association who had recently moved out of the area to make way for the construction yet to come. He took us on paths, alongside the waterways, pointing out industrial and residential sites soon to be recommissioned for future works. It was like being in a space suspended in time; in a state of becoming. Not quite what it appeared to be, not yet the place envisioned.

Before each yearly exhibition, I would go on a walk of the site—in this way attempting to soak in the zeitgeist in the air that year, looking for visual signs of meaningful change in the landscape and observing the way the site integrated in its environs and how people interacted with it. Luckily for me, the Greenway—central artery cutting through the heart of the construction in Stratford—remained open to the public from the moment construction started, although for the first few years of construction, hardly anyone knew it and that made for site visits that were eerily quiet.

2. Distinguishing features of historical memory: Sound as cartography

Whoever maps the space gives that landscape and location its territorial characteristics: what is in, what is out, what is named, what goes unnamed or unmarked. It is a way to define the space via contour and specification.

When Colm Lally invited me to co-curate a sound art exhibition with him at E:vent Gallery in 2007, I had recently completed a walk of the designated Olympic area between Hackney Wick and Stratford in London. At the time of my walk I had wondered what would become of the space and whether any of its current landmark features would be retained. The memory of that experience stayed with me and helped shape the theme of sound as cartography for the first Sound Proof exhibition. Our aim was to capture sonic readings of the space at that time to retain a record of something that would disappear and re-shape into new forms when construction commenced.

We invited six commissions and asked the artists to create one-hour long sound pieces and visual maps based on artist's walks, with works by Brown Sierra, Angus Carlyle, Jem Finer, Sara Heitlinger and Franc Purg, Miller and McAfee Press (Andrew Miller and Duncan McAfee), and Vessna Perunovich in collaboration with Boja Vasic. This approach had as its model the rich history of artist walks by artists such as Janet Cardiff, Richard Long, Sophie Calle and Hamish Fulton.

At the time we were aware that official programmes were starting up and that our contribution would be considered within the bigger picture of the Cultural Olympiad, artistic programmes in London cultural centres, and other independent contributions from initiatives like ours. We made a decision to go ahead with an independent offering that would encourage different perspectives from the artists on the Olympic project and retain the focus on the artistic output. And so it is that Sound Proof crystallised as an idea and as a show. I retained that approach as I continued to develop Sound Proof as an exhibition series on my own.

The sequence of walks—organised and pre-planned for a curated exhibition—spoke implicitly about inside and outside space, inner and outer, both spatially and also in terms of the socio-political positioning of the project. This was the first exhibition, and as of yet, there were no others planned to follow it. So—in a way—out of all the exhibitions in the series, Sound Proof 1 was the most in-the-moment, the most authentic of the five. With nothing preceding it and nothing following, Sound Proof 1 expressed the sense of urgency at that time to memorialise a landscape that would be altered beyond recognition within a period of years. The six artists (and artist pairs) involved in the exhibition all seemed to recognise that we were part of a capturing of a moment in time, before the site inexorably pushed on to its Olympic destiny. In a way that period of a few months between January and April 2008—the time when the Sound Proof 1 commissioned artists were recording at the site—reminds me

of Lisa Saltzman's description of Pliny's tale about the Corinthian Maiden who drew an outline of her lover before he went off to war as "that mythic moment when imminent loss drives the impulse to record and remember"[4]. Saltzman's interest in the tale is "in its potentially paradigmatic status, the model it provides for isolating and interpreting the various visual techniques and technologies through which the work of memory is performed in contemporary artistic practice"[5] and "as a ritual of remembrance".[6] For Sound Proof, the techniques were sonic more than visual and so the discussion we extended was not just art's role in remembrance but also the loss of oral traditions as a means of commemorating and preserving our links to the past.

Oral traditions conveyed historical events and cultural narratives via direct imitation and observation and placed vernacular culture on the same (or greater) level of importance as official records.[7] This meant that history was passed down through direct contact, making the local interpretation of a space more important than the official one. With the development of the written word, distribution of culture, knowledge and history transferred from the local to the official having huge temporal and spatial consequences. Linking local narratives to those of distant places meant that perceived geographical and historical bonds could be cemented, making it possible to build great systems of power and political organisation. This led to the rise of nationhood as a concept encapsulating the social, historical and political characteristics of collective identities formerly differentiated through local affiliation.[8]

Sound Proof used sonic strategies to give a vernacular reading of the Stratford site at the same time that the official cultural programme was establishing its historic record. As a series of commissions the exhibition mobilised vernacular aesthetic inheritances to, as Saltzman says, make memory 'matter'. And so, the oral elements of the works give the past a place in the present.[9] Our approach stood alongside other initiatives to conserve elements of the cultural landscape being transformed. Two years after the first Sound Proof exhibition, Hackney Museum initiated an oral history archive of local residents and businesses, preserving their perceptions of the changes taking place during the build up to London 2012. The project was called Mapping the Change and invited initiatives like Sound Proof to be part of the archive of works. In this way Mapping the Change amassed a comprehensive local record of cultural activity that is preserved for public use at the museum and forms part of the official record. This type of approach mirrors work in the field of landscape studies, where place meaning is enacted through both vernacular and official channels, considering local populations and visitors as much as the functional category ascribed to the site officially.[10]

As Claval states with great urgency: "The contemporary crisis of identities is responsible for the renewed interest in landscapes by geographers, and indeed for the spatial turn generally across the social sciences." He reinforces a belief in the importance of place in identity formation stressing "the complex relations which exist between social groups and spatial forms".[11] Niamh Moore more specifically zeroes in on the role of the city in identity formation, noting that cities that rely on change to survive will confer a more fluid and dynamic place identity upon its inhabitants.[12] London being a prime example of this, the Stratford site's designation as Olympic made it particularly vulnerable to 'forgetting'—the idea that a new identity could be imprinted on it—and so it is that a surge of localised projects emerged during the key period of 2007-2008 as a means of offsetting what was going to be the 'imminent loss' that Saltzman speaks of in relation to Pliny's Corinthian Maiden. The brownfield land between Hackney Wick and Stratford fit Moore's description of a landscape that is 'particularly unique, legible and imageable within a particular city' [13], making it a prime site of contestation during the huge surge of economic and physical restructuring in the area after London was announced as Olympic Host City post 2005.

Anthony Giddens also cautions against seeing cities simply as 'blank canvases' to be filled with new narratives and emphasises the intimate links to the past that remain and should be conserved as part of their spatial identity. Going further still, he stresses that spatial cultural memory is preserved by the inhabitants and visitors most closely and strongly associated with it. By extension, he also highlights that the loss of those specific members to the local landscape signifies a cultural loss as well, unless something is done to preserve their memories and their contributions to space creation. Giddens sums it up by stating: "In a world characterised as runaway and constantly in flux, memory is critical in the formation of both personal and place identity but it is also crucial in shaping discourses on preservation, development, and how heritage is defined and represented." [14]

Giddens conceptualises globalisation as, not only pulling upwards (from national economies), but also—and importantly—pushing downwards, having direct influence on local decision-making. As national governments increasingly lose autonomy in the face of international competition and demands, they put increasing pressure on their landmark cities to provide a sense of national pride and a sense of

Fig. 1: Stratford site, London. 2008.

heritage. Thus the current fierce competition for Olympic status and the heritage rewards it promises. For nations caught in the middle of what Giddens describes as problems both too large and too small for nations to solve, Olympic status can help reinforce national pride—something precious and difficult to summon in the face of a highly interconnected and interdependent global economy.[15]

Economic restructuring has impacted on urban planning on a global scale, leading to an entrepreneurial approach towards heritage that often leaves those for whom the memory of a place remains the strongest feeling the most out of place.[16] This creates direct conflict between the idea of heritage as a shared public resource and the construct of heritage to reinvigorate urban areas.[17] It puts in danger the ability of the cityscape to operate as 'psychic anchor' for its inhabitants and visitors, and it undermines the ability of its spatial framework to provide a sense of history from which to embrace the shifts and changes of time.[18]

Certainly there was a 'psychic anchoring' taking place through the sound commission recordings for Sound Proof 1—something historic in a vernacular way as artists explored and documented the space before traces of its existing essence would be dug out into piles of dirt. Jem Finer's performance at the Stratford site in the depths of winter provided for me that 'mythic moment' that Saltzman references. He invited me to come along for his performance at the site in early February 2008 and the first thing that struck me was the massive blue wall that had been erected since my last visit in 2007. It surrounded the entire area, with the distinctive blue paint used to mark out even bridges and access points, announcing the site's state of becoming Olympic. I had not known about it and was totally unprepared for it. It was truly an incredible sight. Within a period of a few months, the landscape had been transformed from overgrown weeds and decrepit buildings alongside working factories and living accommodations (designated as brownfield land) to a cordoned off area surrounded by fencing and wire mesh, all painted in a memorable blue. Just as Yves had his International Klein Blue, so London 2012 had its blue to designate the area as Olympic. It was to that panorama that Finer introduced a troupe of musicians to trumpet down the wall. They played along paths leading to the wall, marched alongside it, and reached the midpoint of the Greenway—the public pathway that acted as central artery to the epicentre of the construction. Workers at the site waved and cheered as the musicians performed their finale facing the wall.

Pliny's Corinthian Maiden tracing the contours of her lover's shadow became for the artists in Sound Proof 1, the tracing of the contours of the perimeter of the Stratford site. We had asked for permission to do recordings inside the site, but were instead granted a bus tour of the site with no stops, no access to the outside, and no recordings allowed during the journey. Having had the experience of travelling inside the site, but then only being able to document its perimeter—now cordoned off by an imposing blue wall—the artists were of course positioned on the outside looking in; or drawing the contour of the shadowy world that the construction site became after the wall was erected.

3. Distinguishing features of historical memory: Sound as artefact

"History studies the past through old documents, and in the case of landscape, is essentially a documentary study of maps and documents related to landscape. Archaeology studies the past more directly, through material remains in the present." [19]

For Sound Proof 2, the theme was sound as archaeology, with an emphasis on the artefact—reflecting the key question for me in 2009: what could constitute material fact for a site in a state of becoming? I commissioned four artists—Isha Bøhling, Daniel Jackson, Sheena Macrae, and John Wynne—to create object-based installations with sound for the exhibition. Brian Reed and I produced a vinyl record multiple in an edition of 300 for Sound Proof 2—the record being a sound artefact from previous decades as few would have turntables to actually hear the sound recordings on the multiple.

In a departure from the first exhibition, my main curatorial direction for this exhibition was to allow sound works to co-exist in one space with all works playing simultaneously (no headphone works)—allowing the sound elements to breathe and interplay with each other. Like the previous year, I invited artists to explore around and through the Olympic site to gather materials and inspiration for their commissions. I expected a range of responses and these would form part of the Sound Proof record—like a yearly litmus test reading.

In a site still in development, what would constitute artefact?

For John Wynne and Daniel Jackson, the artefact in 2009 was extracted, not from the physical site, but from public consciousness. John Wynne investigated meaning in the visual form of the Olympic logo and through that uncovered an alternate reading to that supported in the popular media. Subversions of the Olympic symbol manifested in graffiti, stickers, banners and blogs. Legislation enacted to bottle up voices of protest. Battles waged for right of use and ownership of lands. As Wynne stated, "the starting point for this piece is visual rather than sonic", and through that approach he created a sound work that built a sense of expectation and anticipation, much like the projection of the five rings onto collective consciousness. For Daniel Jackson's conceptual sound work, the physical site existed in terms of its statistical data and numerical reference points. The bone structure—invisible but holding the whole project together—was the physical site in Stratford. The visual manifestation was a play on the word represented through the five rings—olympics.

For Isha Bøhling and Sheena Macrae the archaeology was personal. In 'Prize', Isha Bøhling excavated a family history to evoke both the historic and individual sense of loss that accompanies an Olympic competition. Sheena Macrae had a personal history sited at the centre of the future Olympics complex, as she lived in the Pudding Mill Lane area for some years. Working with composer Paul Robinson, Macrae examined her personal sonic signposts—like ruins from a former time—by compressing and intertwining sequences from Robinson's compositions to convey a folding over, multiplying and layering of time and change in her own personal narrative. As she stated at the time, "soon my studio will be floating somewhere above seat 64 in the stadium".

There was a real, physical site in existence in 2009 in Stratford, London—one populated by bulldozers, cranes, metal, trucks, and a lot of dirt. It was a transitory space, waiting to be filled and completed by an event yet to take place. The search for material fact at that point took place in our minds—through our understanding of what came before the site was designated Olympic and in our ability to foresee what was yet to come.

4. Distinguishing features of historical memory: Sound as text

Returning to the site in early 2010, there were developments on the way—cranes dotting the skyline, stadium structure dominating the epicentre of the site, signage designating the space Olympic, and a cafe, exhibition space and viewing area to make the works in progress accessible to the public. With the site's identity emerging, it seemed an appropriate time to open up the conversation and involve other sites around England also involved in Olympic competition.

Sound Proof 3 became a dialogue between two sites of the future Olympics: Weymouth and Portland in Dorset—where the sailing was to take place—and Stratford, London. I co-curated the exhibition with Julie Penfold (LabCulture, Dorset) and we selected two artists based in London and two based in Dorset to create responses from their own site-specific perspective: Claire Burke and Joe Stevens from Dorset and Sheena Calvert and Denna Jones from London.

The theme for Sound Proof 3 was sound as text: the vernacular (phonetic) represented in its textual form (written). We linked the artists and sites via the means of conversation, starting the project in

Fig. 2: *Overtime* installation. Barbara Held, Yapci Ramos et al. Sound Proof 4. Canterbury Court, London. 2011.

September 2010 as part of the B-side Multimedia Arts Festival in Dorset. One of the key texts that emerged from Sound Proof 3 was Sheena Calvert's visual deconstruction of Iain Sinclair's conceptualisation of the term 'edgeland'. Through formal compositions on the two-dimensional plane, Calvert explored the liminal spaces of paper "which elude exact definition, yet which are constantly being [in]formed"[20]—the edges and folds of paper as key conveyors of information. For Claire Burke, the focus was on written text's ability to align itself more closely with its phonetic, vernacular form: "Open breath open view open sea. Open ears open eyes open future. The ground: open. Open past open heart open masts open art. Open window open web open world." [21]

5. Distinguishing features of historical memory: sound as legacy

One year before London 2012, Sound Proof amplified its reach and extended the dialogue to Barcelona, site of the Olympics in 1992. I wanted to explore the potential links between the two cities, as—with a 20 year difference—there was an interesting reflection on Olympic and artistic legacy that could take place.

In preparation for the Sound Proof 4 exhibition, I did a residency at the Barcelona Museum of Contemporary Art (MACBA) at their Study Center in early 2011 and accessed documentation, exploring both the historical references to the 1992 Cultural Olympiad and the urban legacy the Games imprinted on the city. My work also involved exploring the sites of the 1992 Olympics with a special focus on the Poblenou area, earmarked as a key area of regeneration for Barcelona 1992. What of Poblenou now and its Olympic legacy?

The 1992 Games once again reconnected Barcelona to the sea as the old industrial area of Poble Nou—flanked on the seafront by railroad tracks and populated by factories no longer in use—was renovated as part of the plan to site the Olympic Village there. As Lluís Millet explains in *Barcelona: La ciutat i el 92*, the renovation had as one of its main objectives to transform the area of Poblenou from its obsolete industrial use to one more urban and residential, with the aim being to recover the entire line of the sea from Barceloneta to the Bèsos river as an integral part of the city.[22] In fact, the handling of Poble Nou and of the Stratford site are quite similar in terms of the problematic they

presented and the aspirations attached to both sites. Both areas were considered marginalised from the city in some form, with considerable areas of brownfield designation, limited transport links and low residential use. Both landscapes had industrial function imprinted on them, much of it no longer in use. Both had a low profile in terms of image, which meant they could be reshaped and reformed as new areas post Olympics.

After consulting the written texts providing historical references of Poblenou, I embarked on a series of site visits, including a walk from the north centre of the city to its northeast edge, cutting through the heart of neighbourhood. From what I had read from a distance, Poblenou was an artistic hub poised to transform into a centre of technology. My walks did evidence areas of transformation and development and areas that still needed work—at least from the residents' perspective.

On the recommendation of Pilar Ortega of the Miró Foundation in Palma de Mallorca, I began by accessing documentation of Glòria Moure's commissions for the 1992 Olympics. The commissions are a fixture of the city to this day, with Rebecca Horn's installation at the beach in Barceloneta a key landmark of that area, although few people would recognise it as an emblem of Barcelona's Olympic legacy. This became a very interesting point for me in relation to the approach I wanted to develop for Sound Proof 4—to expand on Moure's idea that the commissions did not have to make specific reference to the Olympics.

In his discussion on the framing of heritage Paul Claval distinguishes between vernacular and official forms of establishing cultural allegiance through ties to the past. The vernacular form meant that a sense of continuity between past, present and future was established from local environments and transmitted by its inhabitants, conferring the power of heritage transmission to local populations rather than relying on official interpretations. Any historical reference beyond the lifespan of living inhabitants could be relegated to the area of myth, so that a person's sense of identity and their sense of place "was directly experienced as a living reality".[23] With the arrival of the written word, cultural elements could be transferred to younger generations beyond the memory of living inhabitants and could be linked to other geographical locations beyond the experienced landscape. This allowed for the expansion and transmission of knowledge and experience across time and space, but it also made it possible to harness a sense of heritage and belonging into more centralised power structures.

This distinction between vernacular and official heritage transmission is directly relevant to an understanding of the Sound Proof series of exhibitions in relation to the official Cultural Olympiad. It is not a question of better or worse, but of adding texture and understanding to cultural activities happening in relation to London 2012. What Sound Proof sought to establish was a platform for independent voices from the artistic community—organised in a more ad hoc framework to allow for reaction in time and in space to events happening within the city in preparation for the Olympics. It was not a case of us vs. them, but an opportunity to showcase the importance of the vernacular in bringing into focus what might be lost in the official.

The core activator for me in the construction of both Sound Proof 3 and Sound Proof 4 was the mechanism of the conversation. In the case of Sound Proof 3 the conversation between artists happened through the Twitter mechanism. In Sound Proof 4 the conversation happened at the exhibition space, with all four installations co-existing in one large warehouse space—ambient sounds intermingling freely. Expanding on the approach of Sound Proof 3, I invited two commissions from Barcelona and two from London to create a conversation between works by the artists from the two cities. Exhibited in Canterbury Court in November 2011—site of Sound Proof 2 in 2009—the installations of Sound Proof 4 formed a type of environmental sculpture, projecting the voices and thinking of the participating artists and allowing the works to speak to each other in the context of the exhibition.

Leigh Clarke's commission for Sound Proof 4 entitled *Squash*—a celebration of his passion for art and his frustration with sport—expressed a view that might not be so easy to posit through official channels, yet expressed what many in the population felt. John Fawcett exhibited *Radiance*—a filmic document of the creation of a huge energy network throughout London. Roc Jiménez de Cisneros' *Continuum, expanded* was an unstated commentary on the use of cultural activity to support official versions of legacy and heritage—the lack of statement being central to the work. Barbara Held's collaborative *Overtime* was a real time transmission of a memory held from the Olympics in Barcelona 20 years earlier—allowing for new interpretations and various iterations through five different expressions of one score. This was the most truly vernacular of all the works presented during Sound Proof 4, as one of the responses to the score was created during a live transmission on Resonance FM days after the exhibition opened. The links celebrated in *Overtime* were not between individual and

nation, as is often the case in Olympic events, but between individuals who had a shared history and set of interests—people who knew each other personally and celebrated together a moment in time.

Perhaps it is the case that the experienced has lost its currency. Through digitised global interactions with others, we have come to rely less and less on what we know and experience in our immediate environs. As Giddens puts it, "When the image of Nelson Mandela is more familiar to us than the face of our next door neighbour, something has changed in the nature of our everyday experience." [24] It comes back to an art of observation and to being in the moment and experiencing it as a time and a space. This is becoming increasingly difficult to do as our every experience has the potential to be networked, indexed and distributed as it is being felt and experienced, with the emphasis being more on passing it on and less on the experience itself.

This need to index and punctuate through historical links is what Giddens emphasises when he writes "It is a myth to think of traditions as impervious to change. Traditions evolve over time, but also can be quite suddenly altered or transformed. If I can put it this way, they are invented and reinvented." [25] For him the transition from tradition to heritage marks a disconnect between the experienced event and its shell rituals, leading towards a celebration of ceremony. This is quite effective in the transmission of power structures to a society's population, but it is the shared experience of the tradition that links individuals to their sense of time and place, and this—Giddens asserts—is most fruitfully accomplished via democratic structures and processes that require direct participation from individuals in the population in order to activate the mechanisms of power.

6. Distinguishing features of historical memory: Sound as voice

In her study of urban heritage, Moore expresses the critical role that memory plays in both personal and place identity and how this plays out in the repositioning of areas marked for regeneration —'landscapes that are particularly unique, legible and imageable'. This was certainly the case when the Stratford site was announced as main site of London 2012. By the time the first Sound Proof exhibition was in the planning stages, there were projects taking place to debate the actual costs and benefits to the communities affected by the transformation of the area. Many of these debates focused on displacement of well-established communities for the sake of monetary gain by outside forces. And so it was fitting that for the fifth and final Sound Proof exhibition (which took place during London 2012) we invited the We Sell Boxes We Buy Gold collective to present their archive of interviews, photographs and sound works produced five years earlier, at the time that our own exhibition series coincidentally started.

We Sell Boxes We Buy Gold—a project initiated by Lucia Farinati, Richard Crow, Alberto Duman, Jude Rosen, and Louise Garrett—had examined the social, physical and psychological implications of the Olympic project in the areas within and surrounding the designated area through a series of artist walks that also represent "that mythic moment" that Saltzman references in relation to Pliny's Corinthian Maiden. The archive of interviews, recordings, and photographs produced in 2008 was exhibited for the first time at Carter Presents Gallery in 2012 as part of Sound Proof 5, bringing the Sound Proof project full circle from beginning to end.

A force once seen mainly for the good, regeneration has now shown its many faces and has demonstrated the complex effects it has on the vibrancy of the communities undergoing the changes. I touch on regeneration in this paper quite lightly as it was not the main concern of the exhibition series. But for those artists involved in Sound Proof not buoyed by the Olympic spirit, regeneration concerns were central to their critique, in particular Jem Finer (SP1), John Wynne (SP2), Sheena Calvert (SP3), Leigh Clarke (SP4), and We Sell Boxes We Buy Gold (SP5). It comes back to the point made by Moore about heritage as cultural resource or as financial asset. [26] It is in the spirit of heritage as cultural resource that Sound Proof engaged in a more ad hoc and organic manner with a site and an event punctuated by official quotation marks, allowing more vernacular forms and expressions to represent the event as cultural artefact.

Sound Proof 5 also showcased the work of Jonathan Munro who looked beyond the immediate area of the host city and featured responses to the international event by children living in the city of Hull—a location in the north of England not touched by Olympic gold dust but seriously affected by the economic turmoil of recent years. Their hopes for the future on the eve of London 2012—in spite of the complicated backdrop of their immediate communities—lined up quite well with their nation's wider ambitions for the Olympic project.

In the work of Marcus Leadley, the idea of within and without was expressed through a focus on sound art. His breaking apart of inside/outside acoustic aspects of diverse environments fractured the

Fig. 3: *Outside In* installation. Marcus Leadley. Sound Proof 5. Carter Presents Gallery, London. 2012.

everyday experience into its constituent parts. The result was a disorienting interplay between what is seen and what is heard to arrive at a clearer understanding of sound's pervasive relationship to a complex network of personal experiences and associations that colours our experience of place.

Through the experienced installation, Leadley achieved an integration between vernacular and official form intermingling sound with visual and sensed environment. In this work he spoke about inside and outside space, much as the Sound Proof 1 artists had done five years back. Whereas for the artists in Sound Proof 1 there was a sense of imminent loss, Leadley's installation is full of open interpretation and possibility—a porous liminal space that allows for the crossing of unspoken boundaries in time and space—at that key juncture in time when London 2012 was taking place. The past and the future were not the focus for once, just the present.

7. Conclusion

In his exploration of an evolving conception of heritage, Claval finds "new values and meanings are now being ascribed to particular landscapes, many of which previously were not considered of particular significance." [27] This is one of the elements linked to the regeneration efforts of Olympic cities and London responded to this in a knowing multi-layered, multi-faceted approach, by building opportunities for vernacular responses within the aegis of the official programme and through the many initiatives by cultural centres in the city. Sound Proof, in its yearly iterations, became a memory track of how the Stratford site was building up towards 2012, reflecting a complex layering of moods and views through the filter of artistic responses. This ad hoc, organic approach allowed for multiple voices to contribute to the cultural legacy of London 2012, celebrating the values and meanings of the location through vernacular forms and channels.

The rural landscape in Campania. The role of the graphic representation in the documentation and valorization process

Stefano CHIARENZA

Department of Civil, Construction and Environmental Engineering, University of Naples "Federico II", Naples, Italy

E-mail: stefano.chiarenza@unina.it

Abstract

The rural landscapes, as a result of action and interaction of anthropic and natural factors, constituting an essential component of the common cultural and natural heritage, are the identity foundation of a site. They have been often investigated in terms of their historical and civil value, as well as economic and social dimension, but they're also a visible sign of landscape shaping by human activities. In that sense the scenic value of the agricultural landscapes is increasingly seen as an element to be preserved, as evidenced by the closer attention in the current European policies to protect, manage and plan agri-ecosystem resources, biodiversity and traditional elements of landscape.

The research proposed in the present paper, based on the latest studies in that field and recent European experience of landscape assessment, try to highlight the possibilities offered by the graphic representation in the process of knowledge and documentation of this particular heritage, focusing on a series of demonstrative applications on a valuable agricultural landscape such as that of Campania. From the interpretation of historical maps to the realization of infographic models and mapping, will be proposed cataloging hypothesis of some exemplar agricultural landscapes.

Keywords: representation, rural landscape, mapping, infographic models, ichonography

1. The importance of the rural landscape in the cultural identity of a site

The agricultural landscape, or «the form that man, in the course and for the ends of its agricultural productive activities, consciously and systematically impresses on the natural landscape» [1] reflects the age-old human interaction with the environment. In its blend of natural and anthropogenic component it is characterized by a strong cultural identity represented not only by the material elements related to its structure, but also by his essence of artifact. Indeed the agricultural landscape collects a set of meanings and values that on the one hand are associated with the physical morphology of the territory; on the other, heavily depend on the forms impressed on it by the human activity. The social, political and settlement dynamics frequently have led to significant changes, leaving indelible marks on landscape.

The rural landscape is therefore a living and dynamic construction, always in progress, and, as expression of cultural values and intangible traits, should be considered a significant component of the cultural heritage. In other words, it must be read as an organism made up of different characters, temporally distinct, though irregularly stratified, and not as a pure synthesis of visible items. In fact, as diachronic structure, does not lend itself to interpretations based on its apparent organization: such readings, linked to a specific time and to a particular socio-economic or functional aspect, would remain abstracted from its evolution over time.

As stratification of the modifications the rural landscape thus assumes a fundamental role and an active part in the society and the economy. By its articulated beauty, that is the result of adaptations built up over thousands of years, it represents an unparalleled sign of identity. At the same time, offering itself as a field for the development of more diversified cultivation techniques, it becomes a valuable economic resource, but also cultural and environmental. These considerations let us identify the rural landscapes as real cultural landscapes, «combined works of nature and man» (UNESCO

1972) through which it is possible to understand the evolution of human society over time and the ability to adapt according to the influence of the physical constraints and the opportunities provided by the natural, social, economic and cultural forces.

In this sense, it should be noted, the landscape takes on the character of rational structure which expands the meaning of sensitive geographical landscape, contemplating articulated relationships with human settlement structures, rural society and the agricultural economy. Humanized landscapes characterized by «complex combination of objects and phenomena related to each other by mutual functional relationships so as to constitute an organic unity»[2].

The growing interest in Europe for rural landscapes shows the importance that they are acquiring not only in terms of aesthetics, but also as fundamental resources in the definition of territorial development models. Hence the need to safeguard the incipient threat of exploitation linked to unsustainable farming practices or erosion associated with rapid changes in socio-economic or inappropriate policies that determine the neglect and the gradual abandonment.

In this direction, since several years, seem to be moving European policies for the protection of agricultural contexts – with the enactment of measures of biodiversity management and conservation of typical elements – as well as numerous studies aimed at identifying and classifying historical landscapes.

There are also many Italian research aimed at the definition of inventories of rural landscapes throughout the country, in order to establish an effective management tool as part of the same agricultural policies.

On the basis of the importance of rural landscapes in defining cultural identity of places [3], this research focuses on traditional agricultural landscapes in Campania, analyzing the evolution of the landscape, examined from the point of view of its forms rather than on its ecological and naturalistic aspects or its scenic values. Through the analysis of case studies, this research thus opens up new possibilities for documentation of rural landscapes through the graphical representation, taking into account the ways in which historically they have been represented (often in an indirect way) and the new possibilities of representation in the process of documentation and enhancement.

2. The agricultural landscape in Campania: historical developments and elements of identity

The richness and variety of Campania territory offer to the study a unique combination of natural diversity and a great number of processes originating from an intense history of different cultures. So, with regard to the reading of the historical evolution, from the point of view of landscape representation, it constitutes a particularly significant case. The historical interpretation of the complex phenomenology existing in the territory makes it possible to trace the matrices of the current organizational structure of agricultural landscapes, marked, of course, in addition to the natural topography and climate variability, even by a strong stratification of the signs that many civilizations have marked in over the centuries.

In this direction, it is possible to highlight an historical synthesis of the landscape developments, structured on a narrative that individuals and colleagues a series of significant moments throughout the history of the region.

The concept of agricultural landscape is related to the conscious and systematic transformations of the natural environment, so that the oldest outlines in Campania are put in relation to the development of permanent cultivation, by the cultures of indigenous peoples in the area. However, considering that the framework of the evolutionary development of these civilizations isn't well-defined, it is not possible to infer, beyond theoretical considerations stereotypes, which were the structures related to the landscape.

A decisive role, however, had the first Greek colonization which traced the first tangible forms of agricultural landscape. The impact on the environment of different and consolidated socio-political and religious organizations, together with the development of new agricultural techniques, suggest the definition of well-defined paths whose signs, on a par with those of their urban conformations, may still be traceable.

The region, then as now, was divided by Mount Somma-Vesuvius in two parts, connected by the vast plain of Nola. To the north, the rivers Volturno and Clanio flow through the plains around Capua; to the south, there's the Valley of the Sarno, which opens to the gulf; the Phlegraean area, with the island of Ischia, and the Apennine mountain spine of the Sorrentine Peninsula, with the island of Capri, conclude the *sinus Cumanus*. All these places had the characteristic of being well protected and extraordinarily fertile soils rich. The city of Cuma, Naples, Posidonia, are exemplary expressions of Greek culture in Campania. The colonial cities that were settled enjoyed large areas of arable land that were planned in a manner closely related to the organization of geometric urban tracks. The *strigae*, parcels of land long and narrow that were distributed to settlers for farming, are still readable in the plans of Naples and Posidonia. In the principles of the Hippodamian system, the urban area and the countryside were closely related to each other, in a chessboard in which the areas were divided according to a functional distinction between residential areas and public or agricultural use areas. Such kind of planning influenced and characterized the agricultural landscape unequivocally. But to contribute greatly to its forms, as well as the influence of geographical, were the development of new

criteria for allocation of land in relation to the categories of the owners [4], classification of land and crops [5] and at the same time the use of agricultural systems such as crop rotation. However, beside a rural landscape that is stated in regular geometric shapes as clear expression of the will of planning, it is possible to find random and arbitrary elements, result of individual improvisation. In particular, in areas near the sea, on lands in slope or near the villages, you will have a natural mosaic of land plots, often enclosed by stone walls to save them from the pastures, which determine the shape of the typical 'Mediterranean garden' featuring cultivation of grapevines or olive trees.

Better defined appear the signs of Roman culture on which we can find certainly elements of the Etruscan, Italic and Greek culture. The main economic activity of the oldest Roman civilization was primarily agricultural and pastoral. When the expansion of Rome spread throughout Campania (IV-III century BC.) the agricultural landscape bent to a real plan of colonization. The conquered lands were the subject of a careful planning as well as of new legal relations. It was created the *limitatio* – the division of land through *limites* – or the *centuriatio*, – that is, the division in *centuriae* – particularly used in the colonies where the land was assigned and thus formed groups of small landowners. It is in this type of organization that expresses new forms of social aggregation. In Campania, however, there is the prevalence of slave estates, less cohesive and not always able to provide an organic relationship between town and country. The forms of the Roman agricultural landscape are therefore dominated by strict rules of division and distribution. On part of the territory are still visible the remains of Roman centuriation and in some areas have preserved the use of roads and trails, where most, correspond to the *limites* of the ancient *centuriatio*. Such structures, together with the creation of an organic plan of roads and a hydraulic system of soil, are evidence of what was once an effective control of the physical space that allowed the Roman agricultural and administrative system, a widespread.

Fig. 1: On the left: A. Leone, *De Nola opusculum*, 1514. On the right: G.A. Rizzi Zannoni, *Carta Geografica della Sicilia prima*, 1771 (a detail of Campania)

Since the second century, the vast estate or the villa are replacing the enclosed fields – cultivated by families that excluded their mixed use; the slave labor is substituting the free farmer, and the specialized crops of the vineyard and the olive are replacing the crops of cereals, imported more cheaply from the provinces. These crops are very different from the shape of the small family plot and take the form of plantations. It's taking shape the organization of the *villa rustica*, a large farm of industrial crops [1], which brings together, in an ideal closed system, even the garden. The villa is emerging as a place of pleasure, idleness and refinement. *Utilitas* and *venustas* are lumping in agriculture and this gives rise to forms aesthetically significant. Evidence of the *villae rusticae* are scattered on the northern slopes of Mount Vesuvius, on those mountains Lattari (at Gragnano and Castellammare) near Scafati and near the present Boscoreale. Intensive cultivations of vineyards and shrubby become an integral part of the agricultural landscape. But the fertility of the soil also favored crops of wheat, spelled and legumes often sown among rows of vines and olive trees, in order to get better returns. Typical, in flat fields, was also the planting of the vineyard joined to the poplars or elms, due to the need to keep the grapes away from the swampy or wet ground. There are numerous testimonies of planted olive trees that formed a dense cover of soil especially in the region around Gragnano. The agriculture in the plain of the Sarno also had large importance: here small and large estates proliferated fragmenting the soil in plots fairly regular. But the garden of Italy was the plain near Capua where agriculture was the main occupation at all times, especially for production of cereals. It is from this time that structures of large farms are disintegrating itself to the benefit of the pasture and the redefinition of small farms. From the fifth century the agriculture starts instead towards forms that characterize the autarkic medieval landscape. During the Middle Ages in Campania we are witnessing to a landscaping configuration different than other parts of Italy and Europe where the feudal economic structure gave rise to a model based on an agricultural production centralized on small lots around large properties, and wide areas were left instead to erosion and neglect. The so-called *curtes* in Campania there were ever. The agrarian structure, although based on the owner's residence, is more similar to large

estates and to the Roman villa. More precisely, both in coastal areas than inland, the settlement structures adopted were two: those of the open villages, consisting of a series of plots (called *mansì*) enclosed by hedges or low dry-stone walls, in each of which there was a small farmhouse; and those of *curtes* or houses, consisting of a central core made from a set of buildings bounded by a fence. Inside the *curtes* there were the owners' houses, huts for slaves and then barns warehouses, mills, stables. Nearby there was often the vegetable garden, the mill and a small garden.

From the sixth century the process of rural exodus leads to the formation of *castra*, concentrations of inhabitants that were closed for security reasons, often located in the hills within protective walls and close to a seigniorial castle. Many lands are abandoned, becoming places of nomadic pastoralism or poor crops. The flatter areas or that one near the coast undergo phenomena of waterlogging. We can find the forms of an organized agricultural landscape now near the cities, merged into a homogeneous structure with the built.

Between the tenth and twelfth centuries there is a political prevalence of the countryside. In this period lordships develop around castles that are settled in the place of old Byzantine or Longobards forts or instead of old *villae* variously scattered throughout the region. But even more than the castles, to give shape to spatial planning were the prevailing religious foundations – in particular Benedictine – that, in an attempt to repopulate and tilling the countryside, conceded spaces on which to cultivate and graze giving rise to the formation of open towns and hamlets. The entire side of the Amalfi Coast and the Valley of Cava de' Tirreni begin to become a place of settlement thanks to religious organizations that attract groups of farmers from surrounding areas, with donations concession on agricultural land parcels. Similar dynamics also occur in the Cilento where non-religious associations are receiving concessions by the public authority to use large plots of land on which are build several farmhouses. The soils are generally divided into small plots which ill accorded with specialized crops rather than food self-sufficiency. However, in the Amalfi Coast, many areas are destined to specialized crops and this is due – at least in part – to the presence of extensive trade with distant lands. So if in the beginning of twelfth century there is a prevalence of the vineyard at the end of it there will be instead prevalence of chestnut and of the more valuable crops of citrus and rose gardens. The fields are populated by different varieties of trees which correspond to an entirely new land improvement: terracing, drainage, retaining walls etc. The introduction of the cultivation of citrus fruits and the use of irrigation systems of Arab origin will lead these places to define an agricultural landscape distinctive and lasting for centuries.

Fig. 2: Three types of agricultural land arrangement. From the *Enciclopedia Agraria italiana*, 1882

In the Middle Ages, the Norman politics first and the Swabian then constitute one of the main elements of differentiation of the agricultural landscape of southern Italy. Indeed, while the birth of Municipalities brings in the north of the peninsula to the affirmation of new landscape structures, in Campania, as in the whole south of Italy, the landscape is still influenced by authoritarian political attitudes. Nevertheless, the trade policy of Frederico II gave to the agricultural economy of Campania an imprint of colonial type promoting both businesses and agriculture. It was in fact favored the creation of farms (*regiae masseriae*) who had the task of developing the crops that fed the major currents of traffic. The fields are covered with grain, chestnut groves and vineyards, all products that attracted the most foreign markets. Consequently, the landscape, especially on the Amalfi Coast and in Irpinia changes considerably as a result of the production choices of the great lordship. With Anjou in Campania was set up an archaic and backward feudalism that damaged the agricultural economy and consequently the shape of the landscape that was characterized by an enlargement of fields to grass for grazing and the increasing of deforested areas. The changes of the landscape are then marked by a general impoverishment of the countryside but an increase in peri-urban agricultural areas, armed with new hydraulic works and roads. Many terraces are created, in Naples, on the slopes of the hills areas and orchards and gardens pertaining to the religious structures spread, giving, this time, a new and more luxuriant appearance to the urban landscape.

But the forms of the agricultural landscape are convoluted for a few more centuries. The state of agriculture, especially in the great plains of Sarno and Sele was to appear, still in the fifteenth century, rather primitive. The waterlogging needed costly land reclamation works, arrangements and ductwork that the landlords refused to deal with. The more characterized forms of the landscape were in the hilly areas, where concentrated the works of clearing and arrangement. But the irregular morphology of the Campania hills did not favor rational and geometric processing of funds so that the landscape seemed marked by distributions of crops (mainly olive and fruit trees) according to irregular and sinuous lines that are often adapted to the shape of the ground. On the mountain reliefs there are instead woodlands constantly eroded by the works of deforestation. The practice of farming in the sixteenth century led to the determination of vast fenced areas mixed to cultivated fields. This characteristic had to give a new image of the landscape. These forms, however, were destined to a fast degeneration linked to the constant increase in the pastures at the expense of crops. Articulated political, economic and commercial dynamics led in the '600 to a general decline of the agriculture in Campania. This decline will determine the inferiority of southern agriculture in the centuries to follow. The rural landscapes present significant forms only in the suburban areas where the Mediterranean garden and the farms spread like typical shapes, result of the individual initiative of the middle class members, urban or rural, or of the feudal lords and clergy.

During the last decades of the seventeenth and early eighteenth century can be glimpsed in the agricultural landscape some signs of renewal. Despite the strong conditioning of the feudal order marked signs of innovation in agriculture are introduced with the importation of new species of plants that enrich the flora and crops. Appear in fact the potato, maize, tomato, tobacco, sweet orange and tangerine as well, including ornamental plants, agaves, prickly pear, eucalyptus. But the development of new landscape forms occurs only later, towards the end of the eighteenth century with the transformations of cropping systems, capital investment in rural areas and the development of farms mansions. With the Napoleonic laws that subvert the feudal system begins a new chapter in the rural history of Campania. Much of the countryside was marked by the installation of tree plantations on which the olive tree ruled unopposed among all [6] and reshaped the original structure of the Mediterranean maquis, often accompanied by restructuring operations of the landscape. The olive tree, widely used in the Salerno area and tuffaceous terraces of the Sorrentine Peninsula and more narrowly in the middle valley of the Volturno, gave a new aspect to all the countryside. In the same historical period also the citrus tree cultivation proliferates greatly than in the past and this also because of its exchange value. The places where this tree is concentrated are those of the Sorrentine Peninsula and the Amalfi Coast (where several terraces of citrus still persist), the Agro Nocerino, the Sele plain, and the Phlegraean area and the plain lands between Caserta and Maddaloni. The Mediterranean garden loses its variety and its symbolic and ornamental characteristics and, conforming to the most obvious economic purposes, has intensive plantations.

Even the gardens of vegetables, legumes and fruit trees begin to assume major importance in the nineteenth century, proliferating around the perimeters of the cities where it now is possible to see a dense network of family gardens. The inclusion of agriculture in the great circuit of the market will dictate the logic of the profound changes of landscapes with forms that are increasingly and inseparably linked with the economic and political factors that always have influenced their developments.

Fig. 3: Cassiano da Silva, a view of Amalfi, 1695-1705

3. The role of representation in the documentation and enhancement process

The comprehension of the landscape forms' evolution can not be separated from the visual interpretation of the shape that they presently take, or that over time have taken [7].

Although the studies based on the written documentation or on the descriptions have a significant value in the reconstruction of rural areas, it is not possible, purely on the basis of these sources, to

imagine the visual appearance of the various elements that compose it. Along with fixed and objective data, like those more strictly geographical, there is a class of non-static elements, but characterized by mutability's phenomena, including – as is evident – are also those introduced by man. And it is not only question of sizes and positions, but also of functional relationships. In this sense, the use of images is essential to understand the landscape's structure, like what happens with the architecture. No architectural history is possible without the use of the object's visual definition – whether it is performed through finds or images. No history of the landscape is significant without a tangible reading of the space's conformation. The history of the agrarian economy and aggregation's policies are, the only an aid, essential but not exhaustive, as well as political-social events support the history of architecture, making people understand some formal evolutions.

Then, the iconographic representations become essential items of study. In them, often in an indirect way, are found evidence of the ephemeral appearance of a landscape: « ... as historically happened to the architecture, even for the landscape have therefore emerged specific representation's forms: the 'beautiful nature', in fact, has primarily been represented, in modernity, through pictorial codes and cartographic data. These have come to the contemporary, becoming bearers of ways of seeing, or consider the landscape, in a 'picturesque' way the first, in an objective and quantitative, the latter» [8].

If, then, for reconstructing the history of a landscape are important, together with the tools of *landscape archeology*, also visual documents produced over time, even though they often are not directly aimed at the annotation of specific data, we understand how significant is today the representation's role in the process of landscape's documentation.

Representing the landscape it does not mean only transfer the objective physical space – or the geographical one – on a two-dimensional paper: real space must be graphically represented also those peculiar properties, independent of the projections.

The drawing's task is, therefore, to define a landscape's mapping, by appealing to an accurate semiotics. In this sense, the expressive codes must take into account the perception's laws, ensuring for the signs both the relevancy with the meanings, and a proper expressive capability with respect to users, so providing them the space's experience, through conceptual logic operations. Unlike the photography, which often has been assigned the task of capturing the landscapes' state – intended as sensitive landscapes, as showy forms – the maps, with their own systems of signs, must have the ability to abstract and to mean, not only providing information on shapes and quality, but also on the cultivation's types, on territorial organizations to them correlated, on mode of cultivation, on the aspects and aesthetic values (colours, provisions etc.). Aspects that are essential landscaped data, able to restore the spatial and visual experience of these. In modern cartography is possible to identify some significant representations, to that effect, even if not directly oriented to the landscape.

Instead, what this research aims, in the light of new media and infographic representation's technologies, is the definition of a renovated relationship between drawing and knowledge, so opening up the possibility of combining the use of different resources from various fields.

This is a currently underway research, of which are shown, by way of example, the results of an emblematic case study.

Fig. 4: Two examples of terraced lemon orchards of the Amalfi Coast

3.1 A case study: terraced lemon orchards of the Amalfi Coast

In order to explain the possibilities and the specific values of the graphical representation in the processes of analysis and documentation of the rural landscapes have been taken into consideration different typologies of landscape located in the coastal area and inland, and belonging either to hills and plains contexts.

In this paper it is presented the types of terraced lemon orchards that represent a fundamental part of the agricultural structure of the Amalfi and Sorrento Coast. It is a meaningful case study, full of historical and cultural components of perception. For this typology of landscape appears therefore necessary to pay great attention to the preservation not only of historical and economic-productive elements that influenced its evolution but also those related to the perception. This anthropic landscape is able also to express visually the identity of social groups that determined it. The case exposed in fact provides a landscape typology that, throughout its evolution, has maintained a certain integrity in terms of characterizing and structuring elements, be they geomorphological, structural, infrastructural or cultural [9]. Furthermore it is possible to draw upon a relevant documentation which allows drawing attention on the development of signs and modes of representation able to return and make recognizable its characteristics of identity.

Fig. 5: On the left: J. D. Harding, view of Amalfi and its Capuchin monastery hung on the sides of the mountain. On the right: an image of Amalfi from the sea.

In the process of analysis and evaluation – even graphics – of this kind of landscape is important to study on one hand the features that allow us to identify the type (i.e. biophysical structure, vegetation and land use)[10], on the other the value that is derived directly from the functions that the landscape is able to perform in terms of satisfaction of needs, materials or just of perception. In the Amalfi Coast area, the agricultural space coincide, since ancient times, with terraced systems that have transformed land disposed on coastal slopes and dolomitic limestone, steep and rugged, originated on deposits fall of pumice and ash, in those 'gardens of paradise' often celebrated by travelers of the past. While they were a source of wealth for the agricultural trade of precious varieties, they have defined also the basic track on which is founded urbanization. The structure of the terraces appears different because of the slope, but generally all are supported by dry stone walls to prevent the precious soil, taken from the rock through ingenious and laborious work of clearing, being washed away by rainwater. If in other places of the region the process of human settlement, over the centuries, has largely reduced the domain of crops on terraces, on the Amalfi and Sorrento Coast terraces are so far the only cultivated areas, and here are still prevalent the citrus and olive trees. The patterns of the "walled gardens" that integrate with the buildings, typical of the steeper slope of the Sorrento Coast, oppose to the terracing of the Amalfi Coast characterized by "hanging gardens" where are prevailing lemon trees. As written by Laureano «the whole Amalfi Coast is a chisel of terraced fields that ascend the landscape, surround the coasts and mark the headlands. The rugged terrain makes the terrace the true protagonist of the whole spatial organization: the hanging garden, the design of the wooden buttresses, the plots that structure the same town plan» [11]. The crops on the terraces have had, throughout history, various changes but their exploitation has always been intensive all owing both the cultivation of trees and vineyards with grapevines, trained onto chestnut-pole pergolas, and horticultural species in order to create a self-sufficiency production. However, the commercial opportunities stimulated the cultures of profitable and valuable species such as citrus fruits, especially lemon. «The technique of cultivation of this precious

fruit, known since ancient times, is encouraged by the experience of the medieval Maritime Republic of Amalfi with the introduction of agricultural and hydraulic knowledge, result of the relationships that the area has with the North African and Arabic world [...] The organization of the system of terraces allowed the use by gravity of the waters that were intercepted on the height of the mountains and routed through the stairs and the collection tanks to the successive terraces. Each terrace was connected to an intricate system of irrigation canals fed by streams, springs and cisterns of rainfall. The collection and distribution of water was ensured by a dense network of natural waterways and canals that brought the waters 'by gravity' and came in the terraces and large stone tanks called '*peschiere*' [11]. On this system was based also the organization of the settlements realized on terraces and connected with the crops by access stairs or streets called '*lavinare*' built along the lines of the water. «The urban centers of the Amalfi Coast as Positano, Amalfi, Ravello and Maiori are structured along vertical lines on embankments, overhanging on the mountain eyelashes: they are hanging garden cities. The neighborhoods are connected by countless stairways and alleys leaned to the steep slopes that form the only possible ways of communication. The houses following the plot of the water flows are developed in successive spirals on the side of the mountain are located according to the position of the cultivated terraces and are themselves terraces and garden. They are assembled on one another and the terrace-garden is always an integral part of the house itself, covering an essential function for everyday life: it's a place of work, communication, aggregation» [11]. The terraced cultivation systems appear still sufficiently intact, although the urban expansion has led to the abandonment of many agricultural areas. «The reasons are structural and all ultimately stem from insufficient yields depending on the high costs of traditional management systems and terrace maintenance for which it is now hard to find qualified workers» [12].

3.2 From historical cartographic reading to infographic modelling; from mapping to a hypothesis of cataloguing

The great landscape importance of the Amalfi Coast's agricultural areas significantly highlights the problem of its preservation. In fact, if on the one hand the crops represent an economic resource of the area, on the other the same landscape structure, in the symbiotic integration between built and natural space, is firmly anchored in the terracing works, that have characterized the anthropization's mode and the town planning of an impracticable landscape, very difficult to colonize. In the documentation and enhancement process of this asset, through an oriented research on graphic transposition and on computerization, it is intended to hypothesize a coding of symbols and signs, able to collect a plurality of knowledge from different fields. All received information should pass in an integrated and, as possible, standardized system, so as to foster collaborative research for the interdisciplinary study of changes and developments in agricultural landscapes.

To this end, a specific research on historical and iconographic representations, over several centuries, was initially conducted. If this analysis is a 'classic' in the historical research, it should be clarified that in this case the objective was twofold: on the one hand to define the landscape's character through some representations (particularly drawings of travelers), on the other – especially on cartography – to interpret the relationships not so much in terms of scientific accuracy, but also in terms of achievement of specific objectives related to the rural landscapes' representation, for example by highlighting the

Fig. 6: Some steps of the research's method. On the left: photogrammetric map with symbolic indication of cultivations and a composite thematic map. On the right: infographic representation of the analyzed soil, using a satellite image.

unique aspects of some specific contexts. In this analysis, it was essential to avoid common «tendency to confuse the representation with what is represented» [13], a trend that «applies to both perspective drawing and the map because both derive from surveying. The map, and the perspective drawing, often appear to present a precise representation of a segment of territory outside the window, but it does so by subtly inscribing the topology of our rounded, curvilinear world within a flat, static, Euclidian gridded space» [13].

In this way it was possible to consider some significant characters in graphics synthesis that have formed a basis for some reworkings of signs. Then the research has moved on provision of computer

Fig. 7: Cetara. Multi-layer analysis of rural landscape

graphics models of the territory, with the intention of creating mappings able to lead the viewer to think landscape represented, granting it a structure, an order and a meaning.

In relation to the representation scales were then highlighted the patterns of vegetation, the type of land-use, the systems of crops, and the anthropogenic works of reclamation of the soils. However, greater attention has been paid, in the present case study, on the representation in urban scale, capable of highlighting the specific characteristics of the soils and its integrations with built spaces. The possibilities offered by three-dimensional modeling have allowed the realization of the representations able to point out some landscape features, and above all to read in a broader way the system of relationships between natural and built space. As written by Rossella Salerno «a 3d representation can help us for example to see better the relation among open spaces and built areas; so visual simulation of urban landscapes too. We consider these devices as instruments to a better comprehension of landscape context as in order to plan as to communicate their feature to people» The integrated use of aerophotogrammetric surveys and overlaps for layers with other documents, and the use of sketches in any case have been an essential support to the work.

Downstream of a mapping hypothesis of some significant fragments of the rural landscape also examined on the basis of the most recent experiences of landscape assessment, then we tried to define a cataloguing hypothesis able to collect and integrate a set of information about the landscape: in this case were considered not only geomorphological, natural or perceptual-aesthetic information – already validly considered and indexed in a number of research studies or cataloging works related to protection policies – but also those whose proper formal connotations arise from specific crops and from the use of the ground. for that purpose An attempt was made to overcome the abstract typological classifications or a generic corology. The data in the catalogation sheets were then structured according to the logic of the database, with links to specialist sub-sheets (geomorphological characterizations, environmental, regulations etc.). The phases study preparatory to such catalogation can be divided into a preliminary one, characterized by a consultation of computerized cartography and a recognition of the territory with a photographic survey compared with aerophotogrammetric data; and an operational one, based on the geographical identification, mapping and subsequent cataloguing. The basic objective of the study is the realization of a cataloguing system to be included in a database, user-friendly but also capable of an effective visual graphics that can be communicative to an audience of non-specialists, but also a valuable support to interdisciplinary research.

4. Conclusions

In the interpretative reading and realization of agricultural landscape maps, the graphical representation assumes a role of paramount importance. In the first case the image stimulates a hermeneutical activity that, as the semiotics in linguistics, offers the possibility of understanding, through the reading of form and content, meaning and implications of a symbolic communication, highlighting cultural and social processes implicit in the definition of rural landscapes. In the creation of landscape maps, instead, the research has shown that the representation, through integrated computer graphics models – two-dimensional and three-dimensional – become a valuable tool to highlight the formal characteristics of the agricultural landscape and its relationship with the more complex dynamics of urban settlements. Furthermore, through a careful sign encoding, the representation becomes a foundational element of effective communication even when addressed to a non-specialist audience and, at the same time, a valuable support to interdisciplinary research.

Abstract

The current research aims at investigating the relationships between mobility infrastructures and cultural heritage analyzing the case of the territories located along Turin – Milan axis. The territories in between these cities are a region where the two the main centers located at the edges are fastly connected by high speed railway and highway and at the same time still interlaced with several smaller centers of the in-between territories. The presence of a network of infrastructures - belonging to the so-called long/fast and short/slow networks - could represent a relevant opportunity to discover the richness of the territories in between the main centers. In this sense it is interesting to investigate the accessibility from the main infrastructural bundle (motorway, high speed railways, historical railways, waterways) to the territories, in order to establish a better connection to and among them. Relationships should be understood as a possibility to connect two or more places, identified as cultural places, to be reached from the infrastructures (stations on railways or service areas on motorways) with different systems of transport, enhancing intermodality such as that between train or car and bicycle. Therefore, the aim is to give at the same time accessibility to tourists and better mobility opportunities for the inhabitants that could benefit from their territorial values. The research is based on two main points: the first one concerns with the identification of a methodology for the investigation of the relationships between infrastructure and cultural heritage in terms of accessibility. The analysis includes also the use of tracking technologies based on gps systems to represent the network of cultural routes for the fruition and the development of the places. The second one deals with the visual representation and particularly with the identification of a mapping system that can contribute to effectively represent the multiscale structure of such a complex landscape.

Keywords: territorial relationships, mapping, visual representation, cultural landscape, mobility infrastructure.

1. Introduction

This paper aims at inquiring the possibility to establish connections between mobility infrastructure and heritage sites, in order to create a network of cultural places along Turin-Milan axis, that could enhance the role of the territories *in between*, as part of this mega region. The research focuses on the territories between Turin and Milan that could be considered as the real framework of the whole landscape crossed by the infrastructural axis (Fig.1). This work starts from the assumption that the bundle of mobility infrastructure cannot be considered as a *corridor*, but it needs to be represented as a *network*, able to connect the territory in different ways [1]. The challenge concerns with the possibilities to make *relationships*, between mobility infrastructure, cultural heritage and landscape, in terms of accessibility and fruition of the places. In this sense, the research aims at investigating some strategies that could be useful for a better understanding of the territory and for the fruition of cultural heritage. The research methodology is based on the exploration of places, that are located all around the infrastructural system, with an inductive method, that arises from particular to general, trying to

make evident the relationships both at local and at territorial scale. The presence of *long/fast* and *short/slow* infrastructures, represent a real opportunity for local development and the starting point to establish relationships at different scales. The increase of links with cultural heritage sites, could be relevant in terms of touristic improvement of the area, but also considering the growing of existing relationships between Turin and Milan. In the last few years a lot of actions, related to this topic, have been developed, in terms of research activities at Politecnico di Torino [2] and Politecnico di Milano [3], innovation projects at Alta Scuola Politecnica [4], seminar, congress and meeting with different stakeholders that are involved in this problem [5]. The current research aims at improving the research studies presented at SAVE heritage 2011, that concerned with landscape pattern and historical structure of the territory in between Turin and Milan [6].

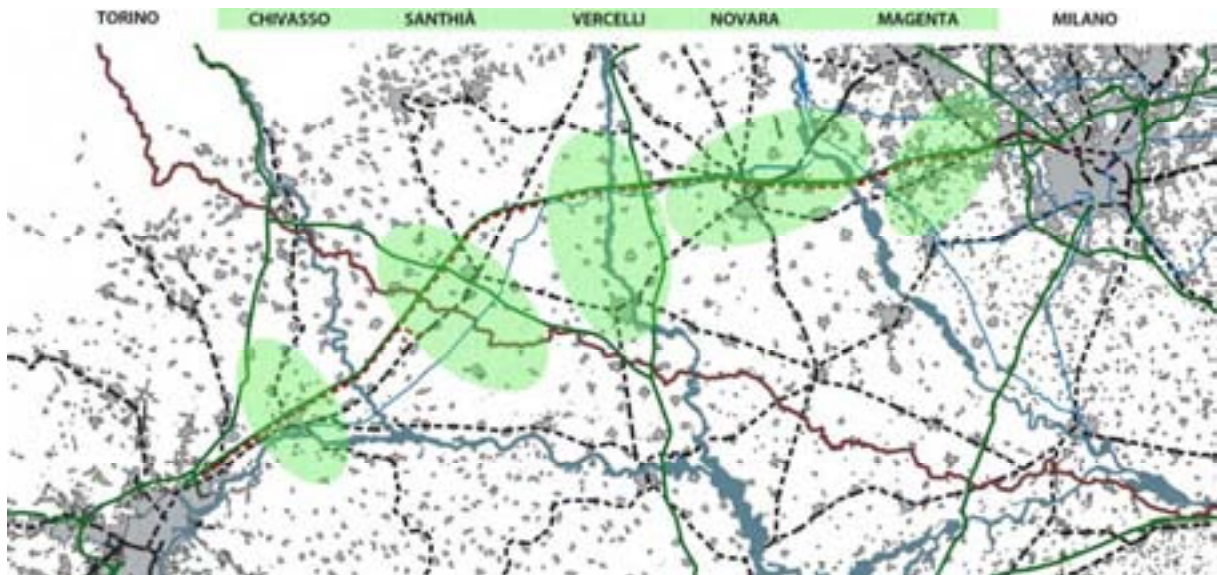

Fig. 1: The territory in between Turin and Milan with the main areas related to the infrastructural network

2. Milano-Torino *in between* territories as a network of cultural places

It can be clearly assumed that in last decades the space related to infrastructure has become an hyper frequented place in our territory, in consequence of diffused changes in terms of mobility needs and behaviors. The experience related to a journey has to be considered of relevant value, also because it keeps us in touch with landscape and with spatial framework of territories, that are crossed by the infrastructural network [7]. Though, it would be necessary a new consciousness for the territories that are along the infrastructural tracks, so that they could actively belong to mobility space. The current research aims at considering all the places localized in the surrounding space of the mobility infrastructure, that are relevant in terms of heritage and that could be connected to each other, starting from infrastructural nodes (motorway exits, service areas, railways stations). These places could be considered crucial for their importance in the infrastructural system, able to open to the territory and make it accessible. In order to have a better understanding of the issue, it could be useful analyze the territory as the result of an overlapping of different layers at different scale: a research strategy that allows to understand the real complex structure of territory. Turin-Milan axis has a really interesting structure, because of its agricultural landscape related to intensive agricultural uses (rice farming, but also orchards and vineyards), the importance of water ways system and canals for irrigation, the various cities that belong to the territories *in-between* and their cultural heritage, the mobility infrastructures that make possible the connections between different places (Fig.2).

Fig. 2: Multilayer structure of the territories in between Turin and Milan

2.1 Mobility infrastructures along Turin – Milan axis

In this sense, the infrastructural system should be understood as one of the most important layer in the territory, related to accessibility and connections of the places. The existing infrastructure along Turin and Milan should be intended as a network where different territories and sites are hooked one to each other. In this perspective, it is possible considering the presence of *high/fast* railways that connect the main cities of Turin and Milan within 40 minutes, without any stops in the territories in between. This type of infrastructure, that is the most recent one, is really essential for long trips but also to bring near the main polarities of the whole region, the cities of Turin and Milan. It is possible to consider the high speed railway as a “line/corridor” that cut out the intermediate territories. In different way, the network of local railways (realized soon after the mid of 19th century) is really important in the territory, because represent the *short/slow* infrastructural system that allow the connections in the territories in between the main cities with stops in small cities, and represents an important system for tourism development. In different words, the historical railways system has the real structure of a “network”, for its capability to make possible the connections between small cities and territories, that are crossed from this important infrastructural corridor.

The A4 motorway represents another relevant layer of infrastructure along Turin – Milan axis because of its characteristic to be, at the same time, a long/fast infrastructure that can also connect the territories in between, through motorway exits. As well as the historical railways, the motorway has several in/out points along its track (service areas, motorway exits), that could be developed in order to improve the accessibility and the connections with surrounding landscape. This research aims at identifying all the potential points on the motorway, that can be relevant for the fruition of cultural heritage and landscape.

In addition to the previously mentioned layers, the waterways and canals are very important in the territory, being the bearing structure of the agricultural system, but at the same time as a network that could connect Turin and Milan in a slow way. The presence of the historical canals (among which *Canale Cavour*, *Naviglio di Ivrea*, *Naviglio Grande*) and the interaction in a network that is still perfectly maintained and working, represent an important resource for the agricultural system and for its richly integrated landscape [8]. All waterways are a very potential infrastructure, if we consider them as the base for develop a network of cycling paths that could be designed in order to increase the accessibility in the territory. Nowadays there are a lot of existing routes that could be used in order to redesign a slow infrastructure between Turin and Milan through high spatial quality sites. In Fig.3 it is possible to see the different mobility infrastructures that allow connections between the territories in between and site of Expo, but also the possibility to use the nodes along the existing infrastructure, as points for develop new local cultural routes.

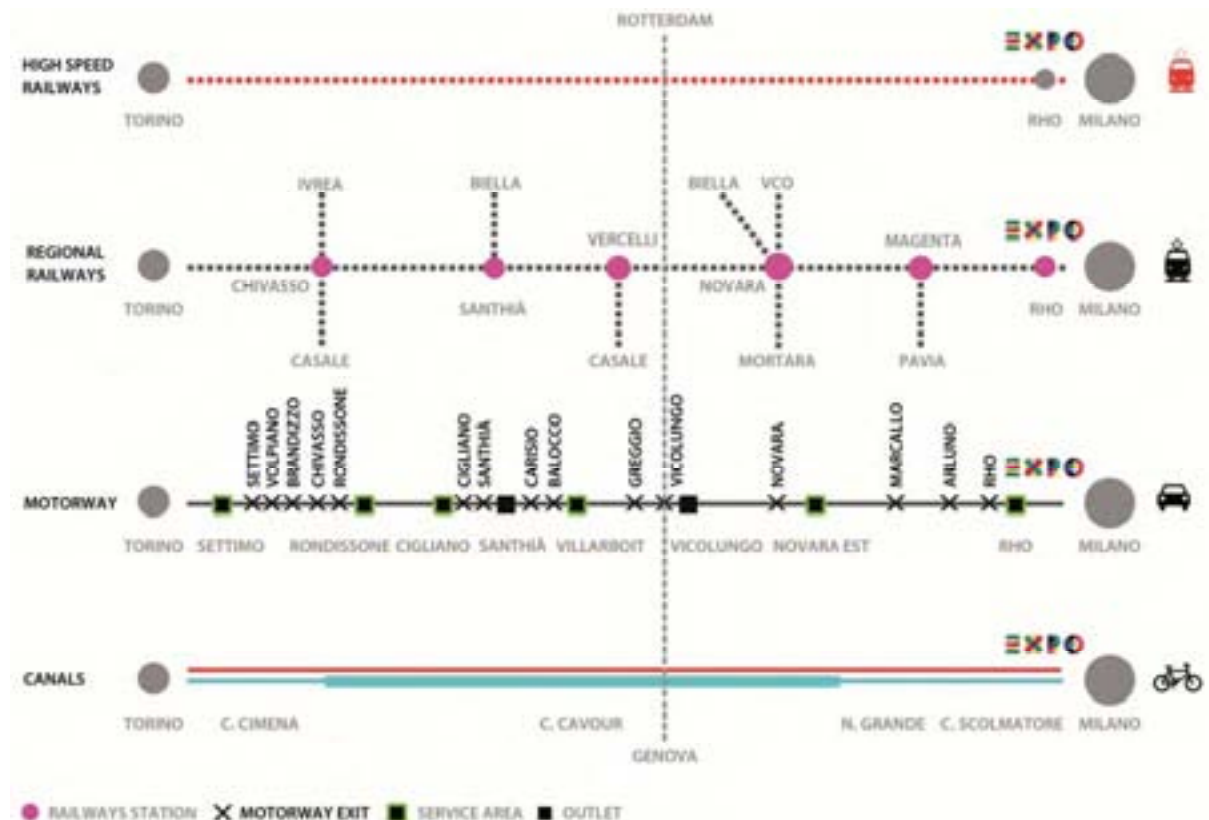

Fig. 3: Schematic representation of the infrastructural bundle connecting Turin and Milan.

2.2 The system of cultural heritage and landscape around infrastructure

The infrastructural system along Turin and Milan has been so far analyzed as network able to connect existing places, intended as cultural heritage sites in the landscape, that are located all around the infrastructural axis. The motorway and railways cross a territory that has a wide range of cultural heritage elements: rural architecture, farmhouses, small villages, historical roads, castles, abbeys; but also natural reserves, canals for agricultural system and many others. As the research aims at pointing out a network of cultural places that can be considered as *attraction points* for visitors, accessible from infrastructural nodes, a range of typical destinations has been listed and analyzed. From Turin to Milan: La Mandria historical building, Lucedio abbey, the hydrometric station in Santhià, the rural complex of Vettignè, Casalbetrame agriculture museum, Proh castle, San Maiolo farmhouse and village of Castelletto. These places could be reached by different means from the infrastructures and could represent catalyst points for territorial development, also representing a selection of different typologies of cultural heritage in this region, which are distributed in a large variety of cases, that testify of the cultural history in this region and strongly characterize the landscape of the whole area. Farmhouses represent the relationships between the agricultural landscape and rural architecture. The hydrometric station of Santhià symbolizes the complex system of canals for irrigation and its relationships with landscape. There are the old places of power, that are symbolized by castles and churches, that are located in the small village or in the rural complex. All these places could become the attraction points for people who is travelling in the main infrastructural system, but also the reference points for local inhabitants that would like to discover the richness of territory. In particular, such places could be the final destination of the Expo visitors, as they embody the true experience of Expo themes. Each one could attract people from the infrastructure and establish connections with other cultural places that are localized in the same area (Fig.4).

Fig. 4: Selection of cultural heritage sites along the Turin – Milan infrastructural axis.

2.3 Infrastructural nodes as gates to enter the territory

The presence of nodes along the infrastructural network is really important because they represent the intermodal intersection between different kind of flows. The importance of nodes is strategic for their capability to canalize large amount of information in the direction of the territory to which the same nodes belong. These places should be imagined as sort of concentration points, where data flow become accessible to the people. The concept related to a single node, as point in a network at which pathways intersect, can be extended to the concept of more nodes in a network that could be extended to the whole territory [9]. This idea becomes even more relevant if it can be applied to all nodes along the infrastructural system in order to transform the infrastructure into the backbone of a complex landscape. (Fig.5).

Fig. 5: From the concept of single node to multiple nodes as gates to enter the territory.

The current research is based on the analysis of various infrastructural networks, already mentioned in the previous section, and aims to identify which nodes could be relevant for the accessibility to cultural heritage. The investigation shows the real possibility to connect infrastructure to cultural heritage through infrastructural nodes. Different means of transport (train, car, bus, bicycle) could be used in the same trip, in order to explore the territory. Different combinations are available between means of transportation, in order to improve the accessibility to the territory. It is possible to consider relevant nodes along the infrastructure: motorway exit, services area, railways station. Each one of them has the characteristic to be a sort of “entrance” for the territory but also an “interchange point”. Railways station, located in the small cities, could represent the intermodal place where you can leave the train, rent a bicycle and start a small trip in the surrounding countryside, discovering cultural heritage, landscape, local food and so on. At the same time the exit on the motorway and service area could be considered for the same goal. In this sense, all the nodes along the infrastructure can be considered as interface between infrastructure and cultural heritage (Fig.6). These places represent the space in-between the mobility infrastructure and the rich system of cultural heritage sites. Each one of them embodies, at the same time, the territories crossed by infrastructure, but also the surrounding landscape and cultural heritage. The potentiality of these places, corresponds exactly to their own essence of places crossed by flows, where the travelling experience of tourists is integrated with the landscape and where the same landscape with its inhabitants could open a new positive relationship with the infrastructures.

Fig. 6: infrastructural nodes as *interface* between infrastructure and cultural heritage.

3. Method and Techniques

Different methods and techniques are currently available for research studies in the field of collection and management of geographical data. In particular, starting from the consideration that GPS (Global Position System) devices can be very useful for collecting geo-referenced data. Urban and territorial studies based on GPS data flows allow to achieve new territorial and urban analysis, revealing a need for specific spatially oriented approach in order to visualize information correctly. The method used in this research, starts from the exploration of each single place, with the aim to analyze in details the multiscale, local and territorial accessibility of its cultural heritage. The strategy of the research focuses the attention on the exploration of the territory through GPS devices available on personal communication terminals, collecting data and producing maps able to effectively select the relationships between linear elements (the infrastructures) and the complex topological structure of the cultural heritage, made by set of points, interconnected by local networks of roads and paths. The use of GPS is producing interesting results if we consider the possibility to collect a large amount of data in terms of space and time, with a aim to visualize them in an interactive map generated by means of a geographic information system software. GPS device allow to record points and tracks, but also to show the duration of a journey and the type of means of transport. Satellite send the signal to GPS that is able to receive this signal and send again data with other external protocols [10]. Further developments of this research, will explore the role of mapping tools and the integration of other sources of information available through Smartphone and their applications in the field of tourism also related to social networks.

Fig. 7: Tracking technologies allow to collect geographical data that could be managed with GIS.

Most recent applications for Smartphone are based on GPS. They can be used to record routes and transfer information in a GIS system for data management. In the current research the working flow is based on different steps: exploration of the sites by car or bicycle; collection of data with GPS based on Smartphone; management of data in GIS; visualization of the results in thematic maps that represent cultural routes from infrastructural nodes to cultural heritage. GIS offer to users many features and work possibilities related to map scale, layering, queries, spatial attributes database, visualizing spatial contents [11]. All of the tracks are geo-referenced and they can be inserted in the geographical system in order to study the interactions with other territorial elements. The combination of GPS and GIS technologies represent a very useful platform for managing territorial data and map spatial contents correctly. The combined use of GPS and GIS show how these technologies can be useful at two levels; the first one (GPS) is related to the field of investigation and collection of territorial data, and in a general way to the field of survey. The second one (GIS) concerns with the possibility to make analysis in a scientific way for a better understanding of interactions between territorial elements also by experimenting innovative and effective mapping tools and interfaces between users and personal devices. In the current research, the use of GPS and GIS is not related to the urban scale but to territorial scale. The investigation field is much larger than urban one and it needs to be more deeply explored. The analysis based on GPS data can be used to understand tourist behavior and movement in a defined territory. The large amount of data could be useful to determine new tourism flows and territorial marketing strategies, to manage the impacts of tourism (social, cultural,

environmental) in a particular area, the relationships between cultural heritage, landscape and infrastructure, also by encouraging and enhancing potential new behaviors of insider and outsider users of the territory [12].

4. Relationships: cultural routes as vector for accessibility

In the current research, the relationships between infrastructure and cultural heritage should be intended as a possibility to make different typology of cultural routes, starting from nodes localized along the infrastructure. The analysis of places shows the possibility to make cultural routes both at territorial scale both at local scale. The nodes along the infrastructure can be used as starting point for discovering the territory but also as intermediate point in a longer trip. First of all, the research shows the real possibility to increase the level of accessibility of cultural heritage that are localized in the territories crossed by relevant infrastructures. Secondly the research demonstrates how the places surrounding and distributed along the main infrastructure, could enhance their territorial role, encouraging their accessibility by different mobility modes and, thus, a better relationship from and to the infrastructural nodes. Thirdly the research shows as the application of modern technologies can be used to collect data and to map them in a most effective way. The presence of infrastructure should be considered in a positive way according to major accessibility of places and tourism development. To conclude the method of inquiry reveals that some areas, that could seem apparently out of the bundle of infrastructure, instead they could be connected to the infrastructure and represent a very potential areas for tourism development. Making a network of cultural routes, starting from the nodes along the infrastructure, could be considered a great opportunity for discovering the territory in between Turin and Milan, in order to make accessible the richness of existing cultural heritage and landscape from the perspective of infrastructure. In this perspective, having pointed out that the infrastructural network of the region between Torino and Milano is so strictly related to the agricultural landscape, the Expo event that will take place in Milano in 2015 could act as a catalyst of territorial innovation, contributing to promote the accessibility of the territories and their better use as an important legacy of the event.

E-mail: maria.marabotto@polimi.it; mp.marabotto@gmail.com

Abstract

This study arises from an interest in the urban landscape and the places in which we operate. It's inspired by G.C. Argan that says "in places, frequencies, paths, sites and objects of the city is defined its symbolic and mythical value".

The fountains, the statues, the columns, the obelisks, the triumphal arches, the parks and the ordinary architectural structures - that are in public spaces - are the important themes of the 'pretty face' of the city.

The fountain in the urban scene, when enjoyed in everyday life, manifests its fantastic ability and reveals itself as a key to the civil context. It is a fascinating witness that evokes a strong emotional impact because it represents the interaction between the urban landscape and man; so the fountain can also be considered the soul of a historical period. It is architecture, not only an architectural element, thanks to its expressive and formal determination of the built environment.

In Turin, the fountains have an added value for the aggregation of citizens and the feelings and emotions revealed: two allegorical themes such as the time (existence, memory) represented by months, seasons, work and the nature (life, joy) shown with moving water, provide insight into the urban environment in different ways and different levels: from the physical to the symbolic.

The research aims to demonstrate the value that the fountains have in the urban landscape as an active element, through sketches, geometrical surveys and historical research.

The documentation is also aimed to highlight the feelings and emotions that identify the city quality, to discover the pleasure and the "atmosphere" of places in Savoy capital.

Keywords: fountains, water, urban environment, the shape of water.

1. Premise

The interest in the urban landscape and the environment in which we operate, cultural heritage indwelling in the places, the respect for the values and architectural signs present in the town has motivated the present study. In this regard, G. C. Argan says "in places, frequencies, paths, sites and objects of the city is defined its the symbolic and mythical value."

The fountains, the statues, the columns, the obelisks, the triumphal arches, the parks and the ordinary architectural structures - that are in public spaces - are the important themes of the 'pretty face' of the city. They are signs aimed at identifying a symbolic environment.

The fountain in the urban environment is manifested in all its fantastic ability and proves as interpretative key the civil context. It's a fascinating witness that evokes a strong emotional impact because it is reason of interaction with the environment and man. The fountain does not tell only the space, but it's the soul of an era; it's an architectural organism for the expression and formative determination of the built environment. The space defined by water in motion is real and virtual at the same time because the form is not marked by stone, it's a dynamic configuration, a mixture of water, light and shadow, it is an unusual volume, a mobile and lively geometry that does not have a container.

In Turin, the fountains have an added value for the aggregation of citizens and the feelings and emotions revealed: two allegorical themes such as the time (existence, memory) represented by months, seasons, work and the nature (life, joy) shown with moving water, provide insight into the

urban environment in different ways and different levels: from the physical to the symbolic.

2. Water and its form

The water, the primary element in human life, has changed over time as the most different symbolism and the source has always been synonymous with the birth and life: water as the lifeblood of the world, water as energy, as a force of nature, as music and sound.

Next to the tree of life in paradise, according to the Bible, was also a source of life and youth, in every ancient mythology, from Indian to Greek, pours a fountain. All the literature popular in Europe tells the theme of miraculous waters that return the youth and vigor, tells the search for the refreshing fountain outside of paradise.

Marcello Fagiolo has investigated the meaning of water: water as the soul of the world, as life, as moral exhortation, as proof of the order of the mysterious divine plan, which obeys the perpetual cycle of water. In this regard, he writes, "the study of the Villa d'Este and other gardens of the sixteenth century could derive an actual phenomenology of water. Time to time in the fountains or ponds or waterways or in games or in the artifices we are faced with an endless series of characterizations: idyllic water, virginal water, malicious or sadistic water, erotic water, heroic water (architecture, drawings, sculptures aquatic evocations, disappearances, transformations, creative mimesis as an allegory of natural creation). Anguished water, dangerous water, deadly water, waterfall, ocean, flood." The phenomenology of water is very large both in terms of symbolic in terms of technology since there are north and south, rich countries and poor countries of water who have learned to use sparingly the little water available to them.

Fig. 1: The fountain of Frejus focal point of the square

The water system has three purposes: the visual, the vital and dynamic as that energy.

The *visual phenomenon* is influenced by the mass of water, that is by the flow rate into play but, in this case, it comes to consider water as a building material and as such shape it. Bernini, for example, is a master at playing the blades of water, that is the water to become an iridescent surface and bring up a mass much greater than it is in reality, as in the fountain in Piazza Navona. The water can be used as a small mass in the form of thin gush and multiplication gush can lead to forms of nebulization depending on the pressure in the game and then to type rainbow and iridescence phenomena. The water then acquires color or, on the contrary, can be played dropwise scanned on the musicality of the dripping.

The *visuality* water is linked to the *vitality* that it expresses, positive vitality that serves to irrigation or to spare parts of the fish ponds, then vitality concentrated in large masses or diluted, branched in a system of capillaries.

Water is also *energy*. With the action of water creating music and harmonies, but it also gives movement to statues, doors, animals: water is sound, it is music.

The music of the waters belonging to the phenomenon of nature, replacing the art. The beauty of nature is replaced by the artistic beauty, relegating the nature of water to pure occult force of the hydraulic machine, as in the mill. The water that is used for nourishment is also the "food" of art.

Is it useless to speak of a type of fountains, their myriad forms, their ability fantastic, the most famous cases in the Baroque Rome or iconography regarding Versailles.

Always fountains, energetic and blessed forces of nature, a symbol of life, a sign of civilization, a place of fantasy, games, dreams, with their song accompanied the man, giving him the most precious gift in the world. They have captured the water hidden under the ground and they have distributed providing

it to the public, and private sectors. With humility fountains have played many functions becoming troughs, sinks, tanks.

Fig. 2: The fountain of Months in the Park of Valentine.

Over the centuries, the simple source of classical antiquity has covered beauty, utilitarian function has added that aesthetics and turned into jewelry for decoration and beautification of urban centers integrating with the built environment and becoming a center of places of socialization. In art forms free and fantastic the fountain cheered squares, gardens, parks and villas.

The fountains become architectural organisms, have imitated the wealth of monuments, but the presence of water has lightened and these incomparable architectural compositions have reached the original and eloquent results.

These decorative buildings, ancient Greek and Roman times to the Middle Ages, from the Renaissance to the Baroque to the present day, have provided valuable examples in vivacity and variety of aspects, combining always, along with the coolness, their grace.

The fountain is an expression of harmony and grace. Whether you prevail bas-reliefs and statues, whether in urban or natural environment of a garden, modest or grand, it is treasure trove of beauty even when it finds its meaning in its essence, the water itself.

Fig. 3: The statues of the months as a corollary of the fountain of Months.

S

The fountains are the mark of distinction of a city. Here, the water that flows with force and shatters into jets turned on by sunlight and reflections at night, is a pretext and opportunity to highlight statues and statuary groups that reflect their image in vast stretches of water, which will abandon the game streams with waterfalls that roar and gushes gushing sudden. And watching them offer the viewer a stage, where the statues are the actors and the architecture is the background.

When the fountains are detached from the city life, they move away from the streets and squares and are placed in tight spaces or in the gardens, they renounce, in part, the effect and the monumentality and become naturalistic. They are inserted on lawns interspersed with blooming flowerbeds, among shady trees and avenues that recreate a reinvented, rich and stimulating nature.

The garden changes the image of the urban landscape and revives with its splashes of color, the gray of the city, awakening the memory of Eden where the water, source of life, is the most important factor. In this disputed the fountain loses its decorative aspect and focuses its expression in the human-nature relationship. Now the protagonist is water, is the main character in the mirror, where the jet breaks out bubbly and rises strongly, but it is also in a succession of superimposed basins where slips, slides, jumps and cascades producing a murmur, a sound pleasant it communicates with the surrounding nature.

Fig. 4: The fountain Angelica and its water games.

3. Fountains of Turin

The report describes the important aspect of the urban landscape formed by pieces of context, small identity full of life where the fountain is active element. The documentation collected with data and details is targeted to capture feelings and emotions that identify the quality of a living tissue to discover the pleasure and the "atmosphere" of places.

In Turin urban fountains located in the central area and built over three hundred years are ten and were designed and carried out using two allegorical themes. The time (existence, memory) represented by months, seasons, work. The nature (life, joy) shown with moving water.

The journey of exploration, which in this report will present five fountains, starts from the garden of the square Statute where stands the austere *Fountain of Frejus* (1871), a pyramid of blocks of gray stone punctuated by expressive white marble of the Titans defeated the work of man. Here the water flowing between the rocks, jumps and cascades in the large circular pool. The monument is dedicated to the realization of the Frejus tunnel, that is "the science that won the brute force" built for the Exposition of Turin of 1871 to celebrate the virtues of progress and the term of the work. The idea of the construction was of Count Marcello Panissera Veglio, president of the Albertina Academy of Fine Arts, who commissioned the construction of the sculptor Luigi Belli. It was certainly surprising to the citizens of Turin being in front of a living organism and original that broke the traditional figuration, more formal and rigid which tended only to emphasize the subject of the event. In this work is introduced a strong aesthetic dimension, with a big natural scenery in which it is combined lightness with gravity. The white and elegant lines of the Titans contrast with the dark and compact pyramid of square blocks on top of which stands a bronze winged figure: the Genius of Progress. The concept behind the science that won the conservatism results in the winged genius who writes in large letters the names of the authors of the project - Sommeiller, Grattoni, Grandis - and hovers on the mountain which is damaged by a lightning strike that overwhelms a group of Titans. The mythological symbolism connects to the historical event and is accompanied by water coming down from the rocks in small waterfalls and

marks the advance of knowledge in science. In the picturesque setting of Piazza Statute the fountain becomes the focal point of the new face of the urban landscape.

Fig. 5: The fountain of the rivers Po and Dora.

In the vast Valentino Park located along the Po river, surrounded by hills and the compact design of the buildings, was built for the National Exhibition of 1898, the *Fountain of Months*, with statues and statuary groups that are reflected in the tub. The fountain, built to a design by Carlo Ceppi during the celebrations for the fiftieth anniversary of the Albertine Statute, is one of the few works created for an exhibition and then exceptionally preserved. In neo-baroque style, the fountain is located on the border of the park, arranged in a semicircle on a gentle grassy slope; the statues are built around two tubs placed one above the other. The water falls from the upper vessel and form a cascade which feeds the lower tank. The statues of the twelve months are placed over the two lateral balustrades curves side. On the perimeter of the upper basin are arranged complex of statues representing the four waterways of the province of Turin: Po, Dora, the three Sture and Sangone. These groups look toward the great basin below decorated with shells and niches. The water flows, falls from the shells, gushing by the hidden fountains and by boulders that rise from the lower basin, bursting with two jets of water falling high with thousands of revelers iridescence. The concept of set, namely the representation of Piedmont rivers alludes to the Fountain of the Four Rivers by Bernini in Piazza Navona in Rome. The secondary idea of months harmonizes well with the first so that the twelve statues are arranged in a semicircle and on these dominate the four main figures.

The harmonious square Solferino includes simple tree-lined garden in which stands the impressive *Angelic Fountain* built in 1930. In the large tank reverberate the imposing statuary groups on the season enlivened by the musicality of moving water originated from seventy jets. The square, rectangular in shape, is characterized by the presence of the double masting in two rows which starts from the top of the square. The volumetric shape and capacity of the square is articulated on relations of width and length of $\frac{1}{4}$ and the width and height of $\frac{2}{1}$ that determine a sense of unity of the whole. The fountain was built to locate a point of centrality of urban space, a meeting point for people who enjoy the square. The work was done by Giovanni Riva, who created a magnificent work that amplifies the scenic effect and becomes the bottom, where the water goes on stage. The geometric virtual scheme of the fountain is trapezoidal shape and supports the construction formed by sculptural blocks whose height increases progressively from outside towards the center, thus forming a pyramid in the center of the jet. The allegorical theme is dedicated to the life cycle and winds through the three tubs of water with a round shape placed at different levels. The statuary groups, divided into male and

female figures, are accompanied by the repertoire of flowers and fruits that symbolize the passing of the seasons and the periods in which they split the man's life. The fountain is, on the whole, a vision of beauty and harmonious living. The water games in their different design and in their natural musicality, give the work a soul and a voice.

Fig. 6: The fountain of Venus in the architectural context.

In Via Roma rebuilt to a design by Piacentini (1937) in Piazza CLN, behind the two baroque churches overlooking Piazza San Carlo, were placed two fountains named after *the river Po and Dora*. According to the tank raised, the location and the small size, the fountains are an opportunity to highlight the regular appearance of the architectural composition of the new square and animate the symmetric and rigorous space. The plasticity of the two fountains creates a point of interest that attracts attention and highlights, with the sound of water that is released into the air and resonates, the harmony lean and severe of prospectuses. The problem of solving the urban node behind the two churches overlooking Piazza San Carlo was one of the most difficult tasks had to face Piacentini in the redesign of Via Roma. The two sides were formed by high walls, completely devoid of ornament and aesthetically ugly. Piacentini placed against the walls two symmetrical fountains with a theme closely linked to the city: the Po and Dora, the two rivers that run through the city of Turin. The fountains are made of a linear and geometric marble base, in style with the architecture that dominates the entire street where there are two important marble sculptures representing the river Po and Dora. From a slit of the crankcase flows, as a source, the water that is collected by a rectangular tank with slightly rounded corners. Both fountains, rich in monuments, fit perfectly in the space of square and very well solve the aesthetic problem of the background of the first section of the new route Rome.

The path along the via Arcivescovado welcomed, near the Palace of Toro Assicurazioni, the fountain inspired by the *Birth of Venus*, built in 1948. The fountain is located in the courtyard of a building, against a wall of polished stone, and consists of a rectangular tank topped by three sculptural elements representing Venus, a naiad and a triton. The main element is the statue of Venus at the center of the fountain; at its foot is placed a marine animal from whose nostrils flow water jets. Its position in relation to the complex statuary, gives full supremacy in the center of the scene.

4. Final synthesis

The fountains of Turin object of study summarize many different aspects to their historical and cultural, iconic and formal value; pleasure and utility come together in the collective sensibility of memory. They are usually placed in public spaces, that is, meeting and involvement places, places where you develop the communication; also they do not show signs of monumental and are not architectural fragments, detached environment around them

The study took into account the urban environment perceived in different ways and on different levels: from the physical to the simboli. The exploration of the fountains have identified the mechanism of the scenario of the interrelationship between the art object and the living environment. The usual classification distinguishes the types of fountains in the form I thought was limiting and does not accord with the nature of the fountains that I have analyzed so summed up: be, appear, disappear. I then expanded the horizon of the investigation by creating a link between the traditional analysis and

what is believed closer to the iconic character of object that highlights the excitement, the sense of involvement with the urban landscape.

The thematic content of the classification is divided into two parts:

- the impact on the environment in which is a fountain;
- the architectural structure of the fountain, whose identity has been taken by the selection and combination of the various components of which it consists.

The first part is illustrated the urban space in which the individual lives and acts with the fountain. The location is intended as a point of reference and in relation to the distance from surrounding structures. The configuration of the fountain interested the elements and ornamentation of the tub and interpreted by groups of statues and encumbrance volumetric. The second part concerns the symbolism of architecture, the concrete part of the representation formed by the "body" that is, the solid material which support touch of the "spirit" that is, the water in the dynamics of jets, sprays, waterfalls.

The fountain in the collective imagination continues over time to be a prominent and reference element of the urban landscape. It is an effigy able to create a center of reference for the calls to the joy and connection with nature. It helps orientation in the urban space, joins the surroundings and the contrast between the built and the movement of water creates different images. It is the result of the optimization of a set itself, but combined with the environment that surrounds it.

These architectural artifacts deserve careful consideration for the implications they have on urban morphology. The space that they generate in urban volume produces an interrelationship between urban form, content and the surrounding that is strong urban connotation. The fountain is a precious object, a distinctive element of urban space, is the historical memory of the face of a place.

Historic gardens as part of the National Cultural Heritage – a short view on a garden history in Bratislava, the Slovak Republic

Tamara REHÁČKOVÁ

Department of Landscape and Garden architecture, Faculty of Architecture Slovak, University of Technology in Bratislava, Bratislava, Slovak Republic
rehackova@fa.stuba.sk

Abstract

Historic parks represent specific monuments of cultural heritage. The Florence Charter specifies their distinctiveness in more detail. The document defines a historic garden as “an architectural composition whose constituents are primarily vegetal and therefore living, which means that they are perishable and renewable”. Currently, there are 400 sites of historic parks and gardens in Slovakia recorded as national cultural monuments. The most historic gardens are situated in Bratislava, the capital city of Slovakia. In the current urban structure of Bratislava, historic parks and gardens have been preserved in two basic ways. The first category is represented by green areas which have been preserved during the expansion of urban structure, later they become protected as historic gardens and parks and have preserved their original size up to present. On the other side, there are areas which have been preserved in part and are only fragments of other anonymous sites. This paper presents the results of research which focuses at the historic parks and gardens development in Bratislava since the beginning of 13th century up to present, and summarizes basic knowledge and suggested measures to be taken in the selected historic gardens and parks.

Keywords: historic, garden, park, Bratislava

1. Introduction and overview of the issues

Historic parks and gardens represent an important part of the national cultural heritage in Slovakia. Despite this, we can say that currently their condition is not in ideal, and many gardens and parks are neglected and deteriorating. What is worse, some of them have already vanished due to unfavourable development in society. It was caused by development in the society after World War II in Slovakia; during the time, historic sites had been quite often used inappropriately and many buildings, as well as natural features, were destroyed. In many cases, the historic parks and gardens were integrated into cities and very often have served recreational purposes. Local residents therefore started incorporating in parks their requirements on functions and amenities, e.g. children's playgrounds, which is not always in concord with historic character of an area. Some historic parks are a matter of interest of the nature and landscape protection bodies and their approach to the preservation clashes the heritage protection in some cases.

Historic park and garden sites in the Slovak Republic are divided into three categories according to legal protection:

- protected sites governed by the Act No. 49/2002 on Cultural Heritage Protection as national cultural heritage sites
- protected sites governed by the Act No. 543/2002 on Nature and Landscape Protection as protected areas
- sites with no legal protection.

Based on the data from The Monuments Board of the Slovak Republic, there are 389 objects of historic parks and gardens – national cultural sites – in Slovakia to 1st January 2012 [1]. According to

the information of the National List of Significantly Protected Landscapes of the Slovak Republic [2], there are 44 historic parks governed by the Act No. 543/2002 on the Nature and Landscape Protection in the category of 'protected area'. The law above defines the protected area as *'an area, usually up to a 1,000 ha large, with existence of natural habitats of European importance or a natural habitat of national importance, or containing a species natural habitat of European importance or a species natural habitat of national importance, and where favourable condition of such natural habitats depends on human cultivation or an area with permanent existence of protected animal species, plants, minerals and fossils, areas for natural research and cultural and educational purposes, including natural areas designed by human activity'* [3]. Historic parks can be understood as "areas of nature partly designed by human cultivation" even though many of them become also "areas with permanent existence of protected species", either plants or animals.

From methodology point of view, it can be difficult to align the nature protection interests with the preservation of architectural composition of historical gardens or parks, which contains (as it is stated in the Article 4 of the Florence Charter) the following: plans and topography; vegetation, including its species, proportions, colour schemes, spacing and respective heights of individual species; structural and decorative features; running and still water reflecting the sky [4].

The article surveys the development of historic gardens in Bratislava in the context of historical development in Slovakia. It presents the research results focusing on the identification and evaluation of historic parks and gardens within the city, and suggests measures which need to be taken to improve their condition.

2. The development of garden design in Bratislava

The first attempts of garden design in Bratislava dates back to the 13th century, when the first monastery estate with gardens were built. During the 700 years, many gardens and parks were established and in varied forms have become inseparable part of the city's image which influences the colour schemes and texture of the landscape and conditions their changeability during individual seasons in the year.

Gardens have been established and declined, and have altered in current trends. Alike many other historic sites, gardens very often contain various layers which represent individual stages of development. Therefore historic gardens and other historic parks and landscape are being paid a lot of attention not only by the public but also by the professionals. As Tomaško [5] noted, thanks to geographical conditions and political importance of Bratislava in the past, the historic parks and gardens in Bratislava rank among the best in Slovakia.

Bratislava was established on one of the most important geographic and strategic sites on the central flow of the Danube. In the 9th century, fortified castle with a market settlement below started to be built. The original status of the town started in 1291 when the king Ondrej III. (Andrew III of Hungary) granted Bratislava town privileges which commenced its administration, law courts, economic power and architectural development [6]. During the second half of the 13th century, the town grew substantially and present-day Hlavné námestie (Main square) become the city centre. Moreover, medieval towns used to be protected by fortification walls which did not allow much space for large scale gardens. For five hundred years, the town walls, which started to be built in 1297 by the order of Ondrej III, prevented urban development.

Majority of houses in Bratislava were made of wood or were half-timbered up to the 15th century. The streets were not enclosed; town houses were detached structures situated near agricultural buildings with gardens. A free standing development changed into a row-building system and wooden houses were replaced by brickwork structures. Larger gardens belonged to monastery estates, town palaces, and privileged citizens' houses, e.g. the gardens at the back of canonic houses. [6] [7] [8]

Bratislava become the capital of the Kingdom Of Hungary in 1536, and seven years later it become also an archbishop seat. Many nobility and influential personalities, who started building their mansions, moved to Bratislava to seek hideaway from the threat of Turkish (Ottoman) raids. Following the style of palaces and garden design in Vienna, Bratislava soon had some extraordinary gardens. Original borders of the medieval core of the city remained untouched and the centre slowly started developing to the east and northeast.

A considerable building development started as late as in the 18th century when the empress Maria Theresa initiated the demolition of town walls in 1775. It allowed for new development of the city. As Vodrážka notes [9], during the Baroque period, summer residences with gardens and park landscaping were built. It created a contrast between dense structure of urban development inside the palisade defence system and the newly built countryside residences. Many extensive landscape schemes were also established behind the city borders during this period.

The development of garden design in Bratislava (as well as at the whole territory of Slovakia) is specific in some respect. It is closely connected with political situation in the county during its historical development. During the 16th and 17th centuries, the era of Turkish rule over a large part of the present-day Slovakia – formerly a part of Hungary (the Austro-Hungarian Monarchy) – lasted for 150 years. After the Kingdom of Hungary had been divided into three parts, the part of present-day Slovakia and the west of Hungary, The Kingdom of Hungary, was taken over by Ferdinand I of Habsburg. When Bratislava become the capital and crowning town, it gained bigger political influence on one hand, but on the other the expenses connected with the protection against the Turkish attacks were very high and not much money was left for town development. After the Turkish attacks had finished (after 1699), the town experienced an immediate development. However the town lost its position as the capital city of Kingdom of Hungary in 1784 and the development slowed down again. These events influenced also the garden design development because at the time it took longer new ideas and development to come to the Slovak territories, in comparison with other countries.

Historic parks and gardens were preserved in two basic forms in the urban structure of Bratislava. The first is represented by landscape areas which have retained in the development of urban structure and have been preserved as historic gardens and parks while retaining their original size up to present. The other kind is represented by sites where only fragments of original gardens have been preserved and are only the anonymous parts of other sites.

3. Methodology and research methods

A combination of several methodical approaches was used in the research of historic parks and gardens in Bratislava. The early stage included a review of existing literary evidence which could provide information on historic parks and gardens. Despite a high number of historic gardens on the territory of Bratislava, literary documents do not contain much information, especially those of period origin. Even contemporary bibliography is scarce, the research of historical landscape is not really systematic and the data is rather fragmented. Based on the research materials, it is necessary to mention the most interesting at the least.

The oldest written work on gardens at the Bratislava territory is considered to be a document by J. Lippay called *Possoni Kert* (Bratislava's Garden), which was published in 1664. The work provides general information on gardening as well as factual data on layouts and species division in one of the most important gardens within the Kingdom of Hungary, so called the Lippay Garden. Precious period information on gardens in Bratislava is also part of the work of Matej Bell (24th March 1684, Očová-29th August 1749, Bratislava) *Notitia Hungariae novae historico geographica* (Historical and geographical information on contemporary Hungary). The work contains descriptions of the Upper Hungary provinces. The first and one half of the second volumes, published in Vienna in 1736, deal with the Bratislava province. Similar work dates back to the same period – the descriptions of Bratislava's gardens preserved in the work of Gottfried von Rotenstein, a traveller and explorer, the author of travel book *Reisen durch einen Theil des Königreichs Ungarn im Jahr 1763 und folgenden Jahren*. Some descriptions of gardens, containing plan of the city and its surroundings, can also be found in the work of Ján Matej Korabinský (23rd February 1745, Prešov – 23rd Jun 1811, Bratislava) called *Beschreibung der königlich ungarischen Haupt-, Frey- und Krönungstadt Pressburg* (Description of royal Hungarian capital free and crowning town of Bratislava/Pressburg).

Csákos [10] was also a devotee of the history of gardening in Bratislava. He described development of ornamental gardens, which were inspired by aristocratic gardens in Vienna, in the context of historical events. More information on some historic gardens can be found also in the publications of Faust [11] [12]. Complete works on gardens are included in the publication of Raymund Rapaics called *Magyar kertek: A kertművészet Magyarországon* (Hungarian parks, gardening art in Hungary) [13]. It was published in 1940 and also contains descriptions of the most important gardens in Bratislava.

The most significant and elaborative selection of materials which were used during the research were maps dating back to the 18th and 19th centuries. Based on the study of map data, which were very detailed, it was possible to identify layouts of gardens and trace their development (figure 1 and 2 show examples). The research sources included maps which depicted the whole area of Bratislava in line with the current artistic practice: the E. Fritsch map of 1753; the M. Marquart map of 1764; the J. L. Neyder map of 1820 and its variant by A. Lanz from 1820; the F. Koffer map of 1787 and cadastral maps from 1894 to 1895.

Further materials include map fragments, e.g. a section of a Bratislava plan by unknown author from 1780, a map by A. von Krey from 1760, a map of the Danube mapping of 1823-1845, a map of the Austro-Hungarian borderline by Walter and Cronister from 1754, a garden plan of Bratislava castle from 1770, a plan of former Heindl garden by E. Fritsch from 1768, the original layout of the Park of Janko Král' (Sad Janka Král'a) from 1776 and the map of the Park of Janko Král' from 1832.

Very valuable research sources were also various illustrations, especially historic vedute (cityscape paintings/prints). Vedute show a view of a landscape or a town in a wide scope. By researching the vedute, a lot of valuable information on historic gardens and their artistic depiction has been gathered because vedute's artistic expression is topographically exact.

From the point of view of gathering of information, the following belong among the most important copper engravings: The View on Bratislava during the coronation of Maximilian II from 1563 (wood panel by H. Mayer); Bratislava from the south from 1593 (copper engraving by F. Hogenberg); Bratislava from the north from 1663 (copper engraving by L. Schnitzer after J. Ledent); the Church and monastery of Brothers of Mercy from 1735 (copper engraving by M. Engelbrecht after F. B. Werner); the Garden on the grounds of the summer archbishop palace from 1735 (copper engraving by M. Engelbrecht after F. B. Werner); Bratislava from the north from 1735 (copper engraving by A. Kaltschmieda after S. Mikoviny); Bratislava from the north from the 1740s (copper engraving by F. B. Werner, Th. Scheffler and J. G. Pintz); Bratislava from the north from about 1750 (copper engraving by J. P. Wolf after F. B. Werner); Braunecker's mansion from about 1790 (etching and copper engraving by I. Müller and G. Prixner). The more modern illustrations used in the research include mainly historic photographs and postcards, the oldest one dating from 1880.

The on-site research mainly focused on evaluation of existing sites and on identification of nonexistent sites of historic parks and gardens and on compilation of photographs.

Based on the comparison of current state of sites and their historic development, the historic gardens and parks were divided into categories according to their current condition:

1. preserved site of historic parks and gardens in original historic style – a site whose historic state has been preserved; it also contains sites which had been restored in various styles but later have been rebuilt back to the original state
2. a preserved historic parks and gardens site of the original size – a site which still takes up its original area but its current shape does not relate to the original
3. preserved fragment of a historic parks and gardens site – a site has not been preserved as a whole, but some fragments have been preserved, either small or larger green areas
4. lost historic parks and gardens site – a site which has not been preserved, or only partly but without greenery.

Fig. 1: The Pálffy Garden on the map by M. Marquart from 1765. The garden had a complex system of terraces as its site was rather steep. The height difference in the garden itself was as much as 30 meters. Four terraces linked with staircases were formed on the south-east and three of the terraces were planted as ornamental gardens. The fourth one was a connecting space linking the two perpendicular terrace systems. Five terraces which were landscaped as a fruit tree orchard were situated on the north of the palace.

Fig. 2: The Pálffy Garden on the map by L. Neyder from 1820. In comparison with the map of 1765, the axial layout of the garden has been preserved, but the original third lowest terrace was altered in a regular and most probably baroque style. The arrangement of the rest of the site – an open space – was influenced by romantic influences: no lines can be seen on the layout plan. The garden is accessible by paths only. They wind up in soft lines from the lowest point in the south-east corner up to the highest part of the garden on the west edge.

It was impossible to follow a standard classification of gardens according to chronological order of individual styles due to specific historic development and changes in the society. To make the classification clearer, a typology which respects individual development and thus makes it special in comparison with the others is as follows:

- Medieval gardens
- Monastery gardens
- Castle gardens
- Extensive palaces gardens
- Smaller Renaissance and Baroque gardens
- English landscape parks (gardens)
- Designed landscapes.

As part of the final part of the research, an overall evaluation of research results on historic parks and gardens was carried out.

4. Integrity evaluation of historic parks and gardens sites

As the authors Šubr, Šubrová [14] stated, existing historic parks can be divided in two categories of origin:

- original parks and gardens of monarchs, aristocracy, townhouses, monasteries and cemeteries (open to the public) which were part of the urban plan at various periods and from various reasons
- public urban parks built for recreational purposes in the 18th, and more often in the 19th centuries.

During the research, focusing on the sites of historic parks and gardens in Bratislava, thirty sites have been identified and evaluated; two of them can be classified as urban public parks established during the 18th and/or 19th centuries. Twenty four sites are gardens of monarchs, aristocracy, townhouses and monasteries, and four sites are extensive designed landscapes.

Majority of the twenty four evaluated historic gardens are located in the central part of the town – the Old Town city district (Staré Mesto). One English landscape garden is also situated there – the Horský (The Wood) Park, which used to be the north-west border of the town. The other six sites are located in other six Bratislava districts.

Importance of some garden arrangements in the urban structure is fostered by the fact that they got legislative protection under the Act No 49/2002 on Cultural Heritage Protection (listed as national cultural monument), and/or under the Act No 543/2002 on Nature and Landscape protection, they were listed as protected areas.

Table 1 shows the list of surveyed sites, their condition and suggested measures. The years indicate the first written record (if existent), or refer to the year when a map show a site for the first time. In case of monastery gardens, the year of origin relates to the year when a monastery estate was established. Legislative protection is labelled as “§ NCM” in case it is a national cultural monument; if a site is protected area it is labelled as “§ PA”.

Table 1: Surveyed sites of the historic parks and gardens in Bratislava, their current condition and suggested measures

Name of site	Year of foundation	Current condition	Suggested measures
Medieval gardens			
Prepoštská Garden (Garden around Provost house)	1311	extant fragment of the historic parks and gardens site	partial restoration in historizing style
Kráľovská Garden (Royal garden)	1388	lost site of historic parks and gardens	no restoration possible
Monastery gardens			
Garden of Order of Friars Minor	1271	extant fragment of the historic parks and gardens site after a historizing reconstruction	maintenance; or a restoration respecting historic character of the site
Garden of the Order of Saint Clare	1297	extant historic parks and gardens site in a historizing style of an original size	maintenance; or a restoration respecting historic character of the site
Monastery Garden of the Order of St. Ursula	1676	lost site of historic parks and gardens	restoration possible in a historizing style
Monastery Garden of the Brothers of Mercy	1669	extant fragment of a historic parks and gardens site after a historizing reconstruction	maintenance; or a restoration respecting historic character of the site
Garden of the Order of Capuchin Friars Minor	1711	extant fragment of historic parks and gardens site	a restoration respecting historic character of the site
Monastery Garden of the Order of the Sisters of St Elizabeth	1742	extant fragment of historic parks and gardens site	maintenance; or a restoration respecting historic character of the site
Monastery Garden of the Sisters of Notre Dame de Namur	1754	lost site of historic parks and gardens	restoration impossible
Castle gardens			
Veľká (Big) Garden	first half of the 15 th cent.	an extant historic parks and gardens site of an original size	a baroque style reconstruction
Malá (Small) Garden	first half of the 15 th cent.	an extant historic parks and gardens site of an original size	a restoration respecting historic character of the site
Južná (South) Garden	first half of the 15 th cent.	a extant historic parks and gardens site of an original size	a restoration respecting historic character of the site
Large palace gardens			
The Pálffy Garden	1660 - 1663	extant fragment of historic parks and gardens site	§ NCM (the garden wing of the palace) restoration impossible
The Lippay Garden	1553 - 1568	extant fragment of historic parks and gardens site	§ NCM a restoration respecting

Name of site	Year of foundation	Current condition	Suggested measures
			historic character of the site
The Wesselény Garden	1650s	extant fragment of historic parks and gardens site	restoration impossible
The Grassalkovich Garden	1756-1760	extant fragment of historic parks and gardens site after a reconstruction	§ NCM maintenance, or a partial reconstruction
Medická [Medic] Garden	1770	extant fragment of historic parks and gardens site after a reconstruction	§ NCM maintenance, or a partial reconstruction
The Erdödy Garden	1720-1730	extant fragment of historic parks and gardens site	§ NCM a restoration respecting historic character of the site
Smaller renaissance and baroque gardens			
The Purkicher Garden	second half of the 16 th cent.	lost site of historic parks and gardens	restoration impossible
The Heindl Garden (The Slubek Garden)	1650	extant fragment of historic parks and gardens site	a restoration respecting historic character of the site
The Rayger Garden	1670	lost site of historic parks and gardens	restoration impossible
The Palace de Pauli Garden	1775-1776	a extant historic parks and gardens site of an original size	maintenance
Garden by the Illésházy Palace	1640s	extant fragment of historic parks and gardens site – part of other site	maintenance, or partial reconstruction
Garden by the Braunecker Mansion	1780	lost site of historic parks and gardens	restoration impossible
English landscape parks (gardens)			
The Janko Král' Park	1776	an extant historic parks and gardens site of an original size	§ NCM maintenance or partial reconstruction
Rusovce Mansion Garden	1782-1784	an extant historic parks and gardens site of an original size	§ NCM maintenance or partial reconstruction
Horský (The Wood) Park	1870	an extant historic parks and gardens site of an original size	§ PA maintenance or partial reconstruction
Designed landscapes			
Bažantnica Park (Pheasant hunting ground) in Jarovce	1 st half of the 18 th cent.	an extant historic parks and gardens site of an original size	§ NCM, § PA maintenance or partial reconstruction
The Pálffy game preserve in Vlčie hrdlo	1782-1784	lost site of historic parks and gardens	§ PA (part) restoration impossible
The Archbishop game preserve in Podunajské Biskupice	1782-1784	lost site of historic parks and gardens	§ PA (part) restoration impossible
Železná studnička Park	1821	an extant historic parks and gardens site of an original size	maintenance

The plan of the historic parks and gardens sites in the central city zone of Bratislava is pictured in figure 3, which depicts individual gardens according the above listed categories; they are compared to the maps dating back to the 2nd half of the 18th century.

Fig. 3: Location of the surveyed historic gardens and parks sites in the central zone of the town.

- preserved site of historic parks and gardens in original historic style
- preserved historic parks and gardens site of the original size
- preserved fragment of a historic parks and gardens site
- lost historic parks and gardens site
- projection of the object according to the state in the mid-18th century
- 12 number of the object

1 Garden around Provost House; **2** Royal garden; **3** Garden of Order of Friars Minor; **4** Garden of the Order of Saint Clare; **5** Garden of the Order of Capuchin Friars Minor; **6** Monastery Garden of the Order of St. Ursula; **7** Monastery Garden of the Brothers of Mercy; **8** Monastery Garden of the Order of the Sisters of St Elizabeth; **9** Monastery Garden of the Sisters of Notre Dame de Namur; **10** Big Castle Garden; **11** Small Castle Garden; **12** South Castle Garden; **13** The Pálffy Garden; **14** The Lippay Garden; **15** The Wesselény Garden; **16** The Grassalkovich Garden; **17** Medic Garden; **18** The Erdödy Garden; **19** The Heindl Garden (The Slubek Garden); **20** The Rayger Garden; **21** The Palace de Pauli Garden; **22** Garden by the Illésházy Palace; **23** Garden by the Braunecker Mansion

5. Some issues on restoration and management of historic parks and gardens in Bratislava

Among the most significant historic parks and gardens sites in Bratislava belong the Medic Garden and The Grassalkovich Garden. Both were established at the end of the 18th century as a display of baroque palace gardens. During the centuries, they have been changing as well as their owners have been varying. By the end of the 1980s, both gardens had been devastated and had no historic value. The Medic Garden was reconstructed between 1985 and 1988 with its historic layout being partly preserved. The lawn of the central parterre is bordered by low hedges; two lime trees alleys lead along the principal garden axis. The part of the garden, which is in line with the palace, is separated by a support wall with a metal fence. Some new garden features were added as part of the reconstruction: a new fountain, flower vases, lighting and playground for children. Restoration of the Medic Garden improved the quality of the garden and made an important change to the garden when compared to the condition before reconstruction. However, when looking back, it is necessary to mention that the reconstruction also proved some failings.

The layout plan has axial division with the main axis starting at the central point of the palace and respecting the original symmetry of the parterre, which was bounded by a semi-arched tree alley. The restoration did not solve the problem of the principal axis (280m long) – when looking at the palace from the garden, the visual connection is interrupted by the overgrown yew trees, which inappropriately block out almost the majority of the Aspremont palace. The view from the palace towards the garden is not focused; it disappears in the lime trees branches thus concealing the quite large size of the garden.

The upper terrace of the garden, which is directly linked with the palace, has not been altered; it contains a clump of overgrown yew trees and a modern fountain set in an original baroque basin. The ornamental feature of the central parterre, as well as the garden outer borders is in a derelict condition. During the reconstruction, new features, which are not authentic, were added; they include: children's playground, the garden furniture, and garden artefacts such as the domineering Swan Fountain placed on the principal composition axis – the top of parterre bend. Currently, The Medic Garden is not in good condition and it requires a partial restoration. Some features are in derelict condition, especially the walks and garden furniture. The most important drawbacks of the layout plan, the beginning and the ending of the main composition axis of the garden, needs to be solved. The eastern part also requires a new arrangement – individual features lack mutual interaction not only among themselves but also with the historic context of the space.

In 1998, The Grassalkovich Garden was reconstructed in the 1780 form. Among others, an oval parterre lawn was restored; it was bordered by walks and flower beds along with ceramic vases. After establishing the Slovak Republic in 1993, the garden became a part of the president palace complex, originally the Grassalkovich Palace. The garden remained public except a 50 metre wide band adjacent to the palace, which is separated from the rest of the garden by a glass wall.

Currently the garden is in a fairly good condition and belongs among the most well maintained green spaces in Bratislava. Still, from the restoration point of view, there are some drawbacks or problems. From the compositional point of view, the main axis (230 metres long) does not have a visual focus. In the original plan, the central space was separated by a two line alley from the rest of the space, and the view from the palace focused at the alley and the adjacent Archbishop's garden. Today the view from the palaces ends on a wall which borders the garden and Spojná Street. A fountain which had been built there before the restoration happened to be also on the principal compositional axis. At the time the garden was being reconstructed, there was a debate over the suitability of the fountain in a baroque garden; in the end, the fountain remained set in the garden.

Some controversy arises also from the restoration of a fruit tree orchard as a reminiscent of the garden's history. During reconstruction, five kinds of alternating species of decorative apple trees were planted. The bedding of the tree trunks was inappropriate therefore the trees grew to lean, and were supported only by untreated wooden beams. As very inappropriate are considered the wooden playground elements for children, which have been installed there in the past years. The garden's administrator, the Old Town of Bratislava City District, is obviously trying to compensate for a lack of children's playgrounds in the city centre.

In 2010 the Garden of the Order of Capuchin Friars Minor was opened to the town's visitors and residents, with limited opening hours. The garden is laid out on the roof of and underground parking garage, where the garden of Franciscan monastery had been before. The garden belongs to the oldest gardens in Bratislava. At the end of the 1990s, underground parking was built and the above ground park was renovated, partly following the authentic plans. The most recent layout divides the area in four parts separated by perpendicular walks (oriented north – south and east – west); in the centre they form a circular space.

The fountain/well which should most probably represent a fountain with “refreshing mountain spring water” as was referred to in some historic documents is set in a rather eccentric position. The current layout had to take into account technical equipment of the underground garage which extends above ground level as high as 2 metres. The symmetry of the original layout was preserved but the symmetry of spatial expression has been destroyed. Planting solution is simple – the perimeter is lined by maple trees with compact spherical tree crowns. The parterre is grassed but the hedges are inappropriate and the yew trees are too big for such a small and intimate space.

6. Conclusion

Historic parks and gardens are a significant testimony of the time when they were established. In their maintenance and reconstruction, as Tomaško and Hrubík [15] pointed out, the fact that their original style had been lost should not be misused – their maintenance should try to follow their original style. We should perceive them in the historic context of events and in accordance with the Florence Charter and respect their architectural composition: plans and topography; vegetation, including its species, proportions, colour schemes, spacing and respective heights of individual species; structural and decorative features; running and still water as well as greenery which contains a variety of plants, proportions, colouring, layout and mutual proportion of individual tree species. Historic parks and gardens sites deserve our attention; besides others, they need a special care also because they are highly vulnerable.

Preservation and restoration of historic parks and gardens in the urban structure of a town is a great challenge and brings also high hopes, which, very often remain unfulfilled or their accomplishment is complicated by diverse interests and by the understanding of their function and role of the historic parks and gardens. It is necessary to further develop the positive sides, to be critical to the drawbacks and continuously start overcoming them.

Abstract

The protection of 20th century architecture in France is a relatively recent activity. Apart from one exception, the first safeguarding actions on buildings built in the 1900's, date back to the late fifties of last century. Actually, it is only when the general de Gaulle came to power and a Ministry of Cultural Affairs in 1959 was created for André Malraux, that a series of measures in favour of cultural heritage were taken and the notion of monument widened to less restrictive and more modern formulations. In 1964, the Minister Malraux also created the General inventory of monuments and art treasures of France. At its express request, the selection criteria and especially the time range of the monuments susceptible to be included in the list was extended. However, when Malraux asked the responsible committee, to proceed with the *classement* of several important works of modern architecture, only few of them were accepted. The action of Malraux was, nevertheless, most effective, though certainly not without difficulties, for what concerned Le Corbusier's work. In particular, Villa Savoye's inclusion among the historical monuments of the country in 1965 preserved this exceptional building from demolition, contributing to the overall recognition of its author's work. Focusing on this case study, this paper will examine the issue of the conservation of modern architecture in France.

Keywords: Modern Architecture, conservation, Le Corbusier, André Malraux, France

1. Introduction

The process of recognition of 20th century architecture as a heritage is still a highly controversial and debated issue, both from the point of view of theoretical orientations and of the operational practices. Despite the many actions carried out by public entities and private associations and the increasing attention devoted to the issue by intellectuals, the preservation of modern architecture - referring with this term not only to the Modern Movement but more broadly "*to all architectures that use innovative construction materials instead of traditional or that produces and uses traditional materials in an innovative way*" [1] - still seems to remain distant from social concerns. On the other hand, it is far from the professionals' understanding, perhaps not properly trained to be able to work on architectures too far away to be classified as "current production" but too new to be considered as cultural heritage. The undeniable state of decay, neglect and/or alteration affecting much of this multifaceted cultural heritage of a "recent past" is the tangible evidence of the lack of a consensus on the topic and invites us to reflect further to the real appreciation of these architectural works, recalling in an imperious way the need arising from building a wealth of knowledge. A process that goes through the work of cataloguing and inventorying. It is not a case if the statement of Eindhoven (1990), with which the Do.Co.Mo.Mo. International established its objectives, devotes four of its six points just for that purpose.

Beside to a clear problem related to the deciphering of symbolic characters and values of which this *spokesman* is built, there are objective difficulties determined by the weakness of many modern architectural works, often born on assumptions of renewability and/or in any case not intended to be handed down. The fact of not being part of a monumental category of the architecture created without

an explicit memorial intention has resulted in a relative neglect of their fate by the social society. In addition, that Modern Architecture also possesses other intrinsic fragilities of typological, ideological and technological nature, that have not been sufficiently deepened by a culture of the *restoration of the modern* - or of the new as opposed to the old [2] - which is far from being consolidated.

In spite of the vast amount of documents that, unlike classical architecture, is often available in relation to the elements of modern architecture, the knowledge of this latter is often superficial, due to the lack of in-depth analysis carried out over the years by the scientists, as result of reflections and awareness. Graphic documentation is often inaccurate, based on design drawings that can differ substantially from the work carried out. The same use of the survey as the basic element for the understanding of architectural work - an instrument which cannot be disregarded in the approach to the comprehension of a historic building - is often omitted in the case of modern architecture that mix the "building familiarity" up with its real knowledge.

Unlike historic heritage, the modern one has a few problems and specific characteristics that affect substantially the intervention procedures. Its degradation is frequently related both to constructive and performance problems; the reasons for his decay often widespread and premature are generally to be found in the use of materials and techniques not sufficiently tested, in the lack of consistency between spatial features and new functions or even in an absence of flexibility in the actions dictated by the necessary technology adjustment.

Here's how, in the restoration of such architecture, it is necessary to take account of specific modes of operation, subtracting them to the application of the *"methodological criteria applied to the restoration of monuments, as well as they have been coded in the last two centuries"* that would lead this heritage to *"certain death"* [3]; implementing, on the contrary, an in-depth knowledge of technical, construction and material aspects, also in relation to their durability, reactivating, or rather re-composing a dialogue, which has become rare in recent times - but yet essential - between both designers and restorers and *"architectural conservation and transformation of contemporary contexts"* [4].

Finally, the conservation and restoration of modern architecture have inevitably to confront with the question of "quantity", i.e. the amplitude (in numerical terms) of such heritage of buildings. Unlike the "old" ones came down to us after having already been selected by the action of weather, natural disasters and wars, demolitions and replacements carried out by their owners, the "modern" buildings are numerous, both because they were made in large numbers and/or serially and they not have already been scored or destroyed by the factors described above. This raises issues related both to the amount of maintenance interventions and to the question of operating a "selection" finalized to the safeguarding, not devoid of complexity of theoretical nature (such as the establishment of evaluation criteria) and limited by the regulations. A legislation that in Italy appears to be somewhat disturbing to the city's architecture, considering that the verification of the so-called "cultural" value is based on two elements: the buildings have to be the work of the author no longer living and their execution date back to over seventy years. This is a boundary that is dissimilar from the rest of Europe, where perhaps the most striking case concerns the Weissenhof Siedlung in Stuttgart, symbolic element of modernity built for the exhibition of the Deutscher Werkbund in 1927 and put into a regional Denkmalliste in 1958 [5].

Recent publications have sparked the debate on these issues, focusing on the criticality of the law and on possible changes of the legal instruments [6], obliging us to turn our gaze to the laws of other European and non-European countries. All that, in the awareness of the international dimension that today have taken the issues of the protection and management of the territory, considered not only as an economic good but also a powerful icon of identity [7].

In this context, it is of some interest to analyze French reality, taking special attention to one of the main and emblematic cases in the safeguard of Modern Architecture: the one linked to the *affaire* of villa Savoye.

2. André Malraux and the origin of modern heritage protection in France

In France, the first actions in favour of the monuments of the 20th century, begin to take place in the '20s as part of a process of sacralization of the sites of the First World War and of places subject to major fighting (that French wanted to keep symbolically in the state of devastation caused by enemy fire) or even of memorial monuments set to honor fallen soldiers. The derogatory application of the law of 31 December 1913 on the historical monuments that did not allow the *classement* of recent objects was so motivated by the desire to perpetuate the memory of the "crimes" committed against the country. This desire for protection was confirmed after World War II when other icons of the national martyrdom, such as the Natzweiler-Struthof concentration camp or the village of Oradour-sur-Glane were subjected to safeguard procedures [8, 9]. Ruins were regarded as "national monument" to be kept in the *"best possible state of destruction"* to show to the world and over time, the damages suffered by France during several years of oppression and violence.

Before that date, some buildings had already received, however, the privilege of protection. The villa built in 1913 in Bellevue Mont Saint-Michel in neo-Gothic style, was classified by decree of September

12, 1931. In 1955, the Parisian apartment of Georges Clemenceau (transformed in 1931 into a museum) was protected thanks to the prestige enjoyed by its owner. However, the first real protection activities grow later, in the late '50s, and then in a more systematic way (following a clear political will) in the course of the '60s. On 11 December 1957, the theatre of the Champs Élysées in Paris by Auguste Perret, built between 1911 and 1913 was listed under the law of 1913 on historical monuments. The death of its author, which occurred in 1954, broken the unspoken rule of historical monuments commission based on the prohibition to protect the works of authors who were born less than a hundred years. It thus ensured a recognition that it was claimed (it would seem) for several years [10] and that for the first time was motivated by the formal characteristics of the work and by the role it played in the history of architecture [11].

At the same time, similar reflections were carried out within the French administration. A preliminary list of 150 modern buildings considered worthy of protection was prepared by the inspector general of historical monuments Albert Chauvel in September 1957. This list, although limited to the city of Paris and the Seine Department, contained a number of examples belonging to the early 19th century that could be "*protégés au titres des monuments historiques*". In April 1959, a second list of sixty buildings to be protected was established [12]. Only partially inspired by the previous example, it included only monuments after 1848 spread throughout the French territory: the Sorbonne nouvelle of Henri-Paul Nénot (1882-1901), but also the buildings of Robert Mallet-Stevens, numerous churches and even the department stores Le Printemps (1865) and the Samaritaine (1869), as well as other works such as the iron bridge Garabit built between 1880 and 1884 and designed by Gustave Eiffel, the Viaduct Vaur (1895-1902), the aqueduct of Roquefavour (1841-1847).

André Malraux, from January 1959 leading the Ministry of Cultural Affairs, however, could not only participate in the formulation of such theories, resulting from administrative logics for him no longer shareable [13]. Man of word but also of action, he felt the need to express themselves through concrete actions: those "*whims by honest person*" that will characterize his personality and all his work [14]. The repeated complaints by André Chastel in the newspaper *Le Monde* had already attracted the attention of the Minister on the fate of French modern architecture [15]. That's why in 1961, he decided to take action in favour of the protection of certain prestigious buildings of the 20th century, so launching a campaign for the protection of "recent and contemporary" buildings. The large number of buildings to safeguard requested the enrollment on the *Inventaire supplémentaire des Monuments Historiques* (ISMH) but the article 2 of the law of 1913 disposed, in a very restrictive manner, that only to those having an "archaeological interest" could benefit from this measure. To this end, he will change the rules for historical monuments by the decree of 18 April 1961.

From that moment on, two years of unexplained inactivity followed until April 1963, when an *ad hoc* committee for the modern monuments was created. This committee will define a new list consisting of one hundred exemplary buildings of their age, according to a chronological breakdown that from the Second Empire was concentrated in the early years of the '900 and ended in the period 1925-1940. The criteria for selection resided in the representativeness of large recognized masters, in the majority architects and some still living. Among others: Hector Guimard (recently rehabilitated by Nikolaus Pevsner on the occasion of the exhibition *Les sources du XXe siècle: les arts en Europe de 1884 à 1914* [16]), Tony Garnier, Auguste Perret, Henri Sauvage, Eugène Beaudouin and Marcel Lods, Jean Prouvé, Le Corbusier. Technical innovation will be another of the criteria on which the selection will rest. The list included, for example, the first reinforced concrete building built in 1892 by François Hennebique at n° 1 of rue Danton in Paris on the plans prepared by the Lyonnais architect Edouard Arnaud.

In addition, in 1964 by the decree n° 64-203, the Minister Malraux created the *General inventory of movable and immovable heritage of the country*. Malraux hoped that this instrument "*at the same time it complements our knowledge, it will suggest a new revolutionary approach to the values on which this knowledge is based*" [17]. The official report of his speech shows that the national commission charged with this task "*will resume all consecrated ideas as postulates (...) and will probably lead to a deep revision of basic concepts on the evolution of art in France and to a real indictment of the system of values up here admitted*" which will turn later in a famous *révolution culturelle*.

At his express request, indeed, the selection criteria and especially the time range on the monuments that could be included in the list was greatly extended, no longer limited to the works prior to 1830 and only to the churches and castles, but also to the works of the Modern Movement. Despite these efforts (France will be the first European country to engage in the defense -including regulations- of its modern architecture), the recognition of the value of XXth century architecture was still far from being universally acquired. When Malraux requested to the committee responsible, the *classement* of the Eiffel Tower, the synagogue and the castle Beranger designed by Hector Guimard, a building of René Lalique, the theater of the Grévin museum, the Brasserie Lipp, UNESCO headquarters, a garage built by Auguste Perret, and even the Dutch Pavilion at the *Cité Universitaire*, the opinion was favorable only for the first 5 buildings in the list. The action of Malraux, however, will prove to be most effective, though certainly not without difficulties, with regard to the work of Le Corbusier, and in particular in the

case of villa Savoye, whose inclusion among the historical monuments of the country, carried out in 1965, saved this exceptional building from destruction, contributing to the overall recognition of the work of its author.

3. The emblematic case of Villa Savoye

Closely related to the rapport of esteem, respect and friendship between André Malraux and Le Corbusier is the case of the *in extremis* rescue of villa Savoye. A subject often approached by international scientific literature but never analyzed in a systematic and comprehensive way, especially from the point of view of conservation practice adopted. The archives of the *Fondation Le Corbusier* are full of documentation on this topic, but from documents stored in the archives, it's not possible to take criteria on which the various campaigns of restoration (or repair?) were undertaken over the last fifty years: the one carried out during the years 1963-67 under the direction of Jean Dubuisson, that undertaken between 1983 and 1985 by the architect Yvan Gury, the work directed during 1985-1993 under the supervision of the architect Jean-Louis Véret, etc. [18, 19]

Only recently, new interesting documents came to light from the folders owned by the villa Savoye administration, whose examination will be the object of a next contribution. The issue of the restoration of villa Savoye remains, however, one of the priorities of the Foundation. In this regard, new restoration activities will be shortly undertaken. So, because the causes of degradation phenomena of villa Savoye have unexplainably never been solved. Even more inexplicably is the fact that all conservation projects carried out have been based on the original plans of the author: it would seem that a complete survey of the work has never been realized.

3.1 Villa Savoye: birth and decline of a key work of the Modern Movement

Designed by Le Corbusier and Pierre Jeanneret, the villa, called *Les heures claires*, was built between April 1929 and July 1930 as a summer residence for Pierre Savoye - administrator of an insurance company - and his wife Eugénie. Additional works were carried out until 1931 in order to fix problems and make some changes, in particular relating to the colours of paintings. Situated at Poissy in Yvelines, thirty kilometers away from Paris, the house was conceived as a box suspended on top of a hill. Devoid of face and open to the four horizons, its main body was imagined as limited by four similar walls, drilled along the length of the perimeter from a single window [20]. The basic idea corresponded essentially to two criteria -movement and lightness- that in villa Savoye melted to positively respond to the long course of study and research of its proponent, in order to create the perfect *machine for living*. A path that led from confusion to the clarity of geometry: "*simplicity does not mean poverty but it represents a choice, a discrimination, a crystallization that have the effect of purity itself. Simplicity is a concentration*" [21].

Conceived as a country residence in response to a desire of *Madame Savoye* - the true interlocutor of Le Corbusier and of the workers - the house was for the Savoye a tool for self-representation in high Parisian society but also a place where to live their family life in a modern and comfortable way. A place where they could receive and rest, commissioned to be *functional* and in which a prominent role was entrusted to the car.

The wealthy Savoye charged Le Corbusier with the design of the villa Savoye, perhaps without devoting much care to the "style" but soon they had to deal with exorbitant budgets that forced them to ask several times the architects to review their projects (even five).

The estimate overruns (at the end of the villa will cost twice as much as expected), but also the many problems that affected the house, in an economic unhappy context (even in the affairs of Monsieur Savoye), made the relationships between customers and the *agence* of Le Corbusier very complicated.

This is maybe the reason for the growing discontent expressed in numerous letters written by Eugénie Savoye to a Le Corbusier (at least) initially annoyed and reticent, about numerous infiltration of rainwater in most parts of the house: "*Il pleut dans l'entrée, il pleut dans la rampe et le mur du garage est absolument trempé. D'autre part, il pleut toujours dans ma salle de bains qui est inondée à chaque pluie*" (letter dated September 7, 1936, FLC H1-12-157). The high level of humidity exacerbated the couple even more due to the fact that their son Roger suffered from tuberculosis and was supposed to spend in the house the necessary period of convalescence. This might be understandable, given the nature of the building, especially because of the materials and techniques of that time, but is certainly strange, given the proverbial care adopted by Le Corbusier for the construction details, often innovative, especially focusing on window frames and on stormwater discharges from hanging terraces. Many failures, however, would have been easy to solve, if only Le Corbusier had responded to the requests of the couple with the same diligence with which preceded the visit of many visitors or even if he had supplied them with the ever delivered "*plans de la maison*" (letter of 4 November 1939, FLC H1-12-156). Pierre Savoye complained, moreover, the inadequacy of the boiler and radiators: he declared "*we are freezing*" in a house where it was impossible to reach a reasonable temperature. Actually, in the article published in 1930 on the *Architecture d'Aujourd'hui*, Posener already wondered

if the house was not too big in spaces and however difficult both to clean and to heat; "*perfect*" but certainly not from the economic point of view [22].

The advent of war obliged the Savoye to settle for a certain period in the house in order to avoid the consequences of eventual bombardments on the capital. Occupied by the Germans and then following the *Liberation* by the Americans that will damage it considerably (*portes arrachées et meubles emportés* wrote Le Corbusier [23]) the future of the house will then be strongly affected by the large-scale operation conducted by Ford in 1937 which established in Poissy a large factory car. After the war, the factory was taken over by Simca, a motor manufacturer famous in France for its economy cars, which extended it further, increasing also the annexed worker's village. in Beaugregat. Built by Charles-Gustave Stoskopf, this *grand ensemble* included a church, the hospital, primary schools and supermarkets. The only thing it lacked was a high school that the Ministry of Education decided, in accordance with the municipal authorities of Poissy, to build right on the ground of villa Savoye so condemning it to the demolition.

It followed the actions taken by Eugénie Savoye (in the meantime became a widow) and by his son Roger to get the right compensation, as well as that of Le Corbusier in order to save his work. The Savoye did not oppose, in fact, to the expropriation whereas the villa in their ten years of stay did not offer them the peace and comfort they would like and that would justify the investment of large sums of money to make it habitable again [24]. After many negotiations and legal procedures, in 1959, the court set a compensation considered acceptable both for the town of Poissy and the Savoye (1,271,875 new francs). The villa would be demolished to make place for the new high school in Poissy.

3.2 From the international mobilization to the role of André Malraux

At the same time, a strong resistance is carried out by Le Corbusier who, alerted by the upcoming demolition of villa Savoye, decided to inform all his connections - first of all André Malraux - about this pressing danger.

The two had become friends after a journey that the minister had made in India and his discovery of the construction site of Chandigarh, by him perceived as a revelation from symbolic, spiritual and material points of view (fig. 1). An architecture, the one designed for the new capital of Punjab, able to go beyond the assignment and to plenty situate itself, in the field of monumental architecture [24]. The fascination exerted by Le Corbusier became even stronger during the journey of the minister in Brasilia, where the insistence of the local authorities for entrusting the architect with the future project of the French Embassy, attracted the attention of Malraux on the international prestige of which Le Corbusier benefited. An admiration which he manifested in a number of occasions, even more personal, such as the one linked to the 100th birthday of the mother of Le Corbusier (the telegram of congratulations sent by the Minister will make history).

Since his appointment as Minister of the Information in 1958 and again later when he will assume the role of Minister of Culture, André Malraux's help will be repeatedly called by Le Corbusier, in order to solve problems related to its studies or ongoing projects, as well as to get new assignments (fig. 2 and 3). Since 1959, the issue of the protection of his works will become to Le Corbusier a matter of primary importance: from this date, its relationship with André Malraux will then focus on this subject.

The news of the beginning of expropriation procedure concerning Villa Savoye, had urged Le Corbusier to contact in the United States. Siegfried Giedion, a very famous architectural historian and professor at Harvard, informing him that an association, the *Cercle d'Etudes Architecturales de Paris*, through its president Pierre Sonrel, had requested the intervention of the Minister Malraux in favour of villa Savoye. Although UNESCO was solicited to proceed with the purchase of the property, lack of funds had been forced to give up (letter of 25 February 1959, FLC H1-12-182).

He then asked Giedion to bring into play all his relationships both with UNESCO and the United States to save Villa Savoye. Giedion began as an international mobilization that in a few days was expressed through numerous articles in the British and then in the French press (fig. 4), as well as in appeals to the Minister Malraux such as that of the E.T.H. Zurich whose rector A. Roth will specify that villa Savoye was "*not only one of Le Corbusier's universally known masterpieces, but moreover a monument to 20th century architecture, recognised as such in professional circles worldwide*" (letter of 9 March 1959, FLC H1-12-191).

Nevertheless, anything was really changing and Le Corbusier wrote again to Giedion informing him that the Savoye property could be purchased for 100 million Swiss francs. He also expressed his intention to create a foundation, the *Fondation Le Corbusier* which will become his one and only inheritor. The foundation headquarters will be *villa La Roche*. Focusing on the future of Villa Savoye, Le Corbusier also affirmed that one of its main goals would be that of serving as a point of departure in the Western hemisphere for an alternative means of research (other than academic) into architectural development from ancient times to modern day (FLC H1-12-188). In this regard, it has been observed by Jacques Sbriglio that this touching letter, apart from announcing almost ten years in advance the real establishment of the foundation revealed that Le Corbusier "*did not have a very clear idea at that*

Fig. 1,2 and 3. Le Corbusier and André Malraux in Chandigarh and Paris (FLC L4-14-95 and 96). Fig. 4. The cover of *Time*, May 1961 (FLC X2-1-150).

time as to the future role of the rehabilitated Villa Savoye" [25].

Perhaps Le Corbusier was as little aware of the role that the State could play in favour of Villa Savoye. On 8 June 1959 he wrote to the Minister Malraux to let him know that this international mobilization had been developed behind his back, even pretending that at the time when all the commotion concerning the villa Savoye broke out, he was in the Indies. If on one hand he seemed to apologize for the pressures produced (a mere pittance compared to what he will do after for this and other affairs!) on the other hand, with great cunning he tried to instill in the Minister the awareness that villa Savoye could find its very *raison d'être* only in the uncontaminated place in which it had been conceived. Supported by a *Comité de sauvegarde de la Villa Savoye à Poissy* created in April 1959, André Malraux recognizing the value of that work, started to concretely take action in his favour. There were, nevertheless, some obstacles to overcome. Conscious of the fact that the commission for historic monuments was not sufficiently "mature" to express a favourable opinion for the protection of this architectural work, he decided to work around the problem *hors du champ de la protection des monuments historiques*. In a very unusual way, he created the conditions for the acquirement of villa Savoye by the State and, thanks to an agreement signed October 23, 1961 with the Ministry of National Education, this latter, once having become the owner of the land for the future high school, would transfer the building to the Ministry of Culture to there harbor an international foundation. According to the same rule of *détournement*, also the site on which the chapel of Notre-Dame-du-Haut at Ronchamp had been built, thanks to André Malraux, and despite the strong opposition of his administration, was protected on 11 March 1960.

3.3 From the Villa Savoye's protection to a policy in favour of modern monuments

Moving back to the case of villa Savoye, the years that will bring to its protection were eventful and far from being simple. Years in which Le Corbusier intensified his personal commitment in the battle in favour of Villa Savoye. Determined not to be pushed aside in the matter, he strengthened its offensive first of all to prevent the construction of high school, then to get the job on the restoration project, and finally, to maintain a healthy weight in the choice of new eventual functions for the house.

In the early '60s, he was invited to take part in a meeting convened by the *Section Spéciale des Bâtiments d'Enseignement du Conseil des Bâtiments de France* about the new high school construction project in Poissy, modified following the protest campaign raised following the proposed demolition of the villa. Le Corbusier called to express his opinion, was in favour of the new principle of construction of the high school while stressing the need to preserve Villa Savoye's perspective, so implying, as a consequence, the relocation of the gymnasium near the high school. He also took a stand on the function which could be assigned to the villa, proposing that it could be the headquarters of CIAM, showing himself ready to elaborate the project of restoration and to supervise the work. (FLC H1-12-249). This last question is of fundamental importance for him, so that after a typo in the minutes of the meeting, he reiterated in a note to the Ministry of Culture that "*it is out of the question that any architect other than myself be in charge of this work*" (FLC H1-12-248).

Worried of not being in total control of the situation, he decided to send some sketches to the Minister Malraux showing the degraded state of the villa: the building of a wall near the ramp leading to the terrace and in front of the large window lounge, a changing in the colour paintings particularly strong, the lack of any type of vegetation on the roof, an improper replacement of some windows, etc. (fig. 5 and 6).

Working tirelessly to achieve its objectives, Le Corbusier even tried to act on the mayor of Poissy, Mr Touhladjian to which in 15 July 1960 he sent the second volume of his Complete Works, where the

Fig. 5 and 6. Sketches addressed by Le Corbusier to the Minister Malraux showing the degraded state of the villa, 2 April 1960, FLC H1-12-301).

Villa Savoye appeared on p. 23-31 adding a dedication: "we seal a pact trust-based on the occasion of the Villa Savoye and I will try to deserve your approval and that of your citizens. Here is the villa Savoye, born in 1929. It was clear, bright and cheerful. Me too. Thirty years have passed, heavy of dangerous fights"(FLC H1-12-264).

Perhaps for an insane optimism, absurd euphoria or just as a provocative act, Le Corbusier from 1962 multiplied its communications to the Ministry of Culture. Taking for granted that he will be entrusted with the restoration work, it asked for preparation of budgets, alerted his colleagues and his most trusted companies, including Bertocchi's enterprise. Therefore, he also involved the former Minister Eugène Claudius Petit informing him that the future *Fondation Le Corbusier* will sit in villa Savoye, specifying moreover that he was also making plans for the transformation of the villa in *musée Corbu* and adding, probably making a mistake, that the heating and electric systems would be completely redone and windows considerably changed. This intention of modifying some original characters of the villa will have a considerable influence on subsequent events concerning its restoration.

In September 1962, the Minister Malraux officially informed Le Corbusier of the progress of the Villa Savoye's dossier: the transfer of the property of the Ministry of Education had become effective from February 22, 1962. He then reassured him about the possibility that he would be in charge of all the repair work and alterations to the interior fitting. To this end it was necessary, however, that he would be appointed as architect of *bâtiments civils et palais nationaux* and that he was entrusted with the case. An appointment was still possible, in spite of his advanced age, as he was the author of the building. Le Corbusier, heartened by this almost designation drafted some notes accompanied by sketches through which he configured the improvements and changes to be made to the villa: some modifications in the colour scheme (different colours but only on the ceilings), the wall to be used for mural photomontages, painting in white of the structural elements (porticos and columns). Other alterations were also foreseen on the lighting system, which he intended to be indirect. He also added some other technical specification, such as those related to the reparation of waterproofing system or the establishment of a bathroom on the ground floor (FLC H1-12-461, fig. 7). But the process was slow and to Le Corbusier did not remain that supplications: "let me fix this villa before it's too late (...) I already told you that I will work for free" he wrote to the Ministry of Culture in September 1963 (FLC H1-12-444).

A few months later, however, the task was entrusted by the Ministry of Culture to Jean Dubuisson, architect of *bâtiments civils et palais nationaux* (at the beginning in a provisional, then in an official way, following the decree of 7 December 1964 that listed Villa Savoye among the *bâtiments civils et palais nationaux*). Le Corbusier learned that decision and sent the project drawings, inviting him at immediately taking action.

Actually, from that moment on, Le Corbusier was divested of all *maîtrise d'œuvre* and its field of action limited to an informal role of counsellor and supervisor (fig. 8). This had been certainly due to the slowness of bureaucratic machine but perhaps also to avoid him to do a "Le Corbusier 1963" not in line with the consolidated praxis of Historical Monuments administration. He did not give up and continued to urge persistently Dubuisson that Malraux so that the work would start as soon as possible, "the years go by, the house collapses" (FLC H1-12-418, fig. 9).

Later, he accused of inertia Dubuisson, reproached him his silences, then he gave him tips for getting the financing necessary for the commencement of work. Determined to keep somehow the control, Le Corbusier expressed in a note to Max Querrien, the Director of Architecture at the Ministry of Culture,

Fig. 7. Sketches addressed by Le Corbusier to the Minister Malraux showing the improvements and changes to be made to villa Savoye (30 September 1962, FLC. H1-12-461).

his willingness to do the work that would follow "fairly the truth," so reconstituting, in an exact way, the construction at his primitive state (letter of 10 November 1964, FLC H1-12-290). In this regard, it is telling the report produced by François Gardien, one of Le Corbusier's collaborators about the architect's point of view on the work to be performed on the villa [27]. In particular, with regard to certain repairs such as the removing of the walls in front of the glass window of the hall and up the ramp, the planting of trees around the building to re-create an environment suitable; the restoration of polychromy. All points to which inevitably corresponded as much architectural principles of the Villa Savoye - the architectural promenade, the relationship between building and nature, the relationship with colors - which had been altered over time and according to Le Corbusier would have to be restored (FLC H1- 12-312).

Again, in a note dated May 12, 1965 Le Corbusier relied on its priorities for action: "*lend colour, create a fresco with photographs of the text and the cover of L'Esprit nouveaux, redo the planters, the hanging garden and the artificial mountain* (FLC H1-12-293). Against the persistent silence from Dubuisson, Le Corbusier, tired and discouraged sent a letter to Malraux protesting for the last time the lack of operational activities at Villa Savoye. A few months later he died and an elaborate funeral was given, directed and produced by André Malraux. The Villa Savoye was declared a Monument Historique on the 16th December of the same year and opened to the public twenty two years later.

A few months earlier, on 10 October 1964, the Cité radieuse had been integrated by the Minister Malraux in the first round of the protection of the modern monuments. After the death of Le Corbusier, from September to December 1965, seven buildings were inscribed on the additional inventory of historic monuments: the Swiss Hostel and the Brazilian Pavilion at University City in Paris, the chapel Notre-Dame-du-Haut at Ronchamp, the villas Roche and Savoye. In 1966, the *maisons* Jaoul and the villa Jeanneret completed the protection of works of the "*mâitre*" (as it was called Le Corbusier by André Malraux) thanks to the intervention of his friend, the minister.

4. Conclusions

From the era of André Malraux many things have changed. In 1974, a new campaign was launched by Bruno Foucart, technical advisor to the Minister of Culture, Michel Guy. This time, the services of historical monuments were involved at both central and regional level and invited to submit lists of buildings from the 19th and 20th centuries eligible for protection. The acute shortage of documentation and the poor awareness of these architectural entities meant that not only the most important or spectacular ones were included but all those of which nothing was known, or almost. The number of protected buildings, so increased fourfold, although they were substantially located in Paris or in other urban areas. An opinion movement for the recognition of Modern Architecture was, however, initiated and will continue to produce knowledge in the next decade, despite the strong opposition of some art historians and the misunderstanding of a large part of civil society. Since the mid-'80s the lists became thematic: first, it privileged railways, hospitals, swimming pools, boutiques, industrial heritage; then, in the '90s it focused on individual and collective housing: from the prefabricated of the '40s to the *grands ensembles* of '50s-'60s. In 1987, a conference on the *Enjeux du Patrimoine architectural du XXe siècle* took place in Éveux: the need to bridge the deficit in the protection procedures through the development of systematic inventories was highlighted. The selection of buildings to protect could be

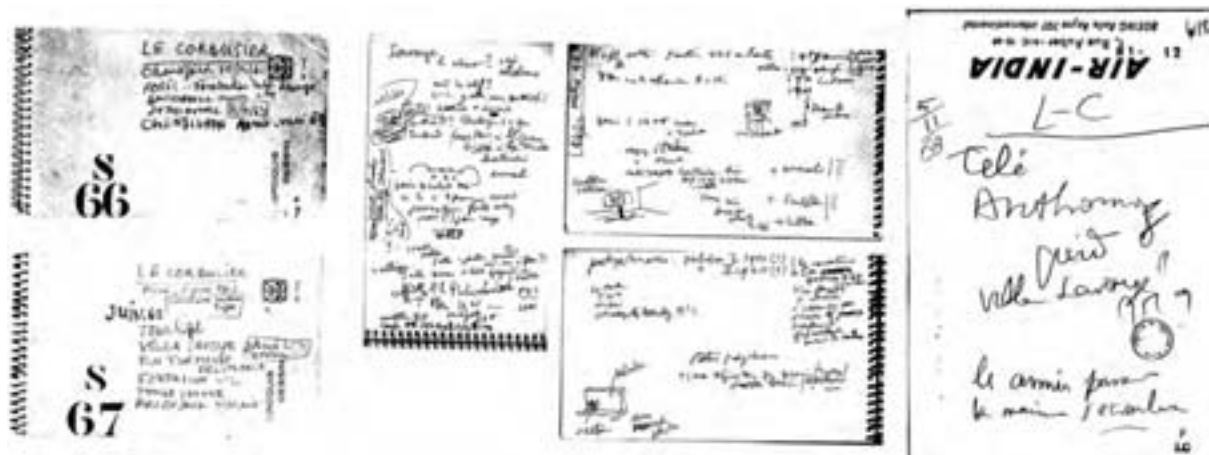

Fig. 8. Covers and pages from The *Carnet de Dessins* S66 (started on 10 December 1961) and S67 (started on 5 June 1962) regarding villa Savoye. Fig. 9. Note drafted by Le Corbusier of 5 November 2011 (FLC H1-12-418).

rigorously based on the criteria of originality, exemplarity, technical innovation, or related to their significance to the community recognition as well as to a meaningful mass production from the historical, sociological, economic and cultural points of view. The law of 1913 on the historic monuments was considered insufficient to ensure the protection; it appeared therefore necessary to use other tools such as the law on the establishment of the *zones de protection du patrimoine architectural et urbain* and that for the protection of sites. These three instruments are now in France the normative apparatus regulating the protection of modern architecture. In 1996, one thousand buildings from the 20th century were protected by the law. Today, the knowledge, conservation and valorisation of the 20th century's cultural heritage is one of the main challenges of French administration. However, it represents only the 4% of protected heritage (43 000 buildings and sites in total). Significant work remains to be undertaken in this area.

Recently, the Ministry of Culture and Communication has created the "Heritage of the 20th century" label. Devoid of juridical effect, the label is now applied to about 2,300 buildings or urban complexes (one-third between them is not protected under the law of 1913). The main idea of this tool results from the awareness of the limits of protection. Indeed, what is really useful is not to improve or extend the number of protection tools or the subsidies, but to activate the social recognition of the value of this heritage. To protect and transmit to future generations the 20th century heritage, it should be first of all identified and inventoried, then monitored and/or restored. But what appears really important is to develop actions aimed at enhancing the public awareness and understanding of this heritage, in order to re-appropriate and re-inscribe it as a significant component of our society.

Understanding Location Preferences of Entrepreneurs and Innovators in Historic Maritime Cities

Laurie ZAPALAC

Department of Urban Studies and Planning, Massachusetts Institute of Technology, Cambridge, USA
lzapalac@mit.edu

Abstract

Many important factors shape why some urban environments are becoming new locations for entrepreneurship and innovation, but generally, one has been overlooked: quality of place and its relationship to production. This leads to an important research question: *do the qualities of historic urban environments matter to skilled workers in 21st century industries? If so, why?* In my related dissertation research, I analyze firm attribute data and location data about a subset of skilled workers, those participating in information and communication technology (ICT) and the creative industries (CI) and in three historic maritime cities: Venice, Amsterdam and Boston. Data collected through interviews of workers and other knowledge holders provides invaluable insight about work practices and perceptions of the value of the built environment.

In this paper, I identify six location typologies in relationship to the characteristics of observed firms. Importantly, these typologies incorporate not only distinctions among qualitative attributes of the built environment, but also address how these qualities (at the district and building levels) are perceived by firm representatives to impact their productivity. This leads to constructive ways to describe these emergent “ecosystems” not only as spatial locations, but also as distinct places with specific knowledge attributes and important interrelationships.

Keywords: *historic environments, place knowledge, location choice, and productivity*

1. Introduction

Many scholars are engaged in explaining why some places have become new locations for entrepreneurship and innovation. Economic geography and management scholars utilizing cluster and network analysis often focus on the competitiveness of particular regions or companies within industries, by considering the importance of proximity to other firms, to research institutions, and/or to venture capital in the emergence of new creative and innovative “ecosystems.” Debate among urban scholars has tended to center on the ideas of cities as environments that attract high skilled workers through jobs, consumption or lifestyle opportunities. Recent scholarship on entrepreneurship looks to the roles of incubator, accelerator, and “startup” programs, and their ability to foster community and to assemble quickly the skillset necessary for new entrepreneurs to launch successful companies. Within these investigations, one factor has been largely overlooked: the importance of quality of place and its relationship to new forms of production.

1.1 Background and Key Definitions

Innovation has come to be a highly popular buzzword in product descriptions, policy statements and even advertising. Often, however, there is gap between the implied associations (novelty, ingenuity) and a more critical understanding of the spectrum of activity required to realize innovation. *Innovation* is the development of new products and services and their successful delivery to the marketplace. While innovation is closely linked to the idea of invention and application of new technologies, innovation scholars point out that this is not the whole picture. “Even in the sectors that embed the

most effervescent technologies, innovation is mostly driven by competitive considerations. Moreover, most of the technological progress occurs over long periods after inventors' initial breakthroughs" [1]. Maryann Feldman elaborates: "Commercially viable product innovations combine scientific and technical knowledge with knowledge of the market. A new product introduction reflects the successful organization and synthesis of these diverse types of knowledge" [2]. The prolonged period of time required for the electric vehicle to be accepted by U.S. market is an excellent example of the more complete story of innovation.

Entrepreneurship, the practice of being an entrepreneur, refers to the taking on of risk in order to launch a new, potentially profitable endeavor, including an innovative product or service. Brad Feld emphasizes that what distinguishes an entrepreneur from a small businessperson is the intentionality to launch a high-growth business that will serve a broad market, not just a local one. (Feld also points out that many programs and policies designed to promote the growth of small businesses, such as those directed by the Small Business Administration, are not, in fact, very helpful to entrepreneurs because of the difference in knowledge and resources required [3]. In considering such mechanisms, important differences between the "culture of entrepreneurship" and in the United States and Europe begin to emerge. These differences, in turn, raise questions about whether focusing on entrepreneurs is in fact good economic development (generally) and what the actual direct economic, social and environment impacts are for the city and community hosting this activity.

Responding directly to intentions to promote economic growth within a region or city through cluster development, Feldman advocates that it is necessary to study what she articulates as three stages of cluster formation, not merely the end result of the process [4]. She emphasizes that entrepreneurs play a special role in cluster formation and that local conditions matter: "The local environment, in terms of the types and quality of resources and the networks and institutions that provide support and further business interests, ultimately affects the sustainability of the startups, although not necessarily their initial establishment" [5] Importantly, she also emphasizes the relationship between production potential and location-specific knowledge: "Although not all locations can develop glamorous high-tech clusters, each location has a unique industrial heritage that provides some expertise and resources that might constitute the basis for innovation, technical advance, and sustainable competitive advantage. [6] Hence, Feldman's approach emphasizes that cluster formation is about translating latent potential and being cognizant of conditions that support entrepreneurship. It argues against offering financial incentives to established companies to relocate to the location being promoted. It is here where heritage comes into play – both when considered as a physical and social framework for activity and because knowledge itself is an intangible form of heritage.

1.2 New Industries

Since the 1960s, entirely new economic activities have emerged, facilitated by and facilitating the incorporation of digital technology into myriad aspects of work and life. These included broad groups of activity that encompass Information and Communication Technology (ICT) as well as the Creative Industries (CI), which in many cases manifest a fusion of existing forms of expression with new forms of technology, and as such rely upon both creative and technical skills. Recent studies debate which activities actually constitute these industries and how they should be conceptualized; because these are new and rapidly developing fields, some activities are poorly accounted for in existing industry code classification systems. Still, the use of classification codes is helpful, particularly as a starting point for evaluation and comparative analysis across cities.

ICT and CI industries serve as representatives of knowledge-intensive work. Workers in these industries are bringing many new products and services to market including hybrid concepts, such as social media services, for which there is no distinct precedent in any one industry. The market capitalization of these industries as a percentage of the total economy is expanding; in some cases, what were once thought of as niche or "cottage" industries now out produce (in monetary terms) other previously important sectors in the economy. There is a high level of entrepreneurship in these industries, as well as high participation of contingent workers.

Although both ICT and CI have emerged as powerful sectors, one element that is remarkable is the bottom up development of both sectors (though often predicated upon long or significant investments in research and development in related activities). In 2011 the Netherlands, identified the Creative Industries as one of its nine top sector. ICT was also represented, but in a cross sector approach – represented as part of the Logistics sector and to a degree, the High Tech Material and Systems sector (and embedded as support activities in other sectors as well. The Creative Industries, as currently defined, along with Logistics, are among the *least* R&D intensive sectors, in comparison to the resulting revenue output generated when measured as a percentage of GNP [7].

An Amsterdam developer I interviewed echoes Richard Florida in saying “When you are able to capture the creative people, they will do the rest to make the city an interesting and inspiring place for the mainstream” [8]. Certainly, the manifestation of human creativity is an essential role that cities play. Cities are our common platform. But it should be recognized that as technical work is increasingly dependent upon creative skills and creative work increasingly relies on sophisticated technology for design, production, management and distribution, the distinction between creative and technical work is becoming more blurred. Rather than emphasize the distinction among these endeavors, perhaps from an economic development policy and place cultivation standpoint, it may be more beneficial to examine conditions in which diverse activities are successfully interwoven. This in turn places emphasis on considering how the inherent qualities of a city best match to a certain profile of activities and meet the real demands of its actual constituency, rather than a stylized set of conditions associated with entrepreneurship and innovation that few cities possess, or have the capacity to construct in full.

1.3 Research Questions and Research Design

In my forthcoming dissertation (2013), I use GIS to map and analyze firm attribute data and qualitative location data about workers participating in the information and communication technology (ICT) and the creative industries (CI) in three historic maritime cities: Venice, Amsterdam and Boston. Data collected through interviews of firm representatives and other knowledge holders provides invaluable insight about work practices and perceptions of the value of the built environment.

I consider, specifically: *Do the qualities of historic urban environments matter to skilled workers in 21st century industries? If so, why?* My hypothesis is that historic urban environments are important because they readily possess a set of qualities that makes them *place knowledge* intensive and that provides the necessary conditions for workers to self-optimize. This is predicated on the idea that cities play three timeless and interrelated roles: as repositories of knowledge, as frameworks for creative thinking and new knowledge production, and as settings for the construction of robust social relationships through which information and knowledge are transmitted effectively.

I investigate this by considering: 1) what types of firms (and workers) are locating within historic urban environments 2) whether it possible to observe evidence that *certain types of firms (ICT and CI)* are disproportionately choosing these environments 3) what qualities of the built environment are most important as reflected in location choice 4) how these qualities are perceived by firm representatives to impact their productivity and 5) constructive ways to describe these environments not only as spatial locations, but also as distinct places with specific knowledge-related performance attributes. This paper focuses on findings from Amsterdam in relationship to the later three questions.

2. Preliminary Findings

Below, I report on some preliminary findings from my initial fieldwork in Amsterdam that has been corroborated to a limited degree with fieldwork in Venice and Boston. As I continue to analyze data, these findings will be revised and/or refined as needed.

2.1 Preferences for Certain Qualities

By analyzing data obtained from initial interviews undertaken in Amsterdam (2012 - present) and triangulating this data with data obtained from documents (firm web sites, as well as other planning and real estate market documents) and formal databases, I have constructed a picture of qualities most important to workers interviewed as well a set of location typologies in relationship to the characteristics of observed firms. These describe worker-environment relationships. I will expand upon these and incorporate specific examples as I continue to formally code interview data.

References to quality of place at the scale of the workplace location or building scale include:

Natural light. Workers referenced natural light with great consistency when describing why they chose a specific location. Interior office configurations I observed usually directly reflect preferences for working in areas with natural light. It is perhaps no surprise that this was a near universally mentioned condition, but it is important to emphasize that it is one that many (though not all) Modern buildings do not consistently provide. (Natural ventilation also mentioned.) As such, this is an important differentiation to consider in analysis of building by typology and era and it suggests specific alterations / strategies for adaptive use if buildings are to be retrofitted in ways that will be appealing to these workers (see Figure 1).

Fig. 1: People's Playground is bathed in natural light and takes advantage of the raw, but warm character of the space it occupies.

Raw / soul / texture / warm. Many workers expressed that they like that the buildings they occupy possess a raw quality, lending a sense of informality as well evidence of the past use of the building and the structural materiality of the building. This was often described in contrast to “slick” or “cold” corporate office environments. An Amsterdam-based real estate developer provided this insight:

Appreciation of the “raw” is not just a trend in this market; it is basically a counter trend of the overkill in design in the past years.... Nowadays, people tend to appreciate more straight forward, simplicity, re-use of materials, and authenticity. This need has been reflected in new style in architecture and design, more raw.... Some creative people prefer to be in raw places, other creative people tend to stay in more designed places, as long as they are authentic. Creative people hate fake and superficial [9].

References to quality of place at the building or district (and sometimes the city) include:

Inspiration. Many workers interviewed made references to the importance of environment in providing inspiration for new ideas or solutions to a particular problem. This suggests a high level of environmental sensitivity and sensory engagement (sight, sounds, smell, touch, taste). Often when the importance of beauty (in architecture or the cityscape at large) was mentioned, it was in the context of inspiration, as a launching point for ideas. The value of beauty in this context is linked to production rather than consumption (see Figure 2).

Dynamic. Workers often stated that they like to be located in an environment that conveys a sense of change. They made reference not just to cyclical activities in urban environments, especially those that support a mix of uses, but also to ideas of contrast, juxtaposition and continuity, such as when a new business opens in a very old building. Others also mentioned liking to be among different people, or “a different combination” of people in the urban landscape.

Convenient. Convenience was usually described as the relationship between the home and the workplace, and often, close proximity between a work location and a childcare location; being close to shops and services was mentioned as well. Both travel time and modes of travel were referenced in this context. Workers also talked about the importance of access to parks and water for activities of repose, exercise, socialization, and contact with nature.

The heritage of these cities is an important part of what makes them inspiring, and heritage is also a major factor in their being dynamic places from a development standpoint (and here it is important to point out that heritage management policy differs significantly among the three cities in this study). “Convenience” offered by historic urban environments within maritime cities is often highly linked to centrality; more often than not the historic environment is the “historic center,” from which the city grew overtime. Pre-modern maritime cities are dense, mixed-use and multi-modal in nature (relying on both water-base and land-based forms of transit, often still favoring the pedestrian over the

automobile). All three cities in this study retain such form to a large degree, even as some buildings and subdistricts have been changed over time.

Fig. 2: Qualities at the district level include an inspiring environment in which to work, a sense of dynamism (especially the juxtaposition of old and new) and convenience.

Questions do arise about convenience as it relates to live-work proximity (affordable housing). Additionally, for some entrepreneurs, proximity not only to childcare, but also to schools is critical. Convenience reflects both preferences in lifestyle as well as needs associated with particular life stages. Hence, it is important to examine the demographics of each city and to consider the degree to which each is successful at optimizing the productivity of young skilled workers (more flexible in location choices, but often with less income), mid-stage skilled workers (child rearing age, with more specific needs) and mature skilled workers (who more income, but often less willingness to be flexible). What makes a city well suited to young skilled workers is not the same set of conditions that enables them to retain workers at each life stage, and yet much of the prevailing narratives about innovation focus on the early stage entrepreneurs and skilled workers [10]. Given the importance of multi-generational connections to the integrity of entrepreneurial communities (where mentors foster up and comers, for instance), it is exceedingly important that cities do what they can set the stage for optimization (and worker retention) at each life stage.

2.2 Location Typologies

Several variations of location preference trends appear to be emerging, based upon not only the type of work (as interpreted by industry code) but also size of firm, age of firm, and age of the individual workers interviewed, all of which impact location choice and how firms rely upon the built environment. As a descriptive strategy, I have developed six typologies of the firm-location, or worker-location relationship. I see these as components of the larger knowledge ecosystem. Drawing literally upon the metaphor of an oceanic ecosystem, I assigned a descriptor to each typology:

Type 1: For truly mobile workers, the entire city is their workplace, but they can often be found attached to high quality interior environments (offering free power sources and free wifi) where they pay no rent. Thus, they are like *remora* (*suckerfish*) (see Figure 3). These are the workers who camp out at the Starbucks flagship location in Amsterdam, Two for Joy Coffee or the state of the art Amsterdam Public Library. Although they pay no rent, they do buy expensive coffee and seem to be willing to pay more in housing costs to be proximate to these locations. They may even have an office, but choose not to work there or to do a certain amount of work from these “third places” [11]. One day I was working from Two for Joy Coffee and watched and listened as an English-speaking art director conducted an interview with a potential employee, checked her email, met with colleagues, and then held a conference call via skype, all while her dachshund sat at her feet. This may not be the most efficient way to work (there is no guarantee of a table and there is nowhere to store your stuff), but at least some of the time, those are conditions that these workers are willing to tolerate.

These mobile workers play an important role in emergent innovation ecosystems: their fluid locations aids in the transfer of tacit knowledge within their community of practice; they give a “face” to the community of ICT and CI workers affirming their presence to others; they also interface with the

broader community of residents and visitors, activating the urban landscape while creating a consistent demand for local services.

Fig. 3: In Amsterdam, locations such as Coffee Company and Starbucks serve as “third places” that have become preferred workplaces for freelance workers and others fitting the *remora* typology.

Type 2: Firms that can be described as *hermit crabs* rely on small, formerly discarded shells of buildings or undervalued portions of buildings (see Figure 4). These are the firms willing to fill the nooks and crannies of centrally located real estate that may be substandard in some way (such as basement level locations) while offering other advantages, conveniences and qualities when observed at the building and district scale. While firms might make improvements to these spaces, they usually maintain a raw character; this seems to reflect both what it is that firms do as well as the life stage of the company. When hermit crabs outgrow their current space, they often relocate to a larger space within the same general district. As such, they may play an important role by maximizing the productive value of existing real estate.

Fig. 4: Ebuilders, a web-design firm located in a former print shop in the Amsterdam Centrum fits the *hermit crab* typology.

The next three typologies reflect the emergence of new real estate service models:

Type 3: The third group of firms can be described as *coral fish* drawn to an artificial coral reef (see Figure 5). This analogy is based upon the practice of sinking decommissioned ships to encourage the growth of new coral reefs (for diving sites, etc.). Like coral fish, firms attracted to such sites take

advantage of a programmatic amenity not previously available in the larger environment. In the case of Amsterdam, a number of centrally located large historic buildings (often early 20th century office buildings) have been minimally adapted (the addition of transparent partitions, high speed internet capacity and a beer brewer in the basement) to attract and accommodate firms, sometimes intentionally within one industry and sometimes intentionally heterogeneous. These may be conceived as accelerators or simply as co-working spaces. Firms occupy fixed space based upon short-term rents (often month to month); sometimes tenants may be allowed to share or sublet their space. The architecture of these buildings usually offers notable street presence, sound structure and some shared amenities (such as a roof deck or event room). The firms seeking these spaces are often looking to be a part of a startup community; in some cases venture capital firms operate, support or reside within these locations.

Fig. 5: Smart.pr epitomizes the *coral fish* typology. They rents space on a month-to-month basis at 75 Rokin, a multi-tenant site on one Amsterdam's most well known streets. It has been retrofitted by removal of most interior finishes.

Type 4: *Sharks* are aggressive startup firms for which task-oriented workspace (but not appearance) is paramount (see Figure 6). These are often exit plan-oriented firms; environments they choose are meant to be temporary because these firms see themselves as constantly in motion. They may inhabit the same space as *coral fish*, or other locations available for short-term lease. *Sharks* value the qualities of their district environments sometimes far more than their primary work space, especially as these districts provide the common meeting places where industry knowledge is shared and professional relationships, including access to venture capital ("food"), are forged.

Fig. 6: Wercker, is a venture capital funded startup that enables cloud-based code sharing and testing; it illustrates the *shark* typology. It is one of many firms renting on a short-term basis in the Duintjers CS site, a late

modernist (1973) former bank building in the Centrum, converted to a co-working site in the mid 2000s. Success in accommodating small firms has led to redevelopment interest; soon this “innovation ecosystem” will be disbanded so that redevelopment of the building can take place, illustrating a potential conflict between innovation policy and real estate development objectives.

Type 5: *Sea Turtles* are similar to the firms described as coral fish, with the noted difference that they possess strong preferences for high quality (high design) interior environments in iconic buildings at notable street addresses (see Figure 7). *Sea Turtles* are long-living and to a degree, slower moving. The model that makes this typology possible is based upon a real estate development and management strategy that provides a mix of high quality on-demand task-oriented workplaces and the services to support them. Established, global companies (such as Google) that desire to have a presence in Amsterdam rent limited fixed space on an annual or monthly basis and pay on a user or member basis to gain access to specific resources. This shared-resource model bears some similarity to new models of car sharing and bike sharing. Another variant of *sea turtles* is the contingent worker who chooses these high quality environments as a permanent home, even as he/she changes companies or consulting jobs, and startups (such as public relations firms) for which prestige factor is particularly valued.

Fig. 7: Strategy Plus (formerly DEGW and acquired by the AECOM) uses the co-working site, Spaces, as their Amsterdam outpost. While not a startup by definition, it typifies the *sea turtle* typology, having chosen deliberately to locate on a long term basis within a co-working environment offering a spectrum of task-based programmatic amenities and high quality, warm and light filled interior architecture.

Type 6: *Whales* are large, successful firms (and sometimes, not-for-profits), some of which may have started as hermit crabs, which occupy an entire architecturally notable building (or a large portion of it) at a prestige address (see Figure 8). Locations include major sites within Amsterdam’s Canal Ring, Venice’s Grand Canal or Boston’s Waterfront/Financial District. Often firms (or the real estate development team with whom they closely work) preserve or restore key architectural features while adapting interior configuration to support high programmatic flexibility and/or task-based workspaces. This results in an architectural program that is often far less hierarchical than the original programmatic use of these buildings.

This type of adaptive use affirms the firm’s rise to prominence and their contribution to the urban narrative. Examples in Amsterdam include Guerilla Games, Booking.com and Tommy Hilfiger, and in the non-profit sector, Amnesty International. When demand for space exceeds their current space; *Whales* often choose to acquire additional buildings (satellite locations) in close proximity to the flagship building rather than relocating. As a result these locations can be described as particularly *sticky* [12].

Fig. 8. Guerilla Games, an Amsterdam-based gaming company that now operates as a subsidiary of Sony, occupies part of a redeveloped building in the Canal Ring. Employing more than 120 persons, the firm epitomizes the *whale* typology; it was deliberate in its choice of a central location and a highly adaptable landmark building.

2.3 Relationships among typologies

First, not surprisingly, among these typologies it is possible to observe generally an inverse relationship between the size of firm and permanence of location. Second, it is possible to observe clear symbiotic relationships between certain typologies, and possible, among all typologies. For instance, *remora* (and particularly the freelance worker element of this typology) not only move between locations, but also between projects and companies. As such they contribute greatly to the recombinant quality of the innovation ecosystem. They are a natural complement to both the *whale* and the *shark* typologies. Within the numerous co-working sites found in Amsterdam, it is often possible to observe a range of typologies; it may in fact hold true that diversity (both in typology) as well as within industry focus may in fact be one indicator of robustness. Third, firms vary in their degree of vulnerability to location displacement. Firms (including sole proprietors/freelancers) that can be described as “*Remora*” are knowingly vulnerable and prepared to move, but they easily latch on to other sites, whereas *whales*, and to some degree, *sea turtles*, have secured their position by demonstrating willingness to pay for critical resources. The perceived and likely very real advantage of many co-working sites – the option to rent month to month – appears to be most attractive to three of the six identified typologies – *coral fish*, *turtles* and *sharks*. As such, it is the firms that fit these typologies that are also most vulnerable in a “hot” real estate development cycle, with the paradox being that a key driver of development interest – emergent innovative firms – may find themselves soon priced out of the market.

Relative programmatic diversity is an important differentiator among these typologies and the building, district and city scales are all implicated. *Remora* can be considered spatially “a programmatic” in that they do not possess inherent programmatic qualities, though they show themselves to prefer what are classically defined as “third places” as mentioned above. The work spaces created by *hermit crabs* is often very programmatically limited. Offices rarely include formal reception spaces and may include only nominal support functions (such as a coffee bar); *hermit crabs*, too, rely greatly on “third places” of the city and in doing so, fortify the weak but important ties within their social networks [13]. Firms found in co-working sites, including *coral fish*, *sea turtles* and *sharks* typologies, are often attracted to such sites due in part to the spectrum of task-oriented workspaces (and support services) they offer. These communal assets are a key driver of knowledge sharing and collaboration that takes places *within* such locations, but importantly, co-working sites tend to be highly permeable. As such, they may be particularly effect in promoting knowledge transfer both within and outside their walls. Finally, *whales* tend to develop as the most internally programmatic complex sites, providing a range of amenities (task oriented work spaces, catered and self-catered kitchens, gyms, theaters, gardens, and massage rooms, to name a few examples) that bears some resemblances to closed campus models of headquarters found in suburban settings. Such investments are intended to attract and retain workers, and importantly, to enhance the productivity of workers – both in individual and group work. In offering such sophisticated internal programming, they set the stage for very different relationships between their workers and activities taking place at the district level. As such, *whales* risk creating a situation where they are proximate to knowledge flows but not directly involved in them.

3. Conclusions

In this paper, I introduce a new method for considering the value of cultural heritage and the historic built environment in relationship to productivity in the 21st century. Findings reframe conceptual understanding of adaptive use, producing new implications for urban policy and regeneration strategies, both in the cities being studied and in the broader context of urban development. They shed some light on what is actually taking place in the process of adaptive use, one of the most resource-efficient strategies for city making from both upfront capital cost and long term strategic investment perspectives.

While it is too early in the research process to determine precise implications, these preliminary findings raise important questions about how existing knowledge is transferred and new knowledge is generated and they suggest that the quality of place, informed by physical attributes, communicative value and social function, plays a substantial role. Rather than focusing merely on physical conservation, this suggests that sustaining cultural heritage is a matter of understanding timeless human needs in a rapidly changing context.

The development of specific location typologies argues for more holistic approaches to urban sustainability, in which cultural, economic and environmental issues are seen as interrelated. In particular, this research demonstrates the specific role of culture in generating conditions as well as behavioral mechanisms that influence location choice. These choices are important, not only because they impact the use and value of the built environment, but also as the building blocks of capacity for individuals to engage creatively and innovatively in the solving of complex problems.

‘The Fragile Ecosystems of Memory’: Literary House Museums in New Zealand

Elizabeth AITKEN ROSE

School of Architecture and Planning, National Institute of Creative Arts and Industries, The University of Auckland, Auckland, New Zealand
e.aitken-rose@auckland.ac.nz

Abstract

Literary heritage has many facets, with texts and writers at its core. More generally it includes the infrastructure preserving texts and sites associated with writers. This paper focuses on literary house museums and the role of physical artifacts and community networks play in nurturing cultural memory. Appreciation of literary houses as significant cultural and economic assets expanded internationally in the twentieth century. Today there are agencies protecting and promoting sites with associated scholarship. Literary houses have idiosyncrasies, but also commonalities with other forms of tangible heritage and wider debates around relevance, preservation and tourism. The major issues are investigated through case studies of New Zealand’s leading literary house museums. These explore the creation, conservation and value of literary houses; and their private, public and legal support. They highlight the complications of heritage, evolving webs of significance and its material and political vulnerability. While writers might prefer to be remembered for their literature, their houses perpetuate reputations and provide a conduit to new audiences. Houses, often perverse and peculiar, offer narratives of personalities, place and history. All of New Zealand’s literary houses have led to the preservation of unexceptional sites, but values revise over time. They now offer insights into ‘ordinary’ architectural history and urban development, becoming inadvertent catalysts for broader reflections on evolving social history, cultural identity and heritage values.

Keywords: New Zealand; Literary House Museums.

1. Introduction

New Zealand novelist Peter Wells¹ observes that in his country “The fragile ecosystem of memory vibrates like a cobweb trembling during a downpour”. This poetic allusion to the complexity of the past and its intense vulnerability in the present and future is the subject of this paper. It emphasises the literary house museum as a medium for exploring heritage and, in particular, the socio-economic processes and networks that nurture it. The ‘softer’ dimensions of heritage are often ignored in New Zealand heritage policy discourse, where public authorities privilege the registration, regulation and professional conservation of the physical artefact. Yet the sustainability of the communities of interest supporting built heritage may be the most important factor in securing its longevity. These issues are investigated through case studies of three of New Zealand’s leading literary house museums: the Frank Sargeson House (Auckland), the Katherine Mansfield Birthplace (Wellington), the Ngaio Marsh House (Christchurch) and the Janet Frame House (Oamaru). They draw critically on archival materials, policies and plans complemented by qualitative interviews with stakeholders. The paper begins with an exploration of literary heritage and its museums internationally.

2. Literary Heritage, Tourism and Houses

Literary heritage is multifaceted. Texts and writers are its heartland. Beyond, it includes the infrastructure supporting, promoting and preserving texts (publishing houses, libraries, archives, and literary canons) and the sites associated with writers (houses, workplaces, graves and memorials). It has its own cultural landscapes (places and topographies inspiring literature or animated by it) and

includes trails and events celebrating literary works and personalities. In principle literary heritage, like art, is underpinned by intrinsic values. In practice it often requires paying visitors to ensure its survival.

Literary tourism – journeys inspired by writers' lives or work – often makes literary heritage viable and is increasingly packaged as a collection of destinations or 'branded' landscapes by local authorities, tourist boards and entrepreneurs. It began with the Greeks, but is usually traced back to the aristocratic Grand Tours around Western Europe in the eighteenth century, developing commercially in nineteenth century Britain and America with the growth of literacy and improvements in transport. It accelerated in the twentieth century with globalisation, growth of travel writing and screen adaptations of classic and popular works. The literature-tourism relationship becomes more complex in the late twentieth century. The original text diminishes in relevance as non-readers and tourists encounter literature through film, merchandise, festivals, theme parks, tours and museums². Film, in particular, contributes new meanings, metaphors and fantasies, turning space into place, and travellers (often unacquainted with the literature itself) have become more interested film locations than fictive settings.

Literary houses, with some exceptions, focus on an individual writer. Appreciation of them as significant cultural and tourism assets expanded in Europe, North America and Russia during the twentieth century and today there are a number of agencies protecting and promoting sites, scholarship and networking³. There are more than 200 houses in France – many in public ownership (usually the municipality), unlike Britain and America where most are privately owned, generally by non-profit trusts and societies. Given there were 145 places dedicated to memorialising writers in all of Europe in 1972 France alone indicates significant expansion⁴.

They are curiosities. A writer surely would wish to be remembered for literature. Yet books alone seem insufficient. Readers, writers, tourists and citizens are "randy for relics"⁵, even those of dubious authenticity. Shakespeare's birthplace, for instance, whilst there is evidence his father owned it and daughter inherited it, the Bard's connection remains speculative. Nonetheless, in 1900 it attracted 30,000 visitors and over 300,000 in 2005⁶. According to Robinson and Andersen⁷ literary houses are the most important literary tourism resource, appealing to a range of markets "as focal destinations [...] (providing) tangible connections between the created and the creator, allowing tourists to engage in a variety of emotional experiences and activities." The house (and sometimes its environs) becomes another form of text to be read by the visitor – with elements selected, ordered and interpreted to tell a particular story about an author and sometimes other stories about the author's milieu, legacy, or literature and heritage generally. These stories alter over time, responding to new audiences, museum practices, owners' tastes and evolving cultural contexts⁸. Likewise the houses evolve, physical integrity eroded by routine maintenance, conservation and curatorial practices.

The writer's imprint varies – some were created and decorated by the occupant and can be read as another form of creative expression alternative to the texts, or as a material biographical expression of social status, aspiration or gendered stances; others are shaped by cultural processes after the writer's death. Hendrix⁹ explores the evolution of a writer's house from individual to collective memory through European case studies. He observes that the writer's reputation is critical in the development and survival of the house. The special appeal of literary house, beyond other forms of personality related heritage, lies in the fusion of fact and fiction. Visitors communicate with writers through their most intimate spaces and objects, and engage their own creativity. Houses become springboards for new imaginings and remembrances in ways not roused by elite heritage possessing high architectural values. Hendrix and Watson¹⁰ attribute the growing popularity of literary houses in the nineteenth century to a number of factors: the yearning for a physical connection with history, rise in romanticism, preoccupation with genius and emerging cultural nationalism.

The fusing of fact and fiction is multidimensional. When the house becomes a museum and part of collective cultural memory new stories evolve. There is considerable variation in the preservation and staging of literary homes. Robinson and Andersen¹¹ observe that fashions in presentation have shifted from formalized display cases to stage-managed ambiances – suggesting the writer has merely stepped out for a moment. An illusion as the writer is usually dead – a prerequisite for memorialisation and conducive to expanding the tourism offer. The 'genius loci' of genius and the objects associated with creative practice fascinate. The writer's desk has special significance, as do books, typewriters and pens.

Lavishly illustrated coffee table texts on writers' houses usually promote them as mediums for communing with authors¹². In Marsh's¹³ more substantial work she values the knowledge writers' houses add to understanding a writer in their environmental and historical contexts and observes that while some might survive for their architectural values or magnificent gardens, most of the ordinary places would not have endured or be publicly accessible but for their literary inhabitants. Literary

houses perpetuate fragments of townscape and records of social, technological and urban change that might otherwise have been overlooked in portfolios privileging aesthetics.

Literary houses are peculiar, ambiguous and often inconvenient. Literature, not architecture or location, make the place and inhabitant important. Here built heritage comes alive within a broader cultural ambience, yet it is often heritage of a quotidian nature. Writers are usually poor and their residences are not always located in beguiling neighbourhoods or on popular tourist circuits.

3. Management of Literary Houses

Research on the management of literary heritage properties is limited. Smith¹⁴ focussed on the role and motivations of volunteers in UK literary museums. Volunteers are critical to their operation and engage for a variety of reasons: they have the time; enjoy social interaction; gain skills and experience; and/or have a particular interest in the property, author, local history, architecture or literature. This appears to be true of British museums in general, although the significance of volunteering is largely unappreciated or well researched. Museums are almost invariably founded by volunteers who continue to play an important, if not essential role in their operation and longevity – with subject interest and social relationships being the key motivations¹⁵. Orr notes that volunteers undertake governance, management and various tasks including conservation, research, documentation, exhibitions, interpretation, security, marketing, fundraising and administration: “Without volunteers many museums would struggle to function or, in the case of those dependent entirely on volunteers, would cease to operate altogether”¹⁶. Britain’s *National Trust* operated with the support of 55,000 volunteers in 2009, contributing an estimated 3.1 million hours, valued at £25 million¹⁷.

The institutionally fragmented governance and management of literary house museums in the USA contrasts with apparent stability afforded by umbrella organisations such as the UK’s *National Trust*. The *Literary Landmarks Association* (formed in 1986) dedicates sites and supplies plaques for a fee, but its mission is advocacy, not material support. Most are under the care of private foundations and perennially challenged by maintenance and development costs, particularly given variable visitor numbers. High profile sites, notably the Mark Twain and Edith Wharton houses, have faced foreclosure. House museums, per se, are popular in the USA, but highly problematic unless well valued by their communities and managed by skilful and strategic boards¹⁸. They are products of the cultural, social and political circumstances in which they are founded, often by people with limited understanding of the realities of actually running them and survive only if they receive substantial funding and remain relevant in the evolving present. Harris¹⁹ makes a case for the ‘de-museumification’ of those most at risk, arguing that buildings stand a better chance of long term preservation if they shift back into individual ownership with appropriate conservation safeguards; or reprogrammed for other uses, such as study; or merged or co-operatively run with other like-minded institutions.

4. New Zealand’s Literary House Museums and Heritage Framework

New Zealand’s literary heritage is comparatively young and its house museums a small but expanding niche. All have been local private initiatives, where the motivation has been to celebrate New Zealand literature and cultural identity. In this respect they echo arguments elsewhere that heritage is a cultural process²⁰ and for local people “a social process rather than the physical object to be preserved”²¹.

New Zealand literary house scholarship is modest and emphasises literary and marketing perspectives. McLachlan²² investigates how they operate beyond and outside fictional texts, although these remain the only genuine and inherently meaningful artefacts left by their absent writers. He argues that these sites are created by ‘sociable readers’, for whom literary texts are of secondary importance; and like Hendrix contends that they essentially reflect the communities creating them and not the individual they honour. Thyne et al.²³ focus on visitor experiences. Although different in disciplinary orientation, this research also supports the sociability of such sites – where subjects, objects, and mythologies kindle visitors’

Fig. 1: Locations of New Zealand’s Literary Houses

emotional engagement with writers and wider literary community. They may contribute little to visitors' understanding and interpretation of writers' texts, but visitor interviews indicate they promote interest in the writer's work – as well as New Zealand literature and heritage generally. Collectively this work illustrates the intricacies of heritage sites, particularly those memorialising an individual – in this case individuals who are not just writers but figures embedded in dense cultural tissue, mediated by the time-frozen spaces they once inhabited and the successive communities attending them – who ascribe (and receive) their own multifarious meanings.

The following explores the instigators and guardians of New Zealand's leading literary house museums. Before turning to these it is useful to have a brief understanding of the country's statutory heritage framework. The New Zealand Historic Places Trust (NZHPT) (established in the 1950s) is an 'arms length' Crown Entity maintaining a national system of registration of historic places and sites. Its property portfolio is minimal and funding compromised; its role is primarily advocacy and advice. Territorial authorities deliver heritage regulation under the mandate of the Resource Management Act 1991 (RMA). Local councils maintain independent heritage schedules. The focus of the professional heritage management authorities is on the physical artifact and its preservation. Criteria for registration are predefined and traditionally grounded in architectural and/or historical significance, although other values such as social, cultural and technological are now taken into account. Funding for heritage is limited – the NZHPT, National Lotteries Commission, community trusts and some councils provide heritage grants. Councils may also offer property tax remissions etc.

4.1 The Frank Sargeson House

Frank Sargeson (1903-1982) was recognised as New Zealand's leading literary nationalist in the 1940s and later admired as a literary mentor. His house on Auckland's North Shore is possibly the only "fibrolite literary memorial in the world"²⁴. Moving to the area in 1929 after a humiliating conviction for homosexuality, he lived initially in a decaying family bach (seaside weekend cottage) until the local council ordered its demolition. Plans for a new bach drawn up by a friend (and noted vernacular architect) proved too expensive and another friend, a Hungarian émigré

Fig. 2: The Frank Sargeson House, Auckland. E. Aitken Rose

builder, constructed a pared-down version at cost. In 1948 Sargeson moved into the simple three-roomed house, living there until his death in 1982, supported by vegetables he grew in his garden, various pensions and sporadic royalties. The Council granted him permission to erect an old army hut on the back of the section solely for storage. It housed his friends and protégées until it was invaded by rats and demolished in the 1960s. Using a legacy, Sargeson added another room and verandah to the bach for long-time friend Harry Doyle in 1967. The North Shore morphed into bungaloid suburbia following the construction of the Auckland Harbour Bridge (1959). Sargeson's unsealed cul-de-sac became a main route to the Bridge, increasing traffic volume destroying his tranquillity and the arts bohemian community attracted to the Shore by cheap rents, and quirky informality. Sargeson's health deteriorated towards the end of his life and the famed vegetable patch turned into wilderness.

When he died neighbours called for the bach to be razed, but his heir and literary executor, Christine Cole Catley, gathered the friends who had relished his hospitality to form a trust and preserve it as a literary museum. Set up in 1983, with pro bono legal assistance, the Frank Sargeson Trust initially had five trustees: prominent writers, journalists and an architect. Cole Catley transferred his modest savings, royalties, house and quarter-acre section to the Trust. 'Friends of the Sargeson House' (an ephemeral ensemble of writers, academics, teachers and local citizens) tidied the site, re-roofed the house and sorted through his voluminous books. The house was arranged with "judicious fakery" to resemble its mid-sixties state when Sargeson was deemed to be at the height of his powers²⁵. The vegetable patch was not restored, but the garden cleared to "assume the appearance of a carefully structured wilderness" and fenced with the help of periodic detentions labour²⁶. Trustees sprinkled

Sargeson's ashes in his front garden without religious ceremony, as he instructed. His most valuable books and papers were sold, but much memorabilia remained in the house. The house is often referred to as a 'shrine', albeit 'improbable', curious, depressing, and even perverse²⁷. Sanctity was sacrificed with the sale of the back garden and progressive widening of the street. The subdivision was necessary to raise funds to attract government subsidies essential to launch the residential fellowship established in a central Auckland heritage building.

Sargeson continued to have a hostile relationship with the local council after his death. Neighbours protested that the bach was a monstrosity at the subdivision hearings and full rates remission commensurate with its museum status was hard won. Its heritage value was officially acknowledged when the house was listed in Council's District Plan (land use plan) 1998 and given the highest classification recognising its significance beyond the locality and protecting the exterior, interior and site. The City Planner made it clear that this was not for its architectural value. Road-widening threatened to shear five metres off Sargeson's front garden in 2001 and over several years the Trust negotiated with Council engineers to reduce this - elaborating on its original 'significance' story at the designation hearing to embrace its spiritual and social history dimensions, along with tourist potential²⁸. Independent Commissioners subsequently upheld the site's 'high cultural significance' and only a metre of the site was conceded.

Although approached, the NZHPT showed no interest in scheduling the house at the time of Sargeson's death. This position conspicuously reversed in 2004, following an application by architects working on a voluntary basis, when it was given the highest status (Category 1²⁹) and registered as "a key asset in New Zealand's cultural identity"³⁰. Many of the factors identified by the Trust in unflinching advocacy over the years were recognised in the NZHPT's significance analysis. Although the first of New Zealand's literary house museums and arguably its most authentic, it is, along with the Marsh House, the least professionally and developed. Upkeep of the house has been supplied through voluntary effort. The Trust secured grants for a conservation plan in 2007 and a substantial grant in 2009 from the Council was used to undertake critical maintenance and upgrade fire protection and security.

Considerable voluntary time and effort has gone into meeting the challenging demands of grant writing and reporting. Heritage grants generally cover partial costs – either involving stitching together a raft of applications, or a call on the Trust's reserves. Heritage status, while improving grant credibility, imposes potential costs on owners. Anything more than routine maintenance may require a resource consent (some local councils offer remission) and a building consent. The Sargeson Trust, for instance, had to pay for a building consent for the installation of a fire protection system – considered the highest priority in the conservation plan and endorsed by the Council and NZHPT.

Funding for a curator and/or administrator to assist with planning, fundraising and making the house more publicly accessible has yet to be secured. Of even greater importance is the need for ongoing conservation expertise, which cannot be addressed through well-meaning voluntary effort. Conservation is a process not amenable to periodic project funding. If the Sargeson house is to survive it requires consistent professional oversight and continuous implementation of a maintenance schedule, along with regular monitoring. This is particularly acute with respect to the chattels. A 2010 survey³¹ commissioned by the Trust indicated 14% of the artefacts had deteriorated beyond repair, with a further 14% requiring urgent attention. While visitors enjoy the closeness and immediacy offered, relics are susceptible to deterioration through human contact and theft.

There is also an inherent conflict in its use as a "lively meeting place" and museum reflective of a particular period. For trustees who knew Sargeson it remains 'Frank's place' and the disciplines of conservation complicate their attachment to his 'atmosphere'. As most are writers (and heritage amateurs at best) they find it difficult to comprehend the need for conservation plans – and some bitterly observing that professional heritage services cost more than they earn in a year, or Sargeson over a lifetime. As Sargeson's trustee friends' age, the need for a more professional approach to running the house becomes paramount – if it is to be appropriately interpreted when they are no longer available to bring it to life.

Apart from grants, the house is supported from the Trust's small capital base, an itinerant Friends network, limited sponsorship and donations. Its parallel commitment to residential writing fellowships, including the operation of another heritage property further stretches resources. Unless the Trust receives significant public funding or philanthropy, it will never be able to retrieve the back section, yet its loss has de-contextualised the house, which no longer affords the sequestered productive verdure that was much part of Sargeson's mental and practical topography. Lack of space also restricts tourist development. The house is too small to provide proper facilities for administration, education and

merchandising – and Sargeson's poverty is hard to sell. The house is open by appointment and during heritage weeks, and relies on strong linkages with the local Library. Formal statistics are not kept, but visitors are estimated to be around 400 a year. There is no entry fee, nor merchandising. Much of its charm lies in the absence of roped-off spaces and formal displays – offering the visitor intimate communion with Sargeson's meagre relics. Interpretation is still supplied by his friends and knowledgeable librarians.

It is as much a monument to those who create cultural memory in New Zealand, as it is to a writer and era. As is often the case in New Zealand, local government and NZHPT played a reactive role, responding to the passion and fidelity of local idealists by eventually conferring the legitimacy of statutory protection. Particularly compelling in this case is the shift in attitude and values across the decades, where a building treasured by a few evolves into a site of national significance with multiple meanings. The Sargeson House's survival still relies on volunteers and their capacity to navigate bureaucratic process to achieve competitive, often parsimonious, conservation grants, let alone safeguard its structure and contents.

4.2 The Katherine Mansfield Birthplace

Katherine Mansfield (1888 – 1923) was New Zealand's first internationally acclaimed writer and a pioneer of modern writing. She lived in Europe in her adulthood, but her most celebrated fiction drew on childhood memory. Her birthplace in Thorndon, Wellington was the least pretentious residence in a series of grander properties owned by her upwardly mobile father, but bourgeois compared to Sargeson's. Her family moved into two-storeyed weatherboard five-bedroomed house in the year of her birth and she lived there for five years. It had many subsequent

Fig 3: The Katherine Mansfield Birthplace, Wellington. E. Aitken Rose

owners, was converted into flats in the 1960s and the fern-filled garden beyond the back garden was dramatically reconfigured with a motorway in the 1970s. Many of the houses Mansfield lived in before her exile abroad succumbed to urban change and the Birthplace was assumed demolished until an accident in street numbering was discovered by Oroya Day, then on the board of the NZHPT. Unlike the Sargeson House, where writers who had personally known the author were instrumental in its preservation, the other houses under consideration were saved by those engaged in some capacity with the NZHPT. Day, an art historian, hastily ensured the Birthplace was registered Category 1 by NZHPT (1986), but the Trust refused to buy it because of the operating costs.

Like Cole Catley, Day had the vision and strength of character to take on the project herself. She had spent time in Britain and appreciated its tourism potential, but primarily wished to symbolically reclaim Mansfield for New Zealand and against competing claims from France and Britain. Adamant that it should not be a shrine, she hoped it would eventually become part of a worldwide network of writers' houses. Day formed the charitable Katherine Mansfield Birthplace Society in 1987 to acquire and preserve the property for the benefit of all New Zealanders, foster an appreciation of Mansfield's works, advance New Zealand literature generally and provide an educational resource and tourist amenity. With NZ\$100,000 apiece from the Ministers of Tourism and Internal Affairs, Department of Tourism and Publicity and Stout Trust, plus a contribution from her own family, the house was purchased later that year. A twelve-member board charged with the following values governs the Society: professionalism, accessibility, community involvement, education (Mansfield and NZ literature), and co-operation (with heritage and cultural tourism agencies)³².

Professionalism has been an abiding ethos from the outset and today it is by far the most sophisticated of the literary museums. This has been underpinned by a pragmatic understanding of the importance of tourism in sustaining this. Initially the Society thought to restore it as a writers' research centre. After an NZHPT archaeological survey uncovered vestiges of the original décor, the

Society decided to refurbish the house reflective of Mansfield's era, based on excavated artefacts, photographs and her literature, in accordance with ICOM OS conservation standards. This decision cost the Society twice as much as the original proposal, despite all the professional assistance being volunteered. Chattels relevant to the period were donated or lent – solicited from the community through a wish list. Volunteers created a 'heritage garden', referencing Mansfield's writing and colonial seed stocks; prisoners constructed the fence. The house opened a century after Mansfield's birth and is a fastidiously restored example of late Victoriana. It contains none of her personal possessions. Those owned by the Society now so fragile and valuable they are stored offsite for security and conservation. The house is staged and non-interactive, with exhibits carefully arranged to suggest real life – minus the occupants – and roped-off from visitors.

Fundraising for the restoration as arduous – with many hours expended on the carefully composed and targeted applications necessary to achieve the many grants required, as most were small³³. Thirteen years into the project with numerous conservation and tourism awards, insufficient revenue remained and issues, even though the Council contributed to operating costs, partially covering the employment of a fulltime administrative director. The Society is acutely aware of the museum's vulnerability to shifts in political priorities (and sensitive to potential equity claims from less favoured cultural and civic institutions). It constantly works towards a diversity of robust revenue streams, but acknowledges the support it has received from the Council has been invaluable in its development and essential to its survival, given that New Zealand does not have a culture of philanthropy and limited central government support for local cultural institutions. Local government is restricted by its traditional property-servicing ethos and ratepayer conservatism. Grant writing continues, limited by the amount of time staff and trustees can devote to it – that these are entailed to capital projects and not running expenses frustrates the Society as much as it does the Sargeson Trust. Additional revenue comes from entry and tour fees, merchandise, Society subscriptions and special project grants. Although not on the central city tourism circuit, the house is accessible to tourists relative to the other literary museums. While every effort is made to maximise visitor attendance, this is ultimately constrained by an ICOM OS recommended maximum of 12,000 (to protect the building's fabric). Insurance is the largest single cost. Using seed capital provided through sales of a popular exhibition it set up The Katherine Mansfield Birthplace Endowment Trust in 2008 to attract bequests.

A lawyer currently chairs the Society's board of ten members (maximum twelve). Shoulder tapping is used to secure particular skill sets and trustees work "in a hands-on manner" on specific projects in addition to governance. Part-time curators and rigorously trained volunteers assist the full-time director. A group of 'honorary advisors' contribute specialist skills and expertise. The house is well networked into the greater cultural tourism offering of Wellington City and is a focus for educational tours on social, historical and technological subjects relating to colonial life. In contrast to the other houses, it maintains a comprehensive and updated website, regular newsletter and educational resources supporting school curricula.

The Birthplace again illustrates how places initially valued by a few can over time, be appreciated by a wider public for richer complexes of significance; and of voluntary effort required to ensure its survival. Leadership is crucial – the founder was adroit at constructing networks of goodwill, expertise and political favour. When she retired the project shifted into another phase. Although professionalised it is still reliant on considerable voluntary effort, much of it highly skilled. It remains vulnerable to shifts in political and economic circumstances and its development is contingent on the quality of its governance. It is hoped that it will eventually be covenanted by the NZHPT to protect it being captured by a 'rogue board'; with its constitution, conservation plan and endowment programme securing it against those who might "highjack the spirit of the place"³⁴. Those who govern and manage the Birthplace see themselves as custodians of the past. The writer "anchors memory"³⁵, with the house retaining historical fragments evolving new meanings and audiences.

4.3 The Ngaio Marsh House

Dame Ngaio Marsh (1895-1982) was both patriot and expatriate, dividing her adult life between England and New Zealand. Internationally acclaimed as a detective fiction writer, she is considered one of the 'Queens of Crime', equal in stature to Agatha Christie. She was New Zealand's first blockbuster novelist, widely translated and is still read today. Her reputation as a writer is stronger abroad than in her native country, where she is better remembered as a theatre director and part of a constellation of Canterbury-based artists credited with the emergence of a national culture. Like Sargeson, she was a generous mentor, especially in the theatre.

When New Zealand Marsh lived in Marton Cottage, Cashmere, Christchurch from the age of ten until her death. Samuel Hurst Seager, a leading Christchurch architect and a relative, designed the original house. A modest dwelling of four rooms, semi-circular open verandah and panelled timber interior of English Arts and Crafts influence, it remained the heart of the building as it was added to over the years. Although not an architectural tour de force, *inter alia*, it tells the commonplace New Zealand narrative of pragmatic extension. The 0.3-hectare property, originally bare hillside, was slowly converted into terraced gardens. Secluded and peaceful, it lies at the end of steep and narrow bush-clad street and driveway.

Fig 4: The Ngaio Marsh House, Christchurch. E. Aitken Rose

Marsh bequeathed the house to a Sydney-based relative, who decided to sell it in 1992. The NZHPT registered the house Category 1 in 1985 and was approached to buy it, but lacked the funds. A group affiliated with the local branch set up The Ngaio Marsh House and Heritage Trust in 1995 to purchase and preserve it. The constitution provides for seven trustees, six appointed by the Board itself and a custodial trustee appointed by the Perpetual Trust. This model, which varies from the governance structures adopted by the other houses, and is intended to ensure enduring succession, provide public accountability and financial probity. A retired lawyer has chaired the Marsh Trust since inception, his interest in the house part of a wider engagement in Christchurch heritage. Over the years the Trust has benefitted greatly through the dedicated energies of retired professionals, along with academics and a local architect. The Trust's constitution states that its purpose is further appreciation and study of Marsh's literary and dramatic accomplishments, but essentially the house is intended to be a symbolic springboard for wide-ranging conversations promoting the region's contribution to national cultural heritage - "valuing and capturing an artistic icon in a country that is mad about sport"³⁶. The house was bought by the Trust with bank loan and second mortgage from the Christchurch City Council. The Council eventually wrote-off this off, but provided little additional support other than partial rates remission and help with landscaping. The mortgage has been increased from time to time to provide for necessary maintenance.

The Marsh House opened to the public in 1996, following protracted negotiations over neighbours' objections to increased traffic. Open only by appointment, it receives around 200 visitors a year, one-third from overseas and mostly women. Revenue comes largely from entry fees, grants, donations and tenanted flat at the rear of the property. A Society of Friends (formed in 1996) fundraises. A small basket of Marsh's crime fiction, audio books and postcards is the extent of the merchandising. The Trust struggles to make ends meet, servicing the loan being the biggest issue, although the Perpetual Trust's administration charges are also considerable. Limited funds restrict publicity: brochures, rudimentary website and networking. Security is provided through an alarm system and the tenanted flat. Essential fire protection has yet to be afforded. The conservation plan was prepared in 1993 by an architect trustee on a voluntary basis. The trustees, many now over eighty years, do the administration, promotion and the garden. They are also the guides, providing interpretation through storytelling. Only one of the current trustees knew Marsh personally and took photos of the house when she died. These were used to reassemble her memorabilia, much of it leased to the Trust on a peppercorn rental by Marsh's relative, to suggest she had just stepped out. Seclusion adds to the House's charm, but its suburban location, restricted easy public transport, precipitous access, fractious neighbours, meagre publicity and entry by appointment limit visitor numbers. Given minimal public assistance, outstanding debt and the costs of maintaining (let alone professionally securing and conserving) an aging property makes financial viability problematic long-term.

Although diversely skilled professionals, the trustees are keenly aware they are merely "amateurs doing their best"³⁷. The leased chattels are a vulnerable to the whim of their owner, now in his

seventies. Trustee succession is a pressing issue as those associated with Marsh and her milieu diminish. It remains to be seen whether newcomers will replenish this trust with the necessary vision, acumen, time and energy to sustain her house in the future. There is a palpable sense of exhaustion and disillusion expressed by some of the trustees, particularly with public bodies responsible for heritage - NZHPT considered excessively bureaucratic, but offering little substantive help. Another complication is the current lack of recognition given to Marsh's literature in New Zealand.

5. Conclusion

Undoubtedly most writers would wish to be remembered for their words and not the ancillary leavings of their lives. One can only speculate on whether Mansfield, Sargeson and Marsh would have appreciated their private domains opening to the public gaze. The Sargeson Trust has been assiduous in keeping its writer's memory alive (and fomenting his mythology) through books, films, his house and a writer's fellowship. Notwithstanding the 'judicious fakery' involved in its restoration, the house (although stripped of its context) undoubtedly offers the most authentic environment. Its scale, accessibility and lack of commercialism give it a coherence, intimacy and appearance of sincerity not fully achieved in the other houses, which dedicate space to administration, education and, in the case of the Mansfield Birthplace, merchandising. While such functions assist in the sustainability of these houses (and add to the offerings) they inevitably interfere with the pretence that the writer has slipped away momentarily. The Sargeson House's authenticity is also a reflection of its rudimentary transition into a museum. If it is to endure trustees will need to find a way of making it more publicly accessible, tap new revenue streams, and provide interpretation not reliant on trustees or the goodwill of the local library, along with introducing conservation practices to preserve its fragile collection. Of the three houses, Marsh's is perhaps the most immediately vulnerable, reliant on its aging trustees for most of its support and operation, while waiting for a resurgence in national interest in her literature. Mansfield continues to have a powerful critical reception, and is well ensconced in educational curricula in New Zealand and abroad. Every opportunity to reference her work is evident in the Birthplace, although direct connections are meagre. Great pride has been taken in its fastidious restoration. Apart from Mansfield's enduring fame and relevance, the Birthplace has been blessed with political support and finance assisting it to operate professionally and creatively, backed by good promotion. It is relatively well positioned as a tourist and educational asset, in a highly literate and prosperous civic setting providing empathetic university and national cultural institutional networks. Ironically, however, for all the attention to historical detail, it is less genuinely the place of the writer than the Marsh and Sargeson Houses.

The audience for highbrow literature is probably relatively rarefied universally and the New Zealand market is small. Trends in book selling, with the rapid circulation of titles, does not favour those published months ago, let historicised fiction. Writers' houses, although themselves appealing to a niche market, can keep names alive and provide a pathway towards the words that matter most to writers. They offer narratives – of personalities, place and history. None of New Zealand's literary houses are architecturally exceptional – but values shift over time and now they comment on social, cultural and urban history. How future visitors (and readers) will respond to them is impossible to predict – intellectual, literary and heritage fashions change, but without the indefatigable efforts of individuals in the present the possibility of any response would be removed. Such individuals work, in the main, voluntarily through charitable organisations, in an environment where sustained public and philanthropic support is modest, variable and highly contestable, even when sites are accorded supreme heritage status. Cultural tourism may be a life line, but development is inhibited by factors such as fragility, scale and inconvenient location, issues troubling literary houses elsewhere. Consistent funding for professional conservation, management and promotion is essential if New Zealand's literary houses are to survive for others to craft new meanings.

Representation and Continuity.

The regeneration of the area, the city and the architecture.

Paolo GIORDANO

Dipartimento di Architettura e Disegno Industriale "Luigi Vanvitelli", Seconda Università degli Studi di Napoli, Italia

E-mail: paolo.giordano@unina2.it

Abstract

The continuity between what was, what is, what will be, is the prelude to any problem that arises, as its goal, the critical representation of a natural or artificial place. The urban sites represent sedimentation and accumulation of continuity transformative - obvious or hidden, present or missing - which, over time, helped to configure the characters identity. The comparison with the specificity of the places, the knowledge of the different sedimentary layers, the recognition of the values of witnesses, the distinction between relevant and irrelevant - to be implemented through the survey and the drawing in a perspective of logical connection between parts missing, existing realities and assumptions modificative - represent the conceptual assumptions for the construction of a new design of continuity. In this sense, a cognitive approach to graphics-based, research-based continuity, it is essential to identify those intonations architectural measures to redefine the lost harmony of the place raped by the consumer society. The town of Acerra, north of Naples, is an urban exemplum of great interest to test the responsiveness of the design with respect to the issue of continuity is due to the characteristics of its Urbis shape - of Roman origin - and because of the presence of an architectural monument, the Castello Baronale, able to enclose itself, evokes, the history of the city of belonging.

Keywords: relief, knowledge, modification

1. Reflections: city and continuity

The continuity between what was, what is and what will be, is the prelude, the necessary introductory reflection of any problem that arises, as its goal, the critical representation of a natural or artificial place. The urban sites, for example, represent the most of sedimentation and accumulation of those transformative continuity - obvious or hidden, present or missing - which, over time and as a whole, helped to configure the relevant characters of identity. The comparison with the character of specific places, the knowledge of the different sedimentary layers, the recognition of the values of witnesses, the distinction between relevant and irrelevant - to be implemented through the relief and redrawing it in a perspective of logical connection between parts missing, existing realities and modifying hypotheses - represent, as a whole, the conceptual assumptions for the construction of a new design of continuity. In this sense, a cognitive approach to graphics based, research based continuity, it is essential to identify those intonations architectural measures to redefine the lost harmony of the natural and man raped by the consumer society. A redefinition to be pursued through the conservation, regeneration and the quality of the architectural heritage of innovation and infrastructure of cultural landscapes and contemporary urban reality. Too many enclaves environment - rural and industrial, metropolitan cities and small towns, urban neighborhoods central and peripheral - are broken, or detached from any continuity between the parts and the whole that includes and features. The loss of continuity represents and symbolizes the decline of Western society in the failure palingenesis the new millennium. The twenty first century is presented, in fact, with a network of crisis offering an "immediate present" chaotic, messy, contradictory and conflictual both from a general point

of view, political and social, and from the particular cultural and disciplinary afferent the discourse on government land in its specific relationship between city and architecture. In this perspective, there can be no action for the protection of cultural heritage outside of a renewed ability to program a new idea of society more sensitive to issues of shared ethics and aesthetics of an undivided. The rigid self-knowledge and knowledge, not the sharing of disciplines, the lack of continuity between the various precincts of human thought are considered to be among the main causes of the drift qualitative afflicting the contemporary territory, needy, on the contrary, a science multicriteria shared. The ability to plunge more disciplinary information on a single theme can be a path of research fertile and productive in order to avoid the discontinuity of the shares dissolutive - tangible and intangible - that have contributed to degrade the cultural heritage and natural resources of our territories. Territories, especially the Italian's one, marked by the presence of driven millennial tracks, infrastructure networks, urban settlements and architectural monuments inherited from tradition and constructive founding of Roman antiquity: a culture that, with the exception of Rome city, based his work through a breakdown set of natural spaces (web centuratio chromatic) and artificial ones (the orthogonal grid of the castrum and the colony). Division of soils and construction of the works and civic infrastructure based on a rational logic able, however, to produce architectural and urban models always different from each other: a conceptual approval that did not prevent, within a perspective of continuity shared a wide case studies of different solutions from each other. Diversity in continuity: this was the main theme that has characterized amending, for nearly two millennia, the construction of urban and rural landscape of the Italian peninsula. Unfortunately that primitive rational order, produced by Roman urban culture and developed continuously until the first half of the last century, it was suddenly transformed in the last fifty years, a continuity of diversity that have undermined the equilibrium landscape of the "Bel Paese" . Natural areas marked by uncontrolled development savage urban peripheries heterogeneous and fragmented, towns attacked by building interventions inconsistent with the existing built, abandoned and derelict old centers: these are the main damage done by a consumer society unable to keep, if anything, regenerating, the significant cultural heritage that the remote past and next had bequeathed to the recent past and the contemporary. Reflect, through drawing on the different phases - and then evolutionary regressive - that have characterized the long period of construction - ordered and disordered then - the rural and urban landscape of the Italian peninsula, it means to ask a question regarding the possibility, or not, of continue to consume or, conversely, preserve and regenerate what has come to us in terms of tangible and intangible cultural heritages.

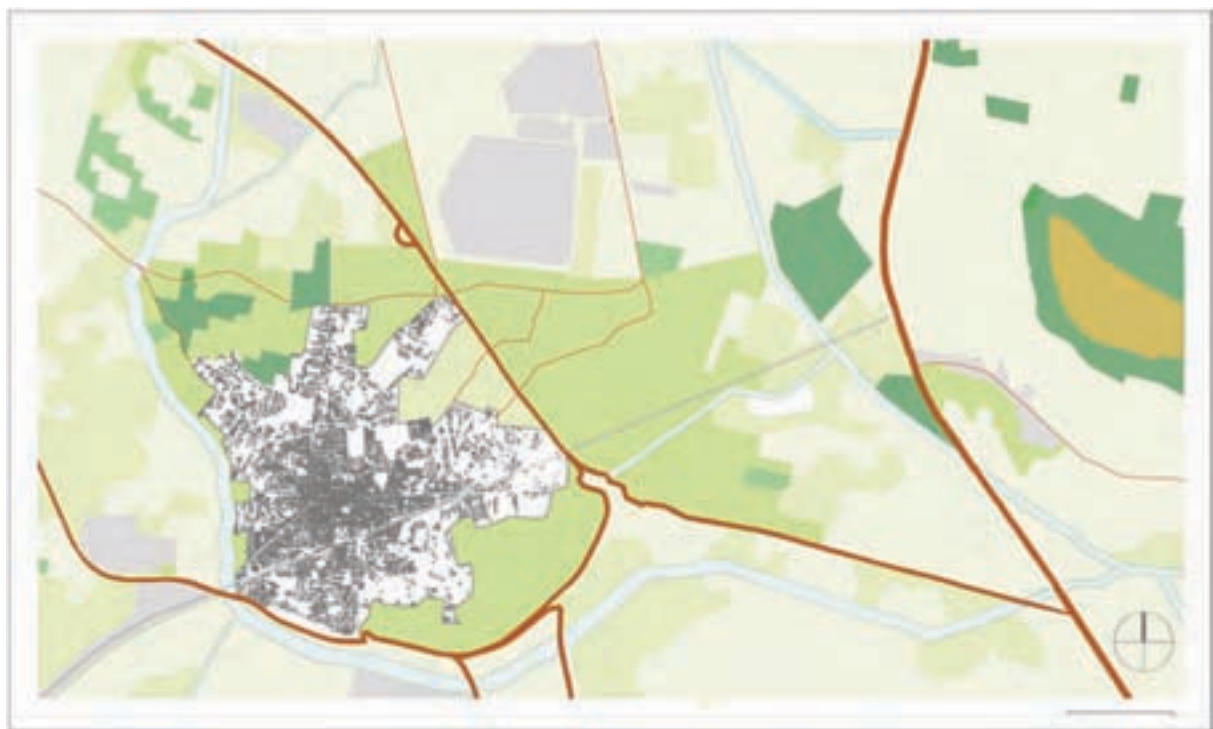

Fig. 1: Redesign of the City of Acerra, 2013.

2. Descriptions: cities and recognition

The town of Acerra, north of Naples, is an urban exemplum of great interest to test the responsiveness of the architecture design for the theme of continuity: both for the characteristics of its urban form primitive - of Oscan origin and, subsequently, Roman - and for the presence of an imposing architectural monument, the Castello Baronale, able to enclose itself, the history of the city where it is located. An examination of the relationship between the shape Urbis original Acerra and his contemporary deformitas Urbis - produced, the latter, from indistinct consumption of land peripheral and central - is addressed, in this study, not only through the analysis of the different phases historical growth of the city but also through the study of complex graphical changes made to its architecture is more representative. The dual reading concerning the knowledge of the fact urban and architectural object, it tends to make sure, first of all, if you can identify a consistent quality of the territory and the quality of architecture in certain historical periods, if, in addition, presence of an environmental decay there is a similar deterioration of the building fabric, if finally established a relationship of interdependence between the processes of evolution or involution regarding the large territorial scale and medium-scale architecture, the latter is able to produce, in regular operations of regeneration and reconfiguration mechanisms, environmental restoration, large or small. In this sense, the ability to exist, persist and resist demonstrated by a monumental complex - albeit abandoned and degraded - as the Castello Baronale of Acerra is the best answer - in terms of continuity - that widespread loss of recognition of the characters of identity territorial and urban places. The working hypothesis addressed in this study is based on the certainty that the cornerstones typological monumental - especially those who hold the historical memory of the places to which they belong - may represent the nodes of a network sheet material spread on the territory from which to tackle the most the great theme of environmental restoration and landscaping.

3. Setup: Tracks and specificity

If it is true that the signs of the territory, both natural and artificial ones, have the ability to detect the main characteristics and evoke the history of human settlements, then it is equally true that, between the centers of the middle Campanian plain, the city and the 'agro environmental exemplum of Acerra represent a quite unique and problematic. Unique to the presence of a rational urban layout, strongly geometrically placed in its historical core, conversely, in a rural setting that is characterized by the irregular pattern of agricultural land. Further problematic for the widespread presence of riverbeds, canals and marshy areas who, with their tortuous development or heterogeneous location end up further fragment an area that in the past has frequently been forced to rebuild their characters identity due to fragile ecotopo, so strongly vulnerable. Uniqueness and problems of agro Acerra (ancient liburia) characteristics are historically consolidated and form a specificity not irrelevant in the process of transformation suffered by the Campania Felix from the age of copper. Of Oscan origin, Akeru (of which Acerrae is the Latin name) was stabilized as the control center to the Campania and Puglia, giving rise to a small but vital community devoted to agriculture and pastoralism. Activities developed precisely because of the geographical complexity of the membership site full of vegetation, wildlife, courses and lakes. Fertility and specificity are considered the two main characteristics dell'Akeru Oscan which allowed the primitive riverside village to develop within the Osco / Etruscan¹ Campania in a small town, most likely, due to the current urban district located at noon compared to the size of the walled and fortified Baronial Castle. Then the experience of living in the structure Oscan Akeru, in 332 BC, he received first, in the Roman provinces, the civitas sine suffrage, ie the Roman citizenship without the right to vote, becoming, in fact in Acerrae Roman colony important bounded by walls regular and irregular able to incorporate the primitive settlement Osco. As pointed out by Paolo Zanker "A similar situation is also true for many of the ancient Roman cities of Lazio, Campania and Etruria with their archaic structures, often built on land conditions. In the case of nearly all these ancient cities we are dealing with elements incorporated later in the Roman state, where modern public buildings had to be inserted in a city that already existing. [...] Above all the cities in Campania and Etruria, before being "Romanized", showed the imprint of their own cultural traditions."²

Fig. 2: Typological schemes of pre-Roman village.

4. Overlays: network and rationality

As regards the design of the historic territory Acerra in the last two centuries BC, Acerrae and agro Acerra were located geographically outside dall'Ager Campanus or from the wide extent of country - fairly urbanized and marked by the division of the orthogonal Roman centuriatio - located north of Neapolis and going up to the south bank of the Volturno, is also included, from west to east, including the Domitian coast and the mountain ranges of the chain.³ The lack of centuriatio in his home territory did not prevent, however, the Roman Acerrae to acquire a plant in orthogonal grid able to incorporate the irregular Osco village. From the historical point of view the Roman Acerrae remained loyal to Rome during the Second Punic War and was besieged in 216 BC that partially destroyed by Annibale. It was rebuilt in 211 BC with the help of the Romans, during the social war was again besieged by Papio Mutilo, but was defended by the consul Lucio Giulio Cesare. In this specific period, most likely, Acerra changed its urban plan by acquiring a wall of square shape - a rectangle elongated in a north/south measuring approximately 360 x 450 meters - structured through a decumanus maximus and cardo maximus. The overall design drew its form from the Roman castrum evolving, in fact, also through the incorporation of the village Osco, in a real colony based on an orthogonal grid. Specifically, it became, first, Municipium and, subsequently, in 22 BC under the Emperor Augustus, a colony for veterans. Some inscriptions have received attest to the existence of cults and temples dedicated to Iside, Serapide and Eracle. In addition, the presence of the ruins of the theater, dating from the second century BC, under the Castello Baronale, demonstrates the importance of the urban structure Acerrae acquired in the Roman period between the second century BC and the second century A.D. The idea of redesigning dell'Acerrae Roman presented in this study takes shape from those faint traces historical and, above all, a reflection on the system of the ancient city urban as it appears today in the quadrant between the area of the Castello Baronale north, along the axis of Via Magnolia e Via San Gioacchino, Via Calzolaio and Corso della Resistenza and Via Soriano in the South, certainly resistance to the west and to the east, along the routes of Via Ferraiolo and Via Cuomo. A dial divided into four urban areas separated by the system decumano and thistle materialize, from west to east, from the roadway of Via Roma and Via Pennino and by peremptory north-south configured by the current Via Leonardo da Vinci and Via Duomo. As with similar settlements in Rome, "[...] had to create a basic model that could be used in a versatile, a model that then found application in the form of the first coloniae romanae implanted for a few hundred Roman citizens. All these first civilian settlements are structured according to the same scheme extremely simple. This pattern was characterized only by the network of streets strictly axial and symmetrical with the corresponding blocks of houses, also by two new substantial peculiarities: these foundations not only lie on a street of big communication, but one of their axes more directly coincides with it. The new type of model allowed in fact a versatile use, but later with the increase in spacious buildings such as the theater, the amphitheater and the baths, suffer great difficulties to wrap them in the system of lattice often too tight. In addition, this urban scheme, rigorous in its simplicity and consistency, was

eminently suitable for a quite flat terrain."⁴ In the same way, the four-part urban Acerrae presents, first, a series of rectangular islet oriented in the direction west - east, located on the Course bordering the western side of the Resistance, in addition, the large size of the semicircular Castello Baronale (former Roman theater) with the front and irregular neighborhood Gravina, and finally, the area of the cathedral that has, near its apse a configuration 'broad green glade rectangular in shape, real urban void, which could bear witness to the ancient presence of a hole inhabited by the above mentioned temples dedicated to Isis, Serapis and Eracle.⁵ The compact and rational morphology of the ancient center of Acerrae tells the story of a city fortified, aware of its strategic positioning within the Campanian plain, on the road leading from Naples to Benevento and next to Popilia or the Roman road, from Suessula, pushed south of Salerno. This positioning, so the condition of the city - fortress, on the one hand Acerra forced into a lasting work of rebuilding of its urban fabric, on several occasions destroyed by the attacks and sieges suffered in the course of two thousand years, it has also produced a strong stability of the closed path in the Roman curtain wall.

Fig. 3: Hypothetical reconstruction of Roman Acerra.

5. Reinterpretations: city and territoriality

In the post-imperial, in the fifth century AD, Acerra was first aggregate in Naples, and later dominated by the Lombards, who built a tower on the site where the present Castle (826). Attacked and partially destroyed by the Saracens in 881, it becomes Norman County. At this time, under the guidance of the various Goffredo, Ruggiero, Roberto e Riccardo di Medania, have to be traced back to the first extensions of the fortified structure of the Castle, situated to the east of Lombard tower, with a factory in parallelepiped shape characterized by inlaid decorative geometric shapes made of tuff yellow and gray. In the Swabian period, the feudal lord most important was Tommaso D'Aquino, linked to the Emperor Frederick II. During the Angevin and Aragonese ruled the city, household accounts and Origlia and Balzo Orsini and the Count Frederick of Aragon, the future king of the Two Sicilies. From 1496 until 1812, when it was abolished feudalism, Acerra was led by the family De Cardenas. Between the late sixteenth and early seventeenth century, the territory was affected by substantial agro Acerra reclamation of marshy land located north of the town who meanwhile was expanding beyond the perimeter of the first urban - corresponding to the current neighborhoods of Old Town (Maddalena, S. Giorgio, S. Cuono, Annunziata and Sott'o Muro) - with the addition of new houses built along the main roads. The reclamation of its land of origin are documented in historical cartography since the seventeenth century through the map of the *"Campaniae Felicis typus"* prepared by Alessandro Baratta and attached to the Panegyricus Garcia Barrionuevo in 1616. In such a design is clearly visible the complex system of the catchment area of agro Acerra completely surrounded by the two arms characterized by a dense wooded area on both sides of the northern branch that is fed by the headwaters of the Calabricito and Mefito. A portion of this map will be repeated in 1860 by Gaetano Caporale in the *"PIANTA COROGRAFICA dell'agro acerrano e contorni nel XVI secolo"* printed by lithography Richter & C. of the document graph is of great importance because it specifies, in its focus the focus on agro Acerra, all those names associated with urban places, in rural places, to road layouts, paths to river linear spatial infrastructures such as bridges or point like the mill. In the redesign, as well as in its original iconographic source or that of Barrionuevo, are not present rectangular of agricultural funds still present today in the design of the territory north of Acerra and appear designed for the first time in the *"TOPOGRAFIA DELL'AGRO NAPOLETANO"* of G. A. Rizzi Zannoni - G. Guerra of 1793. This map is documented increased reclamation agro Acerra after the one desired by Don Pedro de Toledo in 1592, or in full viceroy period, and described graphically in the redesign of the Barrionuevo of Caporale with the phrase "Lagno nuovo": in fact, Alfonso de Cardenas in 1722 "reclaimed the Pantano with the construction of a network of canals, the planting of twenty thousand poplars along their banks, and put under cultivation 1,773 bushels of land".⁶ Specifically, the map Rizzi Zannoni - Guerra highlights the complex structure of the saltus Acerra compared to the homogeneity Ager Campanus: first in the northern part of the ancient swamp is represented the new system of channeling secondary punctuated by long rows of poplars and large conforming agricultural funds rectangular sent for grazing and, at noon, on the one area destined to agricultural crops in close connection with the town of Acerra. A connection that becomes organic to the city through a dense network primary and secondary road well documented in the *"Pianta Corografica Dell'agro Acerrano - Del Dottor Gaetano Caporale"* in 1859. The structure of agro Acerra even though it follows the allocations identified in principle the map Rizzi Zannoni - Guerra of 1793 presents an extensive fragmentation of the soils due to the abolition of feudalism and the subsequent division, targeting the less affluent citizens of Acerra, of the earth agricultural⁷. From reading the *Pianta Corografica* is that the southern part of agro Acerra undergoes a greater subdivision of land, highly fragmented, and tends to structure of a complex plot and irregular secondary road connected on four core to Naples, Benevento, for Pomigliano and Sannereto - which, starting from Acerra, radiate in the surrounding area. In addition, the agro Acerra is crossed in the north east, south west of the new railway line Naples Caserta that touches the town in the southern part of its urban fabric. In 1859, the urbanization of the countryside is now well established through the widespread construction of new farms in addition to those ancient huts, called "pagliare", built after the reclamation viceregal for the shelter of buffalo. After the *"Pianta corografica dell'agro acerrano"*, published in the volume of Gaetano Caporale, the successive transformations of the territory are documented through a rereading of cards Military Geographical Institute.

Fig. 4: Drawings synthesis of the tracks leading agro Acerra taken from the table of Barionuevo (1616), the "Topography of agro Neapolitan" Rizzi Zannoni and Guerra (1793) and the "Plan of the town of Acerra" by G. Caporale (1859) put back together using a graphical I.G.M.

6. Leaks: city and atopic

The paper I.G.M. most recently recorded three major transformation of agro contemporary Acerra: first, the presence of a large industrial area including the new incinerator in the ancient quagmire; also growing like wildfire in the city of Acerra beyond its historic core quadripartite and finally the presence of complex highway system of the median axis and the axis of support with their infrastructural hooks represented by two major junctions in the southern part of agro and a large hub in the northern sector. New signs that overlap with those tracked genetic however still present on the ground and, with their history, represent stays indelible able to make visible the main characteristics of recognizability, agro Acerra. What, at present, is more compromised in the agro Acerra is the original differentiation between the tracks irregular "saltus" and the clear, rational, Urbis form of Acerra, now heavily compromised by urban sprawl implemented over the past three decades, but already started in the nineteenth century as a result of the demolition of the walls. Curtain wall that in the "Pianta della Città di Acerra" designed by Gaetano Caporale is already completely disappeared except for a few vestiges incorporated into the urban fabric of the city as, for example, the fragment with cement bag still visible during the excavations conducted by Amedeo Maiuri.⁸ With the disappearance of the city walls you start that process of growth "like wildfire" of the city that will lead to peripheralization general building fabric around the outside of the old town no longer subject to the mandatory rules of the design and measures of urban lots present inside the walls. The Castello Baronale, in this context, is an element of permanence and stability in the building fabric inner witness to the historical center: an element from which to start to reverse the process of degradation and dissolution of urban quality suffered from Acerra in the last four decades.

7. Regeneration: Monument and identity

The Castello Baronale expresses this attitude of witnesses from both the urban point of view - for the pivotal role that the monument takes its place himself between the homogeneous city of ancient plant and the heterogeneous, with recent expansion - both from the architectural point of view for its ability to represent, through complex layers typological and morphological, about two thousand years of the history of art of building. The Castello Baronale, in fact, follows its typical floor plan in the shape of a semicircle, an ancient pre-existence of the Roman: a theater building with semicircular "cavea" whose archaeological remains are visible in the basement of the east wing of the "noble palace". The original layout of the Roman era, through architectural additions and subtractions, it is built from the Middle Ages until the eighteenth century, a fortified complex real schedule of witnesses not only of the architectural history of Acerra but also of its social history. First, a medieval tower which is coupled to a building of the Norman period, then a Renaissance building defended on the back entrance portal which also functions as the guard, and finally a "granile" century: four different buildings connected together and surrounded by a continuous high bulwark semicircular characterized, on the south by an elegant Renaissance portal opposite there Piazza Castello connected by a bridge with three arches a

wide moat. The analysis of the different stages of growth, from ancient to contemporary times, which have reported to the theater before, and the Castle, later, to the relative phases of urban growth of Acerra is a kind of pictorial evidence of the inevitable reciprocity agreement exists between continuity as order and discontinuity understood as disorder. In this sense, it is true that for nearly two thousand years, the relationship between order and continuity has produced a consistent growth between the monument and the city is equally true that in recent decades the crisis of this report has involved the degradation of Castello baronale and the disintegration of Urban recognizability of Acerra. Retrace the different stages of growth, the city and the monument, meant regain a culture critic capable graphics to emphasize the contemporary urban and architectural process of dissolution of Acerra. In this sense, the recent reconfiguration of the Castello Baronale and the neighboring urban areas, could represent a first turnaround virtuous having as objective a gradual process of regeneration and urban innovation albeit in continuity⁹ with the past.

Fig. 5: Scenes building of urban fronts looking the Castello Baronale of Acerra.

Note

¹ Formed in the north - western part of the Campania region around the sixth century BC the Oscan included, in addition Akeru, also the towns of Atella, Calatia, Cales, Compulteria, Casilinum, Laticula, Liternum Suessula, Trebula, Volturnum and Capua, which, in its own name "caput", contains and emphasizes its role of capital compared to the other eleven centers.

3 And it is on this side of the Roman chromatic that bordered the agro Acerra in turn characterized, at noon, the semi circular perimeter of the great bend of the Clanio that, because of frequent overflows, contributed, for long periods, waterlogging of land Acerra. Overflows that, on the one hand, have imposed a continuous soil remediation implemented through a capillary shallow water, drain the countryside, and most rural landscape. "The agricultural landscape was fore made up of a wooded area, with rich community pastures and cultivated land, that is, it was the ancient landscape of the "saltus", of which he speaks Sereni. The diversity of agro Acerra - the "saltus" - compared to regular landscape in closed lots may be one of the reasons for the absence of the Roman centuriatio, which disappears at precisely the course of the Regi Lagni."

The Conservation of Jerusalem's City Walls

Avi MASHIAH

Israel Antiquities Authority - Conservation Department.

E-mail: Avimashi@gmail.com

Abstract

The Old City walls are one of the most important cultural heritage assets of Jerusalem. They are without a doubt the most prominent monument in the city's urban landscape and their influence on the development of the modern city has been decisive.

In 2005 several of the stones from the Old City walls became detached and fell into the schoolyard of the Collège des Frères. Consequently the Israel Antiquities Authority Conservation Department undertook a survey for the purpose of gathering data about the physical condition of the walls. The results of the survey pointed to a variety of physical problems along the entire length of the city walls, and in 2006 the Prime Minister's Office decided on a project the purpose of which was to conserve and rehabilitate Jerusalem's city walls. The project was directed on behalf of the Jerusalem Development Company and the Israel Antiquities Authority Conservation Department was entrusted with its planning and implementation. Work began in the field in January 2007 and continued until 2012.

The Wall reflects the city's colorful history. During our work on the different sections of the wall we tried to ensure a balance between the original architectural values of the monument and its urban and national values.

Keywords: Intervention principles, conservation dilemma, national-historic value, architectural value, urban element.

1. Introduction

Jerusalem's Old City walls are the largest and most impressive monument in the city's urban landscape and one of its most important cultural heritage assets (Fig. 1). They are approximately four kilometers long, with seven portals set in them: the four original main gates that point in the four cardinal directions and three secondary or later gates. The city walls that we are currently familiar with were erected during the Ottoman period at the initiative of the sultan, Suleiman the Magnificent. These walls are the latest in a series of fortifications that enclosed Jerusalem throughout history. The more ancient walls have been exposed and studied and some of them are even exhibited to the public. Some of the ancient walls are incorporated in the construction of the Ottoman fortifications and can be seen in certain segments. The Ottoman period city walls are preserved in their entirety, with the exception of a few changes that were done to relatively small sections of them.

Jerusalem's walls were erected in order to defend the city and its residents. Over the years, as security improved and people moved outside the city walls, the original purpose of the walls became irrelevant. The city walls today define the region of the Old City and its cultural and historic characteristics.

The condition of the city's walls, which are exposed to constant destructive processes and damage, has deteriorated over time. The reasons for this are varied and stem from human factors, as well as environmental and climatic causes. The Jerusalem City Wall Conservation Project was begun in 2007 after a number of stones fell into the Collège des Frères courtyard, which is adjacent to the walls.

This extensive project was implemented by the Israel Antiquities Authority Conservation Department. Work on such a large scale had not been carried out on the city walls since the rehabilitation work that was conducted at the time of the British Mandate during the 1920's.

Fig. 1: View to the western parts of the Old City wall.

2. The Preparatory Work

The main goal of the project was to conserve the walls. But in the meantime it was important to stabilize the walls from an engineering standpoint and thereby eliminate any immediate danger in those places where the physical condition was undermined. In addition, elements that were representative of the wall's architectural, urban and historic values were restored, all of this while maintaining the diverse cultural impressions that are apparent in it. There are many aspects to the city walls, and in line with this, comprehensive preparatory work was carried out prior to commencing the conservation and rehabilitation work. First of all digital-spatial measurements were made of the walls for the purpose of mapping and preparing plans. Afterwards, we documented the walls and surveyed them from a historic, urban and physical aspect and also performed a natural resource survey to document the fauna and flora that exists on them. Later we divided the walls into fourteen work segments (Fig. 2). Each of the segments was surveyed from a historic and physical standpoint and was documented with photographs and drawings. Only after we completed the analysis of each segment did we consolidate the detailed plan.

Fig. 2: A map of the walls divided into fourteen work segments.

Fig. 3: The seepage points of water into the wall and its further results.

The main conclusion of the preliminary physical engineering survey was that water seepage was chiefly responsible for the deteriorating processes that were at work in the wall. Most of the problems - stone deterioration, the disintegration of mortar, vegetation taking root, the rusting of steel parts etc - stemmed from water percolating into the wall. Moreover, the problems that were created in the wake of the seepage further exacerbated the percolation and brought with it a new cycle of deterioration (Fig. 3).

Thus the aim of the conservation action was to remove any hazards in the sections of the wall which were in a physically unstable state. It included: completing any missing stone work and replacing it where necessary; filling in missing mortar and sealing the top of the wall in order to prevent water from penetrating into the core of the wall and washing away the mortar. Other aims of the conservation included restoring the building elements so as to present the urban and architectural values of the monument, and treating the decorations and inscriptions in order to protect them and present them to the public in as befitting a manner as possible.

The intervention principles regarding the preservation of Jerusalem's city wall were drawn up in order to ensure a professional and controlled conservation process. The principles directed the intervention measures which were meant to conserve the historic, aesthetic and technological values of the monument, in accordance with the Israel Antiquities Authority policy for the conservation of built heritage.

3. Conservation Issues

Since their construction at the time of Sultan Suleiman the walls have undergone numerous changes, which reflect historic events that have influenced their appearance. The current intervention in conserving the walls was another one of those events that left its mark on them. Some of the changes have an added value that contributed to the original architectural value of the walls. Many of the changes in the walls occurred in the latter part of the twentieth century when the area became a war zone. When it came time to treat the damaged parts of the walls we were faced with a complicated dilemma: whether to commemorate the events that are of national value by preserving the battle damage in the walls or to preserve the original architectural value of the walls by restoring the damaged condition to its previous state.

This dilemma will be demonstrated below on two of the gates of the city.

4. Conservation of Zion Gate

A good example of dealing with this sort of quandary is illustrated by how the conservation work was done in Zion Gate. More than anything Zion Gate symbolizes the struggle for the Old City. The treatment of the gate was carefully done taking into account its national significance. Besides the gate's historic values, other values were also manifested during the conservation planning of the monument:

4.1. Historic Values.

The gate was built by Suleiman the Magnificent. For the past 470 years or so it has been part of Jerusalem's city wall. Its construction was the topic of considerable disagreement from the day it was erected because Mount Zion was left outside the city limits. The gatehouse is associated with the Jewish Quarter and is even referred to in historical sources as the 'Gate of the Jews'.

The most significant historic event since the construction of the gate is the attempt that was made to breach it in May 1948. Then, as in the Six Day War of 1967, it was part of the border and where much of the fighting took place. The gate bears the physical evidence of the effort to break through to the Jewish Quarter and has therefore come to symbolize the capitulation of the quarter (1948) and the unification of Jerusalem (1967). Its national-historic value is derived from this. Today the gate serves as an entry point to the Old City for groups of students and tourists and it is a focal point where discussions are held about national heritage and the battle heritage of Jerusalem (Fig. 4).

Fig. 4: The Zion Gate façade throughout history, including the conservation work carried out in 2007.

4.2. Architectural Values

The gate's façade is adorned with impressive decorations. Decorated stones are scattered across the façade, around the opening of the gate, around the arrow loops and in the upper sentry post. The standard of the architectural design and the decorations of the gate do not fall short of those of Jaffa Gate and Lions' Gate. The flat arch of the opening resembles the form of the arch in Damascus Gate. Inside the gate there is a guardroom and an ascent to the roof of the structure. Zion Gate was preserved in its entirety as an "angled" gate, even though it functions as a passage for modern transportation.

4.3. Physical Problems

Zion Gate was damaged during an attempt to breach it in 1948 and the stones in the gate suffered considerable destruction. It is apparent on many of the stones that the damage to them has accelerated the deterioration processes. Many of the stones were loose and they presented a hazard to pedestrians that passed through the gate.

Caper bushes took root in the joints between the damaged stones and a microbiological layer covered parts of the damaged stone; this obscured the gate's decorations and even hastened the destructive process (Fig. 5). Vehicles passing through the gate caused mechanical damage to the gate's pillars and walls. A layer of calcite encrustations and soot covered most of the stones inside the gate. This was mostly caused by the exhaust of vehicles that pass through it. This layer "encased" the stone beneath it, a fact that hindered its removal and weakened the stone.

Fig. 5: Stone deterioration and vegetation that took root in an arrow loop, before and after the conservation work.

4.4. Conservation Principles

The discussion concerning the conservation of Zion Gate is different than the discussion about the rest of the parts of the wall. For the most part it is possible to map the string of historic events that shaped the different sections of the city's wall and logically select the type of treatment based on the values embodied in them; however, in the case of Zion Gate we were confronted with a planning dilemma. As previously mentioned, two events shaped the appearance of the gate: its construction by Suleiman and the attempt to breach it in 1948, which resulted in damage to the façade and turned it into a symbol for the Jewish people. When asked to conserve the gate we could not ignore the dichotomy between the architectural value and the national-historic value. That being the case, we were asked to decide whether to emphasize the architectural value and rehabilitate the considerable battle damage in the gate structure, or conversely, stress the national-historic value and preserve the battle damage.

When we first embarked on conserving the Zion Gate's façade it was clear to us that the attempt to breach the structure in 1948 left its mark on the gate's façade more than any other event since its construction. Therefore, we thought it proper to make every effort to preserve the scars of the event. Nonetheless, as a gate whose architectural and design quality are preserved in its plan, we also

wanted to stress the original aesthetic value of the gate structure. To this end we sought to achieve the delicate balance between restoring architectural elements and preserving the damage in the stone. In all of the proposed planning alternatives, preserving the physical effects of the breach from 1948 was of the utmost importance and the architectural values were emphasized differently.

The alternative that was selected is the one that preserves the national-historic values in the gate's façade, namely, the bullet marks, which are a kind of diagram of the battle on the façade, by stabilizing the stones that were severely deteriorating as a result of the damage from the fighting. The intervention preserved the architectural values. It focused on the region of the poorly preserved arch and dedicatory inscription that cites the gate's builder – Sultan Suleiman – and its date of construction – 1540 (Fig. 6).

Many historical photographs of the gate were collected and they facilitated an in-depth examination of alternatives for the conservation of the inscription and the decorations.

4.5. The Conservation work

During November 2007-June 2008 conservation measures were carried out on Zion Gate.

The stones in the gate were mapped and ranked according to three levels of deterioration: stones that were in immediate danger, stones that were severely deteriorated and stones that were slightly weathered. The extent of the conservation intervention that was required for each stone was determined accordingly.

In order to stabilize the stone we first treated the microbiology that had developed in the damaged places and which had accelerated the deterioration of the stone. Afterwards the stone was stabilized in the areas that had been damaged during the hostilities and the joints were pointed up with mortar. The conservation work on the stone included replacing missing stonework with stone and lime-based mortar and reinforcing the stone by means of stainless steel pins.

Bearing in mind the value of the original material and its contribution to the authenticity of the monument, only those stones that had lost their load bearing capacity due to the deterioration processes and destruction were replaced. The replacement of stone and completion of stonework were done utilizing stone that is indigenous to Jerusalem and its environs, of the kind that was commonly used in the stone "mosaic" in the wall.

The Gate Arch and Inscription. During the intervention the existing condition was cleaned and documented; later additions were removed; the field of the arch structure was documented and analyzed; a uniform hue was restored to each stone and a homogenous appearance was created for the inscription; the remains of the letters in the inscription were highlighted to increase its legibility, without obscuring the traces of damage from the gunfire and mortars on the surface of the gate. (Figs. 7).

Fig. 6: The gate arch and dedicatory inscription in Zion Gate, prior to the commencement of work and after it.

Fig. 7: The dedicatory inscription before and after the conservation work.

5. Conservation of Damascus Gate

Damascus Gate is the principal gate in the city's northern wall and serves as the main entrance for pedestrians to the Moslem and Christian Quarters.

Damascus Gate has served as the northern entrance to the city since the Roman period. At that time the city's longitudinal roads also began to follow the route that currently exists today. An urban square from this period was exposed beneath the Ottoman gate and it is open to the public in the Roman square museum. The transition from the Roman building technology that is evident at the base of the gate to the Ottoman building technology can be seen on the gate's façade. The central location of the gate and its function turned it into a commercial center. Both then and now the height of the gate towers afforded one a good view of the surroundings.

Damascus Gate is the most magnificent and monumental of all of the city's Ottoman gates. The structure is characterized by its symmetry and a system of ornamentation which add to its monumental appearance and emphasizes its symmetrical design. The decorative elements in the form of stone torches positioned above all of the gate's crenellations distinguish Damascus Gate from the other gates of the city.

Damascus Gate was well preserved; however, the ravages of time and previous interventions were clearly apparent (Fig. 8, 9). The weathering and destructive processes were mainly evident in the broken and missing crenellation decorations and in the stained stone of the gate's facades. In addition, there were encrustations in the gate's interior and the plaster was crumbling as a result of dampness.

Fig. 8: The gate's façade prior to the conservation. 2010 **Fig. 9:** The gate's façade after the conservation. 2011

5.1. The Issue of Conserving Damascus Gate

Damascus Gate is characterized by its decorative richness. In pictures, paintings and historical drawings the gate can be seen in all its glory, whereby the dominant component in its design is the crenellation that is topped with stone torches. Along with its splendor, the different weathering processes were evident in the gate's facades and interior. An extensive portion of the façade's surface, particularly the upper half of the gate, was covered with dark stains that have had a profound impact on the appearance of the gate already in the mid-nineteenth century. The ravages of time have also left their mark on the decorations, some of which have not survived or were found to have suffered significant weathering.

The chief concern we faced when considering the conservation of the gate was whether to emphasize the structure's architectural value or its historical value of the structure. Completely returning the architectural value of the gate meant totally restoring the missing decorations and cleaning the structure's facades. On the other hand, conserving the historical value would have meant focusing on stabilizing the existing decorations and cleaning only some of the stains in order to preserve the element of time and aging of the stone. An intermediate alternative – that is restoring the decorations and cleaning only parts of the facades – would create a significant visual difference between the new stone and the old.

5.2. Conservation Principles

Since it is the most monumental and magnificent of the gates in the city wall, it was decided in the planning phase to emphasize its architectural value, its size and the richness of its decorations (Fig. 10). We now faced a new dilemma regarding the nature of the restoration. Although at first glance the ornaments on the gate appeared to be more or less homogenous in shape, after a careful examination of them we discerned considerable variation in the proportions of their components. The historical survey revealed that during the British Mandate the gate underwent extensive rehabilitation that included: removing all commercial activity from the gate plaza, preparing an open plaza, rehabilitating

the gate and restoring decorations. This meant that in order to implement the restoration we needed to relate not only to the Ottoman decorative typology but also to the characteristics of the Mandatory restoration. A detailed examination of all of the decorative details in historical photographs from the mid-nineteenth century until the end of the Mandatory period allowed us to formulate a plan regarding the individual treatment of them. The center firing slit was the only detail we found that had undergone disproportionate change in the 1967 war. The decoration at the top of it was completely destroyed and the firing slit itself was damaged. The arrow loop was rehabilitated after the war, but the decoration was not restored. An examination of the decorations also revealed that the symmetric axis of the gate was emphasized in the Ottoman period. This was reflected by the height of the decorations in the corners of the towers and the symmetrical placement of various ornaments. The torch ornaments were completed together with the rehabilitation of the gate at the time of the Mandate; however, the proportions of the restored components were not uniform. Furthermore, errors were discovered in the restoration measures that were implemented. An example of this was the location of a pair of decorations on the western tower's crenellation which were switched. This study led us to the decision that each decoration would be restored according to the proportions of the original Ottoman decoration, as they appeared in historical pictures. On the crenellations where there was no decoration or suitable documentation, the decoration was restored based on the proportions of the decoration symmetric to it on the gate.

Fig. 10: General plan – Damascus Gate façade.

5.3. The Conservation Work

Conservation of the arrow loop and its restoration necessitated stabilizing the loop from a constructive standpoint which was achieved by means of stainless steel pins. The decoration at the top of the loop was restored based on historical pictures. In addition to the decoration on the arrow loop seven other decorations were restored (Fig. 11).

In conserving this gate we tried to find the balance between the ongoing bustling commercial activity of the environs and conserving the architectural values of the gate which were sometimes damaged by commercial use. We held some meetings with the shop owners and the residents in order to coordinate the work, its schedule and results. The gate was dirty and covered with old signs and old infrastructure. Despite the difficulty of the work schedules we all had a common goal to improve its condition.

The microbiological stains and encrustation on the surface of the stone was steam-cleaned. A very thorough level of cleaning made it possible to match the color of the original stone and that of the restored stone (Fig. 12).

The gate's interior also suffered from massive stains on the facades (Fig. 13). Prior to commencing conservation work on the gate it was agreed upon with the owners of the shops that located inside the gate that the work would be done without interrupting the daily commerce there; thus we sought ways of treating the stains which could be simultaneously implemented with the commercial activity.

Fig. 13: The gate's interior before and during the conservation. 2011

6. Conclusion

During the course of the project we realized the extremely sensitive nature of any intervention connected with this monument. The rehabilitation policy regarding the Old City's walls not only favored conserving the walls as an architectural monument which history has left its mark on, but also preserving them as a living urban element in their environment. For this reason an effort was made to promote projects that could complement the conservation of the walls, such as developing exhibition spaces inside the cavities of the impressive guardrooms that are scattered the length of the walls and rehabilitating the paths along the remains of the ancient walls that are at the base of the Ottoman wall. Signage was posted along these paths, in cooperation with the municipal department of education, in order to enhance the residents' connection to the monument (Fig. 14). It was our hope that the Jerusalem City Wall Conservation Project would serve as a stimulus to rehabilitate the walls' surroundings and to sustain a high level of maintenance of the monument in its environment, as an open urban area that has unique historic and landscape values.

Two Different Approaches of Urban Renewals of Historical Districts: The Comparison of Bordeaux, France And Cincinnati, United States

Ana Gisele Ozaki¹

⁽¹⁾ DAAP - College of Design, Architecture, Art and Planning, School of Architecture Interior Design, School of Planning, University of Cincinnati, Cincinnati, United States of America
ozakiag@mail.uc.edu

Abstract

The purpose of this paper is to compare two cases of revitalization of historic districts: Bordeaux, France and Cincinnati, United States of America. In both cases it is quite evident that both cities were successful in their endeavors in transforming their historic cores into attraction points. Therefore, the focus of this study is how both of these cities managed to implement their revitalization processes.

The city of Bordeaux represents a mainly top-down approach concerning historic preservation. The city renovated its historic district in 2000, which was closely coordinated by the local government. This culminated into Bordeaux's inscription in the World Heritage List of UNESCO in 2007.

On the other hand, Cincinnati represents how an American city revitalized one of its historic districts, through mostly private actions. The city experienced an abrupt decline within its core, despite having one of the largest collections of 19th Century Italianate Architecture of any American city.

The concentration of power is fundamental in both case studies, but each city carried its own hierarchy and relationship amongst the stakeholders involved. This comparison aims to provide insight into the best practices concerning the process of revitalizing historic districts. This should lead to a further study on how to balance top-down and bottom-up approaches in historic districts in urban settings.

Keywords: historic districts, urban cores, historic cities, revitalization process

1. Revitalization of Urban Historic Districts

In most cities, urban renewal represents opportunities to change economic hierarchies and functions within the urban region, creating new jobs, and strengthening the city's position in the urban division of labor. [1] According to Anthony Downs, a Senior Fellow at the Brookings Institution in Washington, D.C., every downtown has three important functions: to provide jobs and income for local and regional residents, to provide a net tax revenue surplus that supports local government services received by other parts of the municipality, and to act as the focal point for the entire community. Adding to Down's perspective, central areas are also usually the oldest part of a city and contain many structures of local importance, in terms of architecture and history. These are areas of substantial capital investment (both public and private) in buildings, streets, utilities and other structures and services. Finally, they are also the representation of a community's pride and identity. By investing in these areas, communities have better chances to prosper as a whole and maintain a healthy economic and social base. However, downtown areas have reduced their ability to remain competitive. This is due, in part, to the movement of people from the city to the suburbs, competition from chain stores and shopping malls with local businesses, and especially, the increased use of automobiles. [2]

This paper will address the actions taken by major stakeholders in Bordeaux and Cincinnati: InCité, and 3CDC, respectively. Even though they both represent similar tools of performing the revitalization processes, they follow different structures and power contexts. While France relies on a

centralized and top-down approach to preserve its urban heritage, Cincinnati utilizes its historic assets as a way to achieve economic development.

1.1 Bordeaux

Bordeaux, France, has preserved its urban core in the new light of Alain Juppé's renovation plan of 2000 and the city's inscription in the World Heritage List of UNESCO in 2007. The city's originality in historic preservation relies not only in buildings and their preserved façades but especially in the preservation of the urban fabric, responsible for the city's identity.

From 1965 to 2005, the population kept declining in the historic urban core of the city. Many of the subsidized social housing had deteriorated, almost 12% of them were in inhabitable state and almost 20% were vacant. In addition, there were not many housing options, 85% of which were rental, and 66% efficiencies which were not suitable for families. These conditions created a significant turnover of residents and were detrimental to the neighborhood life and urban vibrancy.[3]

Since Alain Juppé's vision in 1996, with a global approach of planning and redevelopment, Bordeaux has managed to satisfy two urban forces: on one hand, the strict national and local historic preservation requirements and constraints, and, on the other hand, its urgency to re-adapt itself to contemporary needs and uses. The main actors in implementing these policies of rehabilitation were the City of Bordeaux and the Regional Planning Commission, the CUB (*Communauté Urbaine de Bordeaux*).

The city was founded during the Roman Empire, and its historic center is an outstanding urban and architectural ensemble of the 18th Century. It retained its generally Medieval design until the 18th Century, when, during the Enlightenment, the city's unique identity and urban design emerged and was consolidated. Bordeaux is the second largest urban district protected by the highest level of historic preservation in France (*Secteurs de Sauvegardés*). The policies of the *Secteur de Sauvegardé* are applied by the municipality in the local level and supervised by a strict commission from the national level. Punctuated by classical monuments, the *Secteur de Sauvegardé* encompasses the boundaries of the walled city of the 14th - 18th Centuries, the neighborhoods of the Medieval Quarter, the architectural and urban ensembles of the 18th and 19th Centuries, and the especially distinctive system of articulated places and 18th Century façades along the quays.[4]

In light of a new discourse, from 1996 to 2007, the city went through a transformation process that incorporated new criteria of preservation. The city administration performed a top-down approach to the revitalization of its historic district, having learned that the urban heritage is an important economic asset, but also a human and social product that requires the land use, urban fabric, and ways of life in the historic district to be preserved.

As many other French cities, Bordeaux relied on a new tramway system for the revitalization of iconic public spaces, and on the encouragement of public and private partnerships to help attract new inhabitants back into the city center. The city center prior to the renovation had a high vacancy rate. This new development in addition to bringing new residents into the urban core it preserved the historic city's identity. In order to brand the city and make up for "lost time" in the competition with other mid-tier European cities, such as Bilbao, Nantes, and Toulouse [5], Bordeaux also envisioned, since the beginning of this process the UNESCO.

Since 1996 and the definition of the big axes of the urban project, it was clear that the revitalization of the historic center represented one of the main elements in the new development strategies and that a new dynamic of project was being imposed to reunite the central neighborhoods, which could, finally, be called historic center. There were three reasons for this redevelopment:

- The reinforcement of the historic center is a strong issue for the agglomeration as a whole due to sprawling and its effects in the public finances.
- The second reason concerns the economic role that takes place at the urban core of Bordeaux, which is one of the main centers of employment and services of the region, by strengthening the existing economy and bringing new businesses.
- And evidently, since the façades of the quays and the historic district are of great heritage value, that has created the city's identity, they should be enhanced and protected in order to permit new uses and activities not only related to visitation.
- Along with the revitalization of the center the urban operation included:
 - The implementation of the tramway system that aims to reorganize the urban exchanges and displacement in the center of the city, and provides a better sharing of free spaces in releasing the streets of the huge automobile presence.
 - The redevelopment of the quays allows Bordeaux to return to the river and reclaim little by little the quays as a place for leisure and festivities.

- And the project of rehabilitation of the ancient neighborhoods, which has been possible through a partnership between the State, ANAH, Fund of Deposits and Consignations and the Urban Community (CUB).

The main questions guiding the operation were:

- How to provide these different actions that enable older neighborhoods to be reinvested by locals and visitors and ensure that they are available to all?
- How to find the perfect balance between economic activity, tourism, habitat and the everyday life? [6]

This global approach also required more legibility of legal and administrative constraints, simplification of financial arrangements, both for the public and private spheres. On January 2002, the City of Bordeaux engaged with the *Communauté Urbaine de Bordeaux* (Urban Community of Bordeaux), the State, the *Caisse des Dépôts et Consignations* (Fund of Deposits and Consignations) and the *Agence Nationale pour l'Amélioration de l'Habitat* (ANAH – National Agency for Housing Improvement), a discussion about a vast territory between the Garonne River and its courses.[7]

The city of Bordeaux released in 2002 a plan for general actions concerning the revitalization of the historic central district of the city, transforming it into an active and inhabited center. The focused area consisted of 501 acres and extends from within the courses (Arnozan to the Marne) to the Garonne River including the area between the Course de la Somme and the Rue de Bègles. The action plan aimed to improve the quality of life and residential comfort of the local population (current and future). The plan also sought to strengthen the social diversity (age, marital status and household composition), to diversify the residential offer and stop the progressive decline of the center. [3]

Concerning the historic district, the urban project included the cleaning of façades, the regeneration of the Garonne's riverbanks, and the commissioning of the tramway system that runs on a ground-level power supply. During this process, more than 350 buildings were listed on the inventory of the *Monuments Historiques* (French National Trust), a protection structure established in the country in the 19th Century. The UNESCO nomination process involved rigorous and exacting criteria of integrity and authenticity, and the seal came as the final outcome. [4]

In 2002, the City of Bordeaux and other public partners (the State, the *Communauté Urbaine de Bordeaux*, *Agence Nationale pour l'Amélioration de l'Habitat* and others) fixed tasks and means of InCité, which was previously called SBUC (Mixed Association of Construction and Planning of Bordeaux), in charge of what the State had established as public interest, meaning the habitat component, through a convention of Public Land for a period of 8 years, extended until 2014. The company took the name of InCité to "better communicate its new missions of urban renewal" and to promote the public good. [3]

InCité is an institution of mixed economy dedicated to the missions of construction, real estate management, redevelopment, planning of complex transactions, land purchase, marketing, housing, and social support. In July 1957, the municipal council of Bordeaux decided to create a mixed economy company, the SBUC with the mission of opening the new areas of Bordeaux to the urbanization process, when the city was going through a housing crisis. The Board of Directors was then chaired by Jacques Chaban-Delmas, the mayor of Bordeaux of that time. It began then a period devoted to the development of new neighborhoods and the construction and management of nearly 4,000 homes and local businesses within the districts of Grand-Parc, Bordeaux Lac, Benauges, Chartrons, Meriadeck and others. The institution works with almost 50 other partners within the public and private spheres and local residents, and remains a key player in the housing and urban development in the city of Bordeaux. [3]

This institution, under the municipality's designation, directed all the actions performed by the private developers in order to prevent gentrification and guarantee equitable conditions. Work within the previously neglected historic district had to be carried out under new, updated urban policies and incentives and needed to accommodate specific guidelines, incorporating not only the protection of the historic urban landscape, but also the social use of the buildings. By the beginning of its work, the city presented 230,000 inhabitants and 114,000 of residential units, the historic district, 27,700 people and only 23,500 residential units, while the National government required 20% to be social housing, the existing was limited to 14.7% and 70% was rented and 12% was vacant. By 1999, the urban core of the city was mostly vacant, populated by poor and minorities groups and lacking of social diversity. [7]

Since 2002, 1,876 units have been renewed only within the historic district, 83% of which are social housing units. The institution acted following the premises of: favoring the quality of urban life, reaffirming the economic and cultural role of the historic center, offering a contemporary habitat within a renewed historic heritage and, finally, reassuring its social diversity. In order to favor the goals of improving the quality of the urban life, the proximity services, the increasing transportation alternatives, reordering public spaces and improving the environment were envisioned and planned. Concerning the contemporary habitats within the renewed historic heritage, the goal is to rehabilitate 2,400 units from which 30% should be of social housing, create 53,820 square feet of commercial use and 330 new parking spots till 2014. [3]

The effective actions of InCité is due to the central control performed by this mostly public institution in directing the actions performed by the private developers, abolishing inadequate and safe risk buildings, and increasing affordable and social housing through the revitalization of the urban core. The scope of its work was defined by at least five different plans concerning the same area:

- Plan of Development - SCOT 2000: that envisioned a population growth of 33% for the regional conurbation;
- Local Housing Program - PLT 2002-2006: that aimed to diversify the housing offer, renew the ancient neighborhoods and offer social housing;
- Urban Displacement Plan – PDU: that wanted to protect the center from the traffic and develop an efficient public transportation mode;
- Local Urbanism Plan – 2005;
- Preservation and Enhancement Plan.[7]

The institution's initiatives have become reality through tools including tax incentives, oversight features and power to buy and sell properties, restructuring whole blocks in more healthy and livable manners, such as:

- Programmed Operation for Housing Improvement (OPAH): this tax incentive aims to assist the rehabilitation of housing in ancient buildings and offers subsidized rental in private properties within a specific perimeter. OPAH offers the possibility for owners to benefit from tax incentives, free technical and administrative consulting in exchange for a cap on rent or other income conditions. [3]
- Tax incentives from the Malraux Law: intended to protect the architectural heritage of the *Secteurs de Sauvegardé*. The building that will be renovated must be a rental unit (to be rented for 6 years) in an ancient building. The incentive discounts from the owner's income tax the total amount invested in the construction and rehabilitation of the building.
- Property Restoration Perimeter (PRI): intended to initiate the process of restoration of buildings in bad conditions of housing, to trigger the intervention from private owners in unsafe and unhealthy conditions, to avoid poor quality rehabilitation leading that could lead to subdivisions and small dwellings, and to enable the complete restructuring of an established perimeter in a certain given time.
- Relocation: InCité can relocate temporarily or permanently former tenants of buildings targeted for redevelopment. They could either be placed in a private rental unit subsidized by OPAH, buildings or units acquired by InCité, property of social housing administrators, or a hotel if the case is of a short-term relocation. The relocation process is also provided with social accompaniment, considering the economic fragility of each tenor.
- Declaration of Public Utility (DUP): once the PRI is defined, studies are addressed to areas of most priority, considering the DUP. These studies focus on sanitation, security, livability and enhancement of the heritage. Once the City Hall and Town Council define the priorities and deadlines, InCité must notify the owners of the properties and the work required in order to get them rehabilitated. In case of non-completion of the work, an investigation could lead to a piecemeal expropriation procedure.
- Land tenure monitoring for friendly purchase: for the purpose of demolition (ventilating the middle of dense blocks and creating inner gardens) or sale to enhance home ownership, social rents, restructuring by private renters (in larger units and/or with rental diversity of units).
- Right of urban preemption: from over 21,000 declarations of alienation intention, 0.6% has been preempted, since 2003. [7]

1.2 Cincinnati

The city of Cincinnati represents one of the richest historic districts in the United States with one of the largest collections of Italianate architecture of the 19th Century. Its historic district of Over-the-Rhine experienced an abrupt decline of its core but has managed to accommodate an urban renovation through bottom-up actions, as not being from the governmental.

Cincinnati is located in the Midwest region of the United States, in the State of Ohio, and borders with the states Kentucky and Indiana. Just as Bordeaux, it has also a river crossing the regional conurbation, called the Ohio River and the Ohio-Kentucky-Indiana (OKI) region, respectively.

In Cincinnati, specifically in the neighborhood of Over-the-Rhine, as a result of social and economic forces, for decade's people and businesses ended up leaving downtown resulting in continuous deterioration. Unlike Bordeaux, the revitalization of the Over-the-Rhine district was driven mostly by the private sector and the City of Cincinnati signed up as a partner, who provides tax incremental financing. The result of this partnership was the foundation of an institution called 3CDC (Cincinnati Center City Development Corporation). [8]

3CDC was responsible for two neighborhoods: the downtown Central Business District (CBD) and Over-the-Rhine. The historic district of Over-the-Rhine is located on the northern edge of Cincinnati's Central Business District and comprehends 100 blocks (362 acres) and is one of the largest and most intact 19th Century urban historic districts in the United States. Throughout its dense streetscapes full of tenements, churches, theatres, storefronts and social halls it is still possible to sense the almost unchanged landscaped molded by the first immigrants, mostly German, in the 1800s. Unlike other American historic districts, the originality of the neighborhood relies not on an impressive collection of mansions or unique architecture but on the fact that most of its architecture and landscape represents a diversity socio-economic classes mixed uses of its history. [9]

Over-the-Rhine was once one of the most densely occupied neighborhoods in America. Although the neighborhood was extremely diverse, there were an outstanding number of Germanic immigrants. Its magnificent public tenement stock, its rich brewing heritage and its important role in German-American history and nineteenth century immigration all make the neighborhood of national significance. [9] However, various factors at the beginning of the 20th Century contributed to the neighborhood's decline, and by the 1960's, it had become a poor, predominantly black and vacant area. From a population of 44,475 in the 1900 fell gradually to about 30,000 by the 1960s and a decade later it even shrank to half of it, composed by 5,380 African Americans, a newly significant minority in the neighborhood. [12] By 1990, the demographics had switched to a majority of 71% of 9,752 people being African Americans and more than a quarter of the area's apartments had become vacant and the rest was mostly occupied by low-income tenants, way below the city's economic figure. Crimes, street fights and prostitution were proliferated in this neglected area. [11]

One other feature of originality of this historic district is the evolving process of demolition of neglected buildings throughout the 20th century, as a standardized and reactionary approach. Unlike many other historic cities, Cincinnati has not capitalized on its historic assets. Since 1930, approximately half of the building stock has been removed, most of it by city-sponsored demolition. Between 2001 and 2006, over 50 historic buildings were demolished for being considered public threats. Today, many building stay vacant and in great need of repair, yet some building owners remain unwilling to bring their properties up to code. Once buildings reach a critical stage of dilapidation, they are deemed a danger to the public and are slated for “emergency demolition” by the city. [9]

The neighborhood was added to the National Register of Historic Places in 1983, with 943 contributing buildings. [10] In 2006, due to the national significance of the architecture and its threat of destruction, the neighborhood was placed on the National Trust of Historic Preservation’s list of the “Eleven Most Endangered Historic Places in America”. [9]

Fig. 3: Urban fabric of the Cincinnati’s Historic District of Over-the-Rhine in 1930

Fig. 4: Demolished building of the Cincinnati’s Historic District of Over-the-Rhine since 1930

The central and historic neighborhood of Over-the-Rhine experienced years of inner city decay, poverty, white flight, increased crime, population decline, lack of traditional employment opportunities and a shrinking tax base, since the 1960’s, after much of the older urban housing stock downtown was replaced by subsidized housing projects as well as by the construction of an interstate. The central and historic neighborhood was neglected over the decades till the 1990’s, when it started to show signs of life as many artists and entrepreneurs embraced the bohemian lifestyle emerging. However, in 2001 the killing of an unarmed black teenager by a white police officer and ensuing race riots abruptly interrupted the renovation that was on transit, which represented more than 600 people being arrested in less than a week, a total cost estimated at \$13.7 million and a number of business were unable to reopen for weeks and months afterwards. [11]

In 2000, the city began a comprehensive master neighborhood plan for Over-the-Rhine that advocated mixed-income housing, entrepreneurship, and preservation/rehabilitation of prominent civic institutions to return the area to productive use. Two thousand housing units were proposed, including a combination of rehab projects and new construction on 300 vacant lots. All stakeholders – residents, business owners, CDCs (Community Development Corporation), and faith based and social service organization – in the neighborhood have been invited to participate in this planning process. Most recently, the Urban Living Loan Fund was established for new housing in Over-the-Rhine and downtown Cincinnati. Seven area banks, the city of Cincinnati, and local foundations have contributed to the fund, which provides loans for rental projects, condominiums, and new home construction. [13]

In 2002, the Center City Plan conceived by consultants as a report to the city’s Economic Development Task Force, laying out a vision and a way forward for the city to begin restoring the vitality of its largest economic center. The task force made 23 recommendations, including the creation of a one-stop permit shop, establishment of the Port Authority as an economic development agency, and the formation of the Cincinnati Center City development Corporation (3CDC). [13]

The catalyst for change came in 2003 when 3CDC - a private, nonprofit development group – was formed. Funded mostly by corporate contributions, it has the exclusive reigns to spearhead the development of both areas. 3CDC was formed by a former mayor of Cincinnati and other corporate community members as a result of a recommendation by the City of Cincinnati Economic

Development Task Force. Since its implementation, there has been an expansion of development and the crime rates have significantly decreased.

In 2004, 3CDC accepted responsibility for overseeing Cincinnati New Markets Fund and Cincinnati Equity Fund. Working together with the City of Cincinnati, the State of Ohio and members of Cincinnati's corporate community, 3CDC is committed to redeveloping and investing in Cincinnati's urban core. Amongst their main goals are: to create great civic spaces, high density/mixed-use development, diverse, mixed-income neighborhoods supported by local businesses and to preserve historic structures and improve streetscapes. [8]

The institution comprehends the functions of a master developer in targeted redevelopments, providing strategic and long-range planning, and of a lender/fund manager, acting like a bank and managing private funds to developers. 3CDC has undertaken the construction of 200 condominiums, 70 rental units and 100,000 square feet of commercial space as part of a public-private effort to revitalize the oldest neighborhood of the city. According to its Chief Executive Officer Stephen G. Leeper, the entrepreneur is viable through substantial corporate support, not limited to operating funds but also for capital funding. [13]

Fig. 5: 3CDC's boundary of action in the Historic District of Over-the-Rhine

Fig. 6: Cincinnati's Historic District of Over-the-Rhine

City officials and 3CDC were tasked with making the goals laid out in the Center City Plan a reality. The plan detailed four initiatives aimed at restoring vitality in particular: [13]

- Redevelopment of Fountain Square: The plan recommended that the city, "transform Fountain Square into the city's retail, cultural and civic heart".
- Revitalization of Over-the-Rhine: With regards to Over-the-Rhine the plan said, ***"Without intensive focus on Over-the-Rhine, efforts in the center city will be wasted."*** Starting with a focus on the Vine Street corridor as the primary retail corridor, the plan envisioned a catalytic development agency spurring redevelopment along Vine Street in the historic neighborhood. The plan was to start at Central Parkway and work north towards Liberty Street.
- Restoration of Washington Park in Over-the-Rhine: It is the main focal point of the neighborhood. It was recommended that the city, "Implement a comprehensive development strategy to make Washington Park a civic treasure." The park is now restored and 3CDC still manages this park and the Fountain Square, promoting events and regular activities to attract people and keep the money rotating in the area. [13]

In general terms, the main actors involved in the revitalization of historic district areas can be classified as: downtown property owners and merchants, local government leaders, lenders, professionals, community groups, residents and the media. [2] In the case of Cincinnati, the first and the ongoing impulse came from private sector, reuniting corporation that have great interest in the area, such as the headquarters of P&G, Macy's and Kroeger, but it also find strength in less financial powerful institutions and grassroots movements. The big range of existing nonprofit organizations in

the neighborhood also contributes to the revitalization of Over-the-Rhine. It seems that after so many past mistakes and attempts to promote equality and preserve the built environment of Over-the-Rhine, Cincinnati's residents and advocates decided to take it by their own hands. Even though the resurgence of the neighborhood's vitality is not as bottom-up as during the 1990s grassroots movements (just before the riots of 2001), some nonprofits are following the premise that if you want to be done you need to "do it yourself".

Following is listed some of the main nonprofits and organizations acting in the redevelopment of Over-the-Rhine:

- Over-the-Rhine Foundation: works with the public awareness and education of the importance of historic preservation and why to preserve the neighborhood, actual preservation and redevelopment strategies along with the public realm and community's partners, protective actions through oversight of properties, and promotion of events and attractiveness to the area. [9]
- Over-the-Rhine Chamber of Commerce: representing the main businesses of the neighborhood.
- Over-the-Rhine Community Housing: formed in 2006 by the merger of two organizations supporting affordable housing.
- Drop Inn Center and Mercy Health Saint John: a homeless shelter which offers chemical dependency treatment and an agency that offers comprehensive social service, respectively.
- Brewery District Community Urban Redevelopment Corporation: works to develop the northern half of the neighborhood, emphasizing on Over-the-Rhine's brewing heritage and the mixed-use neighborhood created by use of the nineteenth-century brewery building stock.
- Over-the-Rhine Community Council: since 1970, it has represented the interests of residents and partnered with other organizations in service to the neighborhood. [13]

1.3 Conclusions

In both cases is quite evident the success of each of the endeavors so the focus is in how each one of these two cities has managed to accommodate the revitalization and modernization processes. Even though they differ in their priorities, both of the cases prove the point that highly focused leaderships and capital can solve most of the problems.

Tracing the paths of both institutions, in practical terms, InCité and 3CDC have many similarities in how they have accomplished the successful initiatives of implementing change and revitalization of the focused historic districts. The two cities also share similarities in their past of deterioration of the historic urban cores and in the time frame that the redevelopment processes were placed. However, the contexts these two institutions are embedded in, such as the structures of government and power, the demographic dynamics and the priority of the different goals are so different that is even hard to define a comparable matrix in order to provide precise conclusions.

Both institutions and approaches share similar goals for the improvement of the conditions of these two historic districts, especially in providing vibrancy and vitality in their domains. Nevertheless, the priority of each one these goals and the nature of the funding to implement these goals seem to be determining in defining what it is of the most public interest. Both entities have been victims of great local criticism due to the new social dynamics that have taken place in the historic districts. Due to market forces, the institutions have been accused of being responsible for the gentrification of the two areas (concept used here as the displacement of original low-income residents due to market value aggregation).

By history, the concept of public interest in France is very strong, and the State provides plenty of tools in order to apply what they define as common good and of the most priority in long-terms. For this reason, private properties are subjected to public interventions, especially if they do not achieve their social purpose. This is also true concerning the historic preservation in France. There is already a consolidated culture and conscious of the importance of a city's heritage that comes with plenty of tools and urban policies concerning the issue. At the same time, there seems to be a lack of community input and participation or even spontaneity, due to the residents reliance on the consolidated and strong central power. Even though public audiences and the community participation are under InCité's scope of action, comparing to Cincinnati, advocacy manifestations are less notable.

On the other hand, Cincinnati still struggles in finding its path to an effective historic preservation policy and way of action in the consolidated culture of the private property. Some of the non-profits institutions acting in Over-the-Rhine invest most of their initiatives in education and public awareness (of the population and even of the local power) concerning the neighborhood's built environment relevance in the city's history and identity and why it should be preserved. However, the local power's weakness in efficiently implementing itself the preservation and modernization of its built heritage gives great opportunities to grassroots movements and greater mediation from the market and real estate dynamics. In addition, the lack of a central guidance with a long-term visions allows that parking garage buildings, for example, to be still possible in historic districts like Over-the-Rhine.

Bordeaux dealt with more defined issue: vacancy, insalubrious housing conditions, deterioration of historic buildings, unattractiveness of its core and low-income housing in unlivable conditions. The social dynamics behind the issues within its historic district were primordially related to the population's income. On the other hand, in Cincinnati, the scenario includes the income inequality of the space distribution and conditions, but also racial segregation. The past decisions of allocation of resources and people, and the difficulty in matching the criteria of public grants concerning social and public housing, seem to be still on the way of Cincinnati's path to equitable urban spaces.

Taking in consideration the best-practices of both cases, it is evident that, instead of choosing one approach over the other, a balanced model of governance should be envisioned. On the one hand, top-down approaches provide the long-term vision and tools to make sure the collective good is being considered in each endeavor. On the other hand, private sector initiatives, grassroots movements and community's inputs are sometimes more efficient and everlasting than imposed initiatives. However, without the balanced combination of the elements of the community's input and a global approach, also controlling the market place to ensure that all residents and actors co-inhabit historic districts in equitable terms, individual efforts can pass by without being noticed.

Palazzo Marziani in Furnari. Project of restoration and reuse

Alessandra MANIACI, Caterina GULLO

Università Mediterranea di Reggio Calabria. Reggio Calabria, Italy

Alessandra.maniaci@unirc.it; gullo.caterina@virgilio.it

Abstract

The apartment block of Martiani's family that is dated 1961, construction work began on the principles, that in 1838 it will give to Mr. Natale Jannelli, since the building had a succession of owners, who neglected, and after the earthquake of 1978 left it completely. The palace is a longitudinal plan with the main entrance in the north side and the secondary at south: it consists in a double building, which extends for 42 meters on the way of the offices and for 14 mt on the present Piazza Garibaldi. The building has three levels, the underground floor used like store house, and covered with vaults of stone and earthenware, the others two floors with wooden roof vaulted made by "cannuciati", all the wall is in brick and stone with a size of 12- 50 cm. The three floors are connected by a system of stone steps covered with barrel vaults made of thin bricks of 25 cm long at Roman style, arranged in longitudinal rows and with cross vaults made by the same bricks. The pitched roof is composed of trusses with Monaco, with warping related at the Lombard period. In the three prospects of our building there is no sign of any symmetry: the main facade is subdivided vertically into two parts which demonstrate the begin of a renovation work, that is never completed, confirmed by the different types of eaves and balconies. The frames are carved in stone of Syracuse (MELILLI) and were transported by a ship landed on the beach of Tonnarella, while the main portal is made by tuff. The secondary facade, is finished with frame of brick, being at a higher level than the main facade, it has only two floors. The project of restoration and reuse concern in the construction of a shelter for battered women. The objective of the halfway house is to overcome the trauma and the construction of new possibilities of life, the rediscovery of its resources and capabilities. In the houses are greeted with the mother even minor children, of the women that had suffered the violence, both the children having witnessed the violence both who had suffered it directly.

Furnari

The origin of the name, derives from the Latin Furnaris arx or rather Fortitude of Furnari (last name of Sicilian origin). The name of the family Furnari derives in turn from the Greek Phournares baker. The Commune of Furnari extends him on a surface of 1.300 hectares, with a density of 269 inhabitants for square kilometer. It rises on a hilly zone from the "Mountain the Crosses" (247 ms s.l.m.), doing part of the mountainous chain of the Peloritani, reaching the Tyrrhenian Sea. It confines to east with Mazzarrà Sant'Andrea, to west with Falcon, southeast with Tripi, and southwest with Thermal baths Vigliatore. The town territory is suddivisibile in Furnari "hill" or "center" and Furnari "harbor." Furnari "harbor", ago head to the bathing fraction of Tonnarella, to Portorosa and the Region of Bazia, of Saiatine and of Strong Tower.

On the origins of Furnari the news is uncertain and controversial. The most shared version from historians and reporters is that of a Genoese merchant, some Phillip Furnari, that, come to the succession of Fred II° (directed to pick up the inheritance of the kingdom of Sicily), you/he/she had had, in reward of the lent services, the title of Baron and the possession of a quadrilateral of ground of 1279 hectares, today bordering with the communes of Thermal baths Vigliatore, Mazzarrà S. To. , Tripi, Falcon and the sea. Phillip Furnari was built the castle on a rock to the limit of a precipice; nearby to it, and then downward, poor houses of farmers rose: a suburb that taken the name de feudatario: Furnari.

Fig.1: Sees panning of Furnari (Me)

In the castle (on whose ruins you/he/she was built in the sec. XVI L' actual Church Matrix) King Pietro I° of Aragon sojourned you: Furnari in fact it was from the part of the Aragonese ones after having lifted against the Angiolinis in the war of the Evening. For such motive, after the victory on French, King Pietro Di Aragon recognized the barony to the family Furnari and reinstated her the whole possession of the territory, that was kept for over four centuries. In such weary of time the reported news to the country is thin if those are accented of general character concerning the whole zone in Messina: certainly it is that the barons Furnaris knew how to manage with the politics if, in the billows of the epoch, you/they could preserve their feud.

In 1538 the country as others of the province in Messina, were destroyed at the Spanish mercenaries of Charles V°, which, being himself/herself/itself mutineers for no to have received the pay, threw him to the conquest of the countries of the band tirrenica putting them to iron and fire. the inhabited area of Furnari that then it counted 138 families and 691 inhabitants, it was in a lot of part destroyed, ransacking and depriving of well 400 corpses of wheat guarded in the houses. It owed tarscorrere one century because the inhabited center could restore to health the wounds and in 1600 it already counted 229 houses and 845 inhabitants and, at the same time, the barony of the family Furnari turned him into dukedom. In 1691 the Furnari sold the earth to Joseph Marziani whose brother Anthony, succeeded later him the year, you/he/she had from king Carlo II° the title of Prince and the recognition of the possession that the family preserved up to 1813 when the Sicilian parliament abolished the feudal rights and Furnari it began its life of commune.

Building Martian to Furnari (Me)

The Building of residence of the Principles Martian it constituted the terminal part of a compartment built in 1961 by the principles.

This was formed from the convent of the Carmelitani, the church of S. Antonio di Padova, from the theater and from the residence of the Principles themselves. The zone destined to the Convent by what remains

from the few preserved documents he/she introduced a separated prospectus on two levels abandoned on a plinth in stone. To plain earth there was a portico with arcs to everything sixth that sustained a gallery on which you/they opened windows corresponding to the center of every arc. The church that was magnified in 1817, the saint in Padua is devoted to for the devotion of the family Martian and introduces a' only aisle with trusses coverage and in prospectus a graven portal in stone Melilli. Proceeding toward south we find the theater, that was boast of the whole country the construction it goes up again as that some whole compartment at the end of the 1700. From the tradition it is learned that the principles turned one store of theirs into the theater, equipping him/it with 600 places around.

1)Building Marziani

2) Chiesa della Madonna del Carmine

The Carmelitani for ancient tradition built his/her own convents in of the high ground to recall the Carmelo Mountain and in the tall hilly zone of Furnari, for the interest of the Family Furnari, they built the Convent, in a zone, already consecrate to the Mystery of the incarnation; in fact since the year 1000-1100 there were a chapel in Arabic style with real time, where a representing table was revered the Virgo Annunziata and seems, has been to Furnari the first place of cult devoted to the Madonna, that watched over on the small inhabited center from the hill. This chapel, still existing, it is found among the church and the bell tower. The actual church and the convent (today Town Building) were built to depart of the 1547. The monks brought the devotion to Furnari to the Madonna of the Carmelo. In 1930 the Genoese pastor got from the Italian State the trust of the church to the Arcipretura and some attached rooms to the church and the Madonna of the Carmelo, you/he/she returned to in procession to be brought for the streets of the country. The inside preserve works of art of great interest as: a cloth on the greatest altar devoted to the Madonna and the devotion of the Carmelo, to form of trittico, of the school of Thomas De Eve, of the second halves 1500.

3) Teatro comunale e

4) Chiesa di Sant'Antonio

You was built in the XVII century from the Principles Mariziani, that turned into the theater a spacious adjoining store to their building. Widened and embellished in the XVIII century, the theater has a capacity of 500 places, with two files of stages in wood, gallery, stage and ample stage. In the place where the church currently rises, around 1400 a small chapel was built then turned into the church at the end of the 1500. In the chapel a representing shovel the Saint preserved him, replaced in 1500 with a statue in wood of ulivo, what time it preserves him in the Mother Church. The church is to an only aisle; on the greatest altar a wooden statue of the Saint of good invoice towers, with conventual Franciscan suit, elegant in the features and in the gait. The work is attributed to a certain "De Matteo from Well of Mug" of the 1836. It is also his/her work the statue of the Madonna of the Carmelo.

5) Chiesa Madre

6) Chiesa Gesù e Maria

In 1375 the castle was built under the barony of Biagio Furnari. Inside the castle (where subsequently the actual bell tower was built), there was a small chapel in Arabic style devoted Caterina in Alexandria to Saint. Toward the end of 1500 in the part of the castle destroyed by the Saracens a greater church you/he/she was built. Among the present works of art in the church they are to remember: a statue of the Ecce Homo, work of "Frà Innocenzo from Pietralia"; a cloth of St. Francis of very alike Paola to the portrait of the preserved Saint to Paola; a representing cloth "You Pity" with the Souls of the Purgatory, positioned on an altar; a cloth of the Madonna of the Rosary, work of Rosalia Novelli, in which the Virgo softly sits on a roseto holding in arm Jesus Bambino and the Crown of the rosary that it gives to St. Domenico surrounded by St. Thomas of Aquino, Saint Rosalia from Palermo and Sant'Antonio from Padova; a wooden statue of Sant'Antonio from Padua, going up again to the beginnings of the '400, that it is the first statue of Sant'Antonio revered to Furnari, and later replaced with the actual one in 1836; a reeds organ, going up again to the 1637 of good invoice; and finally a shovel of the Madonna of the Help.

The apartment block of Martian' s family that is dated 1961, construction work began on the principles, that in 1838 it will give to Mr. Natale Jannelli, since the building had a succession of owners, who neglected, and after the earthquake of 1978 left it completely. The palace is a longitudinal plan with the main entrance in the north side and the secondary at south: it consists in a double building, which extends for 42 meters on the way of the offices and for 14 mt on the present Piazza Garibaldi. The building has three levels, the underground floor used like store house, and covered with vaults of stone and earthenware, the others two floors with wooden roof vaulted made by "cannuciati", all the wall is in brick and stone with a size of 12- 50 cm. GREATER AMMAN: METROPOLITAN GROWTH AND SCENARIOS FOR SUSTAINABLE URBAN DEVELOPMENT

Ahmed ABU AL HAIJA¹, Rob POTTER²

¹ Deanship of Educational Services – Taibah University

² Human and Environmental Sciences, University of Reading

E-mail: alhaija2@gmail.com r.b.potter@reading.ac.uk

Abstract

This paper reviews the development of Greater Amman, Jordan noting that the vast urban expansion that has occurred over the last fifty years has led to the desertification of rare fertile lands, following the fragmented and scattered territorial expansion of the city. The future scenario for planning in Greater Amman is analyzed in respect of proposals outlined in the *Metropolitan Growth Plan* of 2008, which assumes a rapid population growth from 2,200,000 persons in 2006, to approximately 6,500,000 by 2025. The concentration of more than 39 per cent of the national population of Jordan in Greater Amman threatens the transformation of former distinct settlement pattern into a distinctive continuous urban zone, aggravating problems of infrastructural provision, water needs, agricultural lands, and leaving unresolved problems of land inflation, poor urban standards and housing shortages. In conclusion, the environmental implications of the *Amman Metropolitan Growth Plan* are analysed, and it is suggested that an alternative approach is needed, based on clear principles of sustainable urban development.

Keywords: Amman, Urban Growth, Agricultural Lands, Potable Water, Public Standards, Site and Services

Introduction

No one can deny that architecture is generally influenced by the environmental context from which it is derived, including climatic, social, cultural and economic factors. In Arab history, the urban and architectural output was often a mirror of environmental exigencies. Nevertheless, it has given rise to both modest and complicated structures. The introduction of innovative urban and building systems followed by industrial development was essential for the birth of the Functional Schools in the 19th century, followed by the Modern Architectural movement. It also spread in Arab cities such as Amman, Jordan, where the conceptual focus was more on functional and economic issues rather than environmental and traditional ones.

This paper focuses on the phenomenal urban expansion of Amman over the last century, covering the various waves of urban development in relation to international political events. In fact, in its short modern history, Jordan has played an important role in the Middle East region, accommodating millions of Arab refugees, mainly Palestinians in the last century and Iraqis since 2003. Important 'modern' cities such as Amman and Zarka were settled in less than 70 years in the north of the country, and now these cities account for more than 50 per cent of the total Jordanian population, with fast approaching 3,000,000 residents (Statistical Department of Jordan, 2009). The shortage of natural resources in Jordan, compared to some other oil regions, encourages the central government to implement macro-economic programs, inviting private and international investors to contribute to the development of the local economy. The political stability of Jordan has been a fundamental factor of Arab investment attractions, especially in the industrial and tourism sectors. Tourism contributes US\$ 14,190 million to Jordan's economy and accounted for 14.7 per cent (compared with only 10 per cent in 2004) of the country's gross domestic product (GDP) in 2008 (Statistical Department of Jordan, 2009). The capital of Jordan's infrastructure is gradually developing to be competitive with the regional countries, with the expansion of Queen Alia International Airport and improving the transit links, network connections and main services for trade and tourism purposes.

Until 2005, urban planning in Amman adopted a pattern of urban expansion based on low-density urban sprawl, permitting a maximum height of four residential floors, with site coverage less than 50 per cent (GIS, 2010). The presence of refugee camps, high-density residential zones and some slum quarters located mainly in the southern and eastern parts of the city has contributed to the division the city into two vast zones as previously mentioned: western Amman and Eastern Amman. The process of rapid horizontal expansion of the city has increased the surfaces of the prime infrastructural intervention amplifying land costs, and causing environmental impacts at the biophysical scale. Therefore, there is a danger that losses to biodiversity resulting from these activities could reduce the resilience of ecosystems to withstand climatic variations and their pollution damage (United Nations, 1992). In fact, the diminution of precipitation in Amman in the last 25 years has been recorded at more than 10 per cent (Salameh, 2008).

On the other hand, Amman has experienced a regime of water rationing since 1987, with households receiving water once or twice a week for various durations: "this reflects the fact that Jordan is one of the ten most water-scarce on earth and has long suffered from a structural crisis in the water sector" (Potter and Darmame, 2010: 116). The water supply depends on availability within an area of hundreds of kilometers around Amman, causing an impact at the biophysical scale. In fact: "Amman's use of the Azraq wetland as a ready resource of potable water has destroyed over 90 percent of the nation's most biologically diverse wetland ecosystem" (Greater Amman Municipality, 2008: 53). Therefore, the vast spatial extension of Greater Amman has led to many problems, mainly at the infrastructural and environmental levels.

Approach

Unfortunately, to date there has been a shortage of relevant research on issues relating to principles of sustainable development in respect of Greater Amman. Critical aspects such as the basic infrastructure of the city, public transportation, local resources, urban densities and housing requirements need to be carefully examined and evaluated. The present paper investigates the impact of urban expansion on the environment, employing available data supplied by a number of Jordanian Public Departments, plus data collected personally with the collaboration of some technical staff working in the Greater Amman Municipality. Most of the updated urban analyses were available in the Greater Amman Municipality, as elaborated in the *Metropolitan Growth Plan of 2008*. Therefore, the authors faced problems of data availability regarding particularly traffic analyses between the various zones (origin – destination traffic, for example), the ownership of lands, the surface of lands organized

(built up and new areas) according to the various residential classification in order to evaluate the existing building capacity.

The first section of the paper examines the urban development process over the last 50 years, highlighting particularly the urban expansion adopted by the recent Metropolitan Growth Plan of Amman, which involves an unconventional approach to planning; it elaborates simultaneously a framework of three hierarchical scales: Metropolitan, Planning area and Community-neighborhood. The first section also analyses the process of urban expansion, which has occurred mainly in the northern and southern parts of the city, highlighting the housing needs, building capacity, natural heritage and water needs.

In the second section, reviewing the integrative approach of the *Metropolitan Growth Plan of Amman*, which is in continuous development until 2025, this research evaluates the possible consequences of the planning process, concerning some economic and political obstacles. Therefore, the purpose of this study is to suggest an alternative approach to planning in controlling the infrastructural costs, housing needs, agricultural land conservation and water management, taking into consideration community exigencies and public services. In the words of Moughtin (2005:1): "Any discussion of city planning and urban design, which does not address environmental issues, has little meaning at a time of increasing population pressures on a declining natural resources base, widespread ecological destruction, increasing pollution, ozone layer depletion and climate change.... The long-term survival of the planet as a vehicle for sustained human occupation in anything other than a degraded lifestyle is in some doubt: in these circumstances any discussion of the aesthetic of the city planning in a pure or abstract form unrelated to the environmental concerns could be described as superficial"

The Historical Development of Amman

The recent modern history of Amman started at the end of the 19th century by the settlement of around 2,000 Circassian people (Ziadeen, 2004) escaping from Russia due to socio-political problems. This agricultural community established the historic core, benefiting from the rich soil and water, at the confluence of valleys around the Roman Archeological site in the valley of Ras El Ein (about 600 meters in altitude). Neighborhoods were established on separate hills where new arterial roads connect the urban fabric, following its natural topography (valleys toward hilltops). These neighborhoods have expanded occupying seven hills around Ras el Ein (between 600 and 1,100 in altitude).

The population began to increase gradually after the completion of the Ottoman Hijaz Railway in 1902 (which passes close to Amman's old center and connects Damascus and Medina in Saudi Arabia) and after the foundation of the Municipality of Amman in 1921. In 1946 Amman occupied an area of 31 square kilometers and had a population of 60,000 persons. Several waves of refugees, mostly Palestinians, settled in Amman in the years 1948 and 1967. By 1959, the boundary of the Municipality had expanded to include 50 square kilometers and the population had increased to 246,475 persons (Greater Amman Municipality, 1986). Since that time, several boundary expansions have continued following waves of refugees, as well as asylum-seekers from the wars in Lebanon and Iraq, reflecting the fact that Jordan plays a moderating role in Middle Eastern affairs.

A policy of centralization has been accentuated since 1987 within the creation of the Greater Amman Municipality (GAM), governed by a Mayor nominated directly by the King of Jordan. The new Metropolitan area encompasses 532 square kilometers. Subsequent boundary expansions in 2000, 2001, and 2005 increased the total GAM land area to approximately 680 square kilometers, and the population of Greater Amman had grown to approximately 2,200,000 persons by 2004. In 2006 GAM's geographic boundary increased from 680 to 1,662 square kilometers, thereby annexing the former municipalities of Sahab, Al Mouwaqer, Al Jeeza, Marj Al Hamam and Na'our. In this way, an additional 190,000 residents were absorbed into the city (Greater Amman Municipality, 2008: 47).

Legislation and Urban Planning for Greater Amman

The most important *Master Plan of Amman* was funded by USAID (the United States Agency for International Development) and was largely produced with the involvement of English Planning Consultants. A *Greater Amman Comprehensive Development Plan* (GACDP) 1988-2005 enlarged the border of the municipality to include small agglomerations around Amman with a total surface of 532km². The main objective of this plan was essentially to control urban growth in terms of land speculation managed by land owners and the local councils which increased the urbanized areas in agricultural lands, in order to increase profits derived from the cost of lands and urbanization. The

Plan established the norm of a maximum of four stories in residential areas, which is a reasonable maximum building height because on this basis most activities can be accommodated without the need to provide a lift.

The Plan suggested that urban expansion, especially of residential areas, should occur toward the desert east, where the population density is at its highest, as this zone includes slum areas to a greater degree than any other place in the city. Several residential areas in the eastern zone suffer also a shortage of open spaces except within some scattered vacant private lots. But in practice, development followed the opposite directions towards the agricultural lands (see figure 1) (Abu Al Haija, 1995). In fact, a report on the *Growth Plan* (Greater Amman Municipality, 2008: 144) states: "The plan of 1988 included several green areas such as parks, forests, recreation areas and agricultural land within an overall system, unfortunately, the Plan was not implemented and the creation and protection of such a system did not occur".

Figure 1. Ring Roads Plan of 1988

Thus, the Plan failed to limit sprawl and to preserve prime agricultural lands: instead, the urbanized areas increased to meet housing needs, permitting expansion in almost all the agricultural lands located to the west and south of Amman. The contradiction of this plan, was that while proposing residential land use in the east, it designated and implemented new primary and ring roads in the north and south-west of the city, encouraging residential expansion in these directions, where the areas were mostly used as agricultural lands. The main report of the *Amman Growth Plan* evaluates the 1988 plan, stating that the Plan was indeed comprehensive, being based on over four years of detailed research and analyses. Therefore, it remains a significant resource for the ongoing planning of the city and its surroundings: "However, little attention was paid to either the political acceptance of its enactment and, as a result, it was never formally adopted. Consequently, planning in Amman has continued to be governed by the city's outdated zoning bylaws, overlaid on its emerging ring and radial road network" (Greater Amman Municipality, 2008: 46)

From 2006 a largely neo-liberal approach to planning in Amman was increasingly adopted. This has been based on intensifying the building density in some old built-up zones, and attracting international funds, partly by taking advantage of Jordan's reputation for safety within the region. The Al Abdali Urban Regeneration Project in Amman is an example of the outcome of the new approach to planning, as the central government gave the private real estate developers the right to be in charge of implementing macro-scale projects within the city. This project will provide a new center for finance and commerce within the city, consisting of hotels, markets, offices, entertainment services and residences. The total area is 350,000 m², which will contain a built-up zone of approximately 1,000,000 m² in a site previously used as the General Quarter of the Armed Forces, about 1,500m away from the old center. The policy of privatizing public areas inside Amman is similar to the experience of *Solider* private society in the reconstruction of the old center of Beirut, from an organizational point of view. *Solider* was established after the destruction of the historic center of Beirut in 1982. The Lebanese Government decided to transform the properties into shares, where the private sector control the process of reconstruction and management according to a neo-liberal agenda of privatization (Daher, 2007: 49)

But several important reflections exist concerning high-rise buildings in view of the existing capacity of infrastructure, and the adaptability of these buildings to local climatic conditions. Issues also exist regarding the local culture of the people with particular attention to matters of privacy, and how these buildings respond to the principles of energy saving and water needs, and how they can be made consistent with the environment assessment law *Number 37* of 2005, which in theory forces architects and engineers to develop environmental studies and analysis for the evaluation of the impacts of projects.

As part of the International Conference organized by the Engineering Association of Jordan in 2008, under the title the *High-Rise Building in Amman*, a planner in charge at the office of Planning of the Amman Municipality recognized during the concluding debate that the Al Abdali Plan was oriented

mainly by political and economic choices, and that several problems are difficult to resolve by adopting technical solutions, such as the realization of towers in already high-trafficked areas. The high-rise building policy assumes importance, especially in the built-up zones. Therefore, since 2000 structures of more than 90 meters in height began to appear in Amman. In 2005 the Twin Towers project began in a high-density urban zone, each building reaching about 150 meters in height, covered completely by glass cladding systems, and occupying some 28,500m² of land.

The recent propensity to place high-rise buildings in chaotic and highly dense zones provokes other infrastructural and environmental problems, which evidences a serious crisis among decision-makers, in adopting a clear future vision of urban development and planning. Problems of traffic and congestion are becoming serious in all parts of Amman, particularly the shortage of pedestrian areas, with the motor car playing a dominant role in the context of the lack of overall an effective public transportation system.

The *Environmental Law Number 52* of 2006, and the norms of environmental assessment have together established general indications in the conservation of natural resources and in respect of the environmental context in project elaboration and implementation. According to these criteria, mainly concerning the traffic implications, high-rise buildings like those in the Al Abdali zone and other similar mixed areas, would find difficulties in being approved. The first concrete result of this law has been the enlargement of the Amman Municipality in the year 2006 to 680km², expanding the borders to protect mainly the agricultural lands. A new *Metropolitan Growth Plan* (MGP) was elaborated in 2008, which is the focus of the detailed case study that follows.

The Amman Metropolitan Growth Plan (MGP): a case study

The Planning Approach to Territorial Extension

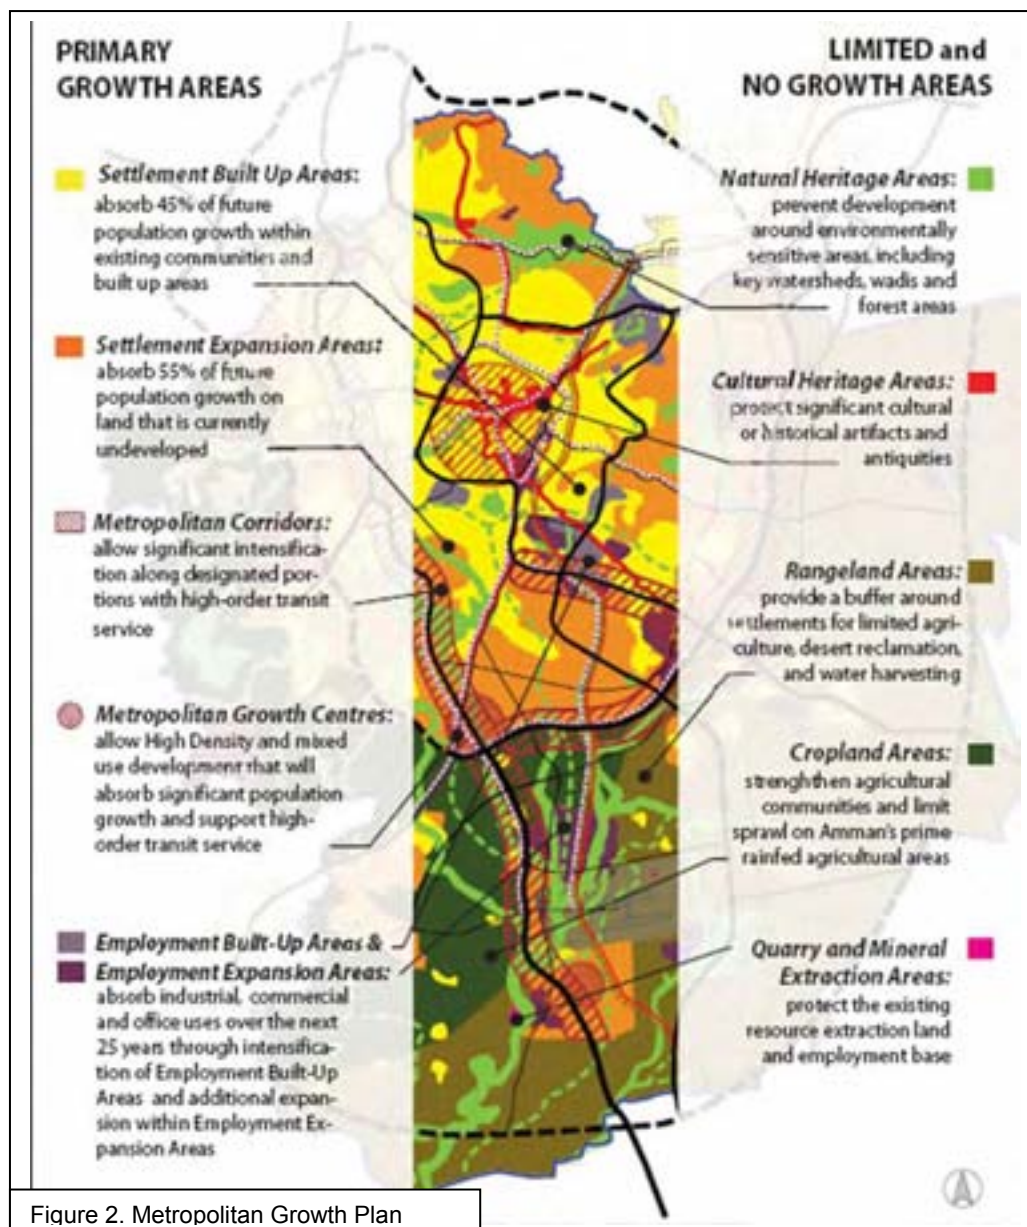

The absence of an adopted and implemented Master Urban Plan for several years and the rapid growth of population called out for a rapid and well-articulated response. The classic procedures associated with the preparation of Master Plans normally requires a long period of technical elaboration and administrative measures for final approval, while the city is quickly expanding. The *Metropolitan Growth Plan* (MPG) for Amman has been presented as a response to these requirements. It is structured at several scales simultaneously in order to guide the planning process for an anticipated population growth of Greater Amman to 6,500,000 persons in 2025. The plan illustrates the location of existing areas accommodating residential and employment uses within the overall Metropolitan Area, as well as the preferred locations for the future expansion of settlement. It also details the projected future locations of new roads, public transit corridors, major natural heritage sites, and areas for more intensive mixed-use development. The plan has been developed according to different layers throughout its duration. Thus, the approval of this Plan also follows the ongoing development of these layers (Greater Amman Municipality, 2008). This “work in progress” plan is divided into three hierarchal scales:

- The Metropolitan scale: relating to 1,662-square-kilometre planning area (Figure 2)
- The Planning Area scale: the Metropolitan zone is divided into eight planning areas to provide a finer scale of planning. Area Plans, when completed, will be based on the Metropolitan Growth Plan and will include elements such as land use and major road alignments.
- The Community scale: this occurs at the level of the 228 existing neighborhoods, and will cover details of zoning and the road network.

The *Master Plan* is being developed in seven planning phases that define a range of Plan Components. These components are: the Plan for tall Buildings, the Corridor Intensification Strategy, the Industrial Lands Policy, the Outlying Settlements Policy, the Airport Corridor Plan, the Metropolitan Growth Plan, Area Plans and Planning Initiatives. The following paragraphs mainly deal with the Metropolitan Growth Plan and related issues of planning densities.

The Approach to Urban Expansion

The Plan establishes the areas designated for future settlement growth, including the intensification of settlements within existing built-up areas and the overall expansion of settlements. Based on data from the Statistical Department of 2007, the Metropolitan Growth Plan (MGP) considers the minimum number of new dwelling units needed by 2025 to be approximately 1,300,000. This figure, of course, relates directly to the population growth which is projected to increase from 2,200,000 to 6,500,000 persons by 2052.

The growth framework proposed in order to meet the demand for land and housing is based on the following components:

The Designation of Built-up Areas:

Tacking into consideration the fact that up to 40 per cent of lands within Amman's built-up area are vacant (according to the Greater Amman Survey, 2008) the MGP proposes growth through both intensification and densification. The plan proposes to accommodate 55 per cent of new housing units within the built-up area, which it calls the "Urban Envelope".

The Designation of Settlement Expansion Areas and the Urban Envelope

Areas for settlement expansion are mainly located within the so-called "Urban Envelope". Only low-density housing development is allowed for future growth outside the Urban Envelope, estimated at some 700,000 additional residents.

The Application of Growth Modelling from the Neighborhood to the Metropolitan scales

The MGP analyzed twenty sample neighborhoods in order to model neighborhood growth patterns before applying this to Amman's full array of 228 neighborhoods.

Density of Areas

These densities were varied among the built-up areas making-up the Urban Envelope, increasing the building capacity as part of the densification and intensification approach. Lower densities were encouraged outside of the Urban Envelope, especially in the main agricultural lands. Planning area A, for example, has a density target of 6.5 units/per net dunum, accommodating upwards of 1,300,000 residents, for a net density of 26.5 persons/dunum. Area H has a density target of 1.2 units/net dunum, accommodating upwards of 170,000 residents, for a net density of 5.5 persons/dunum.

The new densities established by the Plan are generalized by broad areas in order not to detail urban expansion at the macro-scale. Therefore, compared to the existing density in the north of Amman it is clear that a substantial reduction is required in some areas where the density is presently very high. Existing residential densities are classified into four main categories: A, B, C, D. The maximum built-up area that can be occupied is respectively 39 per cent, 45 percent, 51 percent and 55 percent of the lot's surface, with a maximum of 4 floors (15m height) (Urban Regulation, 2005, art. 29). Residential zones A and B are generally located in the north and west of Amman and the residential zones C and D are located in the east and south of the city.

In areas designated as residential (A) the lot's surface should be at least 1,000m². The building index is around 3.7 mc/mq considering the dunum surface plus 25 per cent of internal streets. This theoretical index is flexible according to the topography of land; the maximum 15 m height indicated by the norms are computed starting from the ground floor which stands on the level of the street. All the stories below this level are authorized but not calculated as part of the urban density, while, due to the topographic nature of Amman, the major part of residential buildings are more than 6 stories. In A areas the number of dwelling units per dunum can be approximately 12, considering the average surface of unit 120 m² and the average of person/family in Jordan is 5.4. In zone (D) the lot's surface should be at least 300m². The building index is about 5 mc/mq considering the dunum surface plus 25% of internal streets. The dwelling units per dunum in this area is approximately 17 considering the average surface of unit 120 m². In this case, the expansion areas should diminish more than 50 per cent.

Discussion: Observations on the Approach of the MGP to Expansion

The Loss of Fertile Lands

Three important issues continue to cause the diminution of fertile lands in Amman, and the first is the low density of building. About the 50 per cent of the proposed urban expansion is set to occur on fertile lands, mainly in the north, west and south of the city. Thus, the low-density pattern of building permits urban sprawl. The second issue concerns subdivision plans in rural areas. Residential development is set to continue expanding outside the built-up areas. In fact, new residential quarters can officially be approved outside the urbanized areas according to these Plans, which could be proposed even on prime agricultural areas. The third concerns the minimum parcel size of agricultural land. The Growth Plan recognizes that current residential subdivisions are negatively affecting agricultural productivity as they fragment the agricultural land base, and it mentioned the necessity to elaborate an Agricultural Plan which restrict residential growth in agricultural areas, by establishing regulations for minimum parcel sizes, and by establishing hard boundaries for settlement expansion in agricultural areas (Greater Amman Municipality, 2008, p. 92).

More than 55 per cent of the urbanized areas of Amman are vacant because the owners have left their lands abandoned (GIS, 2010). These are generally fertile lands, and the owners are waiting major offers from developers. The country's legislation continues to permit rural areas to be divided into smaller parcels – a minimum of 4000 m² of land property. This in turn causes limitations in adopting national agricultural policies in terms of production and marketing. Lands also continue to be divided into small portions because of the inheritance law and its consequences.

It is hard not to reach the conclusion that the Growth Plan should urgently prevent additional urban development on prime agricultural lands, possibly using the implementable agricultural belt in the northern and western parts of the city, and freezing the subdivision plans outside of the urbanized areas. The fertile lands of Amman represent an active part of conversion. According to studies conducted by Jordanian specialists in remote sensing and Geographic Information System, the urban areas of Amman have increased in the last 80 years by 509 times the original urban area, while the fertile lands decreased by 86 km², which represents an overall 23 per cent loss. Research concludes that fertile lands will disappear by the middle of the century if urban expansion continues at this rate in

Amman (Al Rawashdeh and Saleh, 2006: 215). For example, presently, the urban area comprises 91.4 per cent of the province of Amman (Statistical Department of Jordan, 2009).

With about three years having elapsed since the adoption of the MGP, it is interesting to return to a sentence cited in the main Report of the Plan (Greater Amman Municipality, 2008: 90), which states: "... the 1988 Plan was never implemented and urban growth occurred in ... agricultural areas". Therefore, the substantial problem of Amman's development concerns the inflation of land prices and the economic possibility of the municipality funding the expropriation of lands for public utilities. Consequently, the development policy should mainly take into consideration these problems in order to avoid other failed experiences, as the implementation success of these plans depends on how and where the new expansion is proposed.

According to agricultural land analyses conducted by the Municipality, approximately one in six households in both high and low-income areas grow their own fruit, vegetables and herbs. On average, these residents occupy up to 15 per cent of their land for urban agriculture, generating approximately JD 1,900,000 annually. Due to the high cost of vacant residential land in the urbanized areas of Amman (for example, the cost of a residential dunum in the north of Amman is about 250,000 - 500,000 JD), the Plan faces a real difficulty of the private owners changing these lands into urban agricultural areas, taking into consideration the limited resources of the municipality in supporting these owners to maintain or run their agricultural lands inside the city. Prioritizing agricultural use in vacant areas inside the city could be unfair, without taking into consideration holistic land policies.

The Standard of Public Services

In light of the shortage of analyses concerning the availability of public services in the city, the Metropolitan Growth Plan does not established specific technical norms for urban standards in the built-up area and the new expansion zones. Therefore all the areas of Amman are being urbanized without limitation of public standard services in relation to extant building densities or the number of residents. Therefore, primary schools, public gardens, sports areas, parking, social and religious buildings are distributed almost casually within the city, depending on public land ownership availability or private donations. The total land area for public service use in Amman is 6,655,086 m² (GIS Department, unpublished data - Greater Amman Municipality, 2010), which is only approximately 3 square meters for each resident.

Most of the land ownership in Amman is private (in fact, about 99 per cent according to the non-published database of the GIS Department in Greater Amman Municipality, 2010), therefore there is a shortage of public open spaces in general, except for some scattered vacant lots. Increasing the open spaces in the built-up areas of Amman or in the new development areas has become one of the biggest challenges facing the MGP.

Water Needs and Network Problems

Recent studies have shown that Amman has a drastic shortage of local aquifers to satisfy its demand for potable water. It receives around 50 per cent of its water supplies from the Jordan Valley, pumping from -225m in the Jordan Valley to the north-west of the city at an altitude of (1035m) (Potter *et al*, 2007). The remaining water demand is met from other aquifers, generally some 50-70km distant from Amman. Because of Amman's growing demand for potable water, and the Government's avowed intention to provide for the basic needs of the population as a priority, in 2009 the Government authorized the Turkish GAMA Energy Company to implement a project to transport 100 million cubic meters per year for the next 10 years of non-renewable water to the city from the Disi aquifer. This aquifer is located in the south of Jordan, and the project will involve the construction of a 325 km pipeline from Disi to Amman.

Most experts consider countries with a per capita water production below 1,000 cubic meters per year to be water-poor. Meanwhile, Jordan's per capita water for the year 2005 was only 146 m³ compared with 846 m³ for the rest of the Arab world (Hashemite Kingdome of Jordan, 2006: see also: UNESCO, 2006; Darmame and Potter, 2008). Accordingly, for most parts of the city, especially its southern areas, water is supplied only one day a week, while other residential quarters in the western area receive water two days a week. Residents store water in tanks or cisterns located mainly on the roofs of buildings. The urban expansion of Amman has, of course, increased the surface of the operational network and has added to the need for control and maintenance. Given the steps that are currently being taken in order to supply the extant population of just over 2 millions with water on the basis of a formal system of rationing, it is difficult to see how a population of some 6.5 millions as envisaged in the Plan could be kept adequately supplied with water at an acceptable cost by the year 2025.

An Alternative More Sustainable Scenario for the Future Development of Amman

The phenomenon of unlimited and largely uncontrolled urban expansion for over fifty years has characterized Greater Amman, which is consequently facing a range of problems relating to infrastructure and environmental sustainability. In short, the city of Amman is not in balance with its regional area and it can be argued that it is not in synergy with its local ecosystem and the natural environment.

Some key concepts of sustainable development need pressingly to be considered, such as citizen participation in relation of regional- and local-forms of governance, public transportation policies, site and services schemes, appropriate land use provision, urban densities, building orientation and form (see Elkin, 1991). The Jordanian Master Plans are principally concerned with the physical aspects of development, rather than with issues of metropolitan governance and local community participation. This is a characteristic that could well affect the sustainability of future urban development. The direct democratic election of Local Government representing Ammani citizens, thereby creating concrete instruments of citizen involvement in the planning process, could be a suitable approach leading to effective community participation. The local political coalition have to clarify the physical, economical and social programs with transparency, evidencing concrete actions of public participation. This would mean that "Human development (w)ould take account of nature and natural process" (Ettouny, 1987; see also Potter, 2010).

The urban planning system is still working at a restrictive local level using detailed plans not necessarily controlled by a comprehensive strategy. This urges that the MGP should have already the instruments to control urban development, in order to prevent the creation of any illegal buildings outside the urbanized lands or the approval of Subdivision Plans also on agricultural lands (due to the relatively low cost of land compared to the urbanized areas). This could also avoid the high-cost infrastructural networks due to rehabilitation programs in slum quarters that are continually developing in the periphery of Amman (Abu Al Haija, 2001).

Future urban expansion will occur mainly in the southern parts of the metropolitan area and will be fully contained within the designated Amman Development Corridor. This scenario confirms the tendency of urban expansion towards the agricultural lands, where the comfortable climate and panoramic natural views encourage settlement compared to the desert lands located to the east of Amman. The present paper suggests the efficacy of an alternative scenario with the main goal of alleviating environmental damage, especially in the fertile lands of Amman west, north and south, by orienting future urban growth mainly into the semi-desert zones of Amman east. This scenario has the following advantages associated with it:

- saving the fertile lands located in north, west and south Amman
- facilitating different policies and approaches to urban zoning, considering that vast land areas are not yet subdivided
- controlling urban densities in order to reduce the ecological footprint of the city
- reducing the cost of infrastructure (due to the topography)
- reducing the cost of building (due to the low cost of these lands compared to other zones in Amman (the average cost per dunum in the semi-desert zones is about 10000 – 100000 JD)
- reducing traffic densities in the western and northern parts of the city
- savings in energy by reducing the distances between programmed facilities and public transportation, so encouraging walking and cycling
- connecting the new growth area with the city of Zarka, through the existing highway, without passing through the dense areas of Amman

- permitting the maximum solar gain and energy efficiency, organizing roads and buildings according to prevailing climatic conditions, within appropriate orientation according to the path of the sun
- permitting the local community to take responsibility for initiatives, thereby increasing public participation in the planning process

The site and services approach has much to recommend it in the context of metropolitan Greater Amman, in order to assist with the improvement of low-income housing in Amman east. This approach can be dovetailed with the opening up of new peripheral urban lands as part of the overall approach to planning. Meanwhile in Amman north and Amman west there is currently a surplus of some 30,000 vacant residential apartments. This gap between housing needs and demand on the 'two sides' of Amman is essentially due to the social and economic standing of residents. For the majority who live in Amman east, with the average Ammani family earning only JD 576 per month, life is hard (Statistical Department of Jordan, 2009). And it is clear that the growth in incomes is not anywhere near keeping pace with current levels of inflation.

In the case of Egypt, new cities have been established in the last 30 years in the desert areas. These include Sadat City, Sitta October City and Al Asher Ramadan City, which are located between 25 to 100km from Cairo. These new towns have succeeded in reducing the pressure of urban growth on surrounding agricultural lands adjacent to the Nile, especially in the Cairo Metropolitan area. This policy has other advantages in planning and programming the future expansion taking into consideration relatively low-cost land, and the integration of residential, industrial and commercial land use zones (see Ettouney and Abdelkader, 1987).

The problems of urban planning in Amman continue to be critical in scale due the pattern of land ownership and the interests of private developers in shaping land development and land policies. Other substantial problems concern the cost of land, the pressing housing needs of low-income families, the various slum quarters scattered in several zones, the shortage of potable water, the dearth of public services and healthy apartments. In particular, within Amman there needs to be the realistic control of land costs. However, this is difficult to achieve within the framework provided by the present Metropolitan Growth Plan. In reality both the public and private sectors have to be involved in developing new autonomous and sustainable settlements, based on site and services approaches, the provision of good standards of primary public services and sustainable patterns of natural resource consumption in relation to future development directions and building densities.

The Challenge of Urban Sustainability in Seaside Cities Between Unlimited Growth and Serene Degrowth

Abstract

Seaside cities are a privileged laboratory to wonder about the fate of the modern metropolis and identify innovative development models. The crisis of the capitalistic system raises the question: Should we accept the system's constitutional limits and indulge its degrowth, as suggested by Serge Latouche, or try to face these limits to seek new end markets for an economy which seems to be literally plodding towards the post-industrial era? In an interdisciplinary approach which uses urban and philosophical contributions, the paper proposes to go back looking at the sea as a horizon still full of opportunities and considering the big cities rising on the coast as a possible epicentre of an innovative renewal movement. Traditionally, after all, seaside cities have always played a leading role in civilization's advancement. Let us consider cities like Athens, Venice, Amsterdam, New York. Nevertheless, despite acknowledging that the sea is an undeniable growth vector, philosophy urged us to look at it with a sort of circumspection, since the very development that it ensures hides degeneration elements. Taking into account such a problematic and complex perspective, we want to analyse urban development models which, initially applied to seaside neighbourhood, are able to spread to the rest of the city and that, even considering the current growth demand, are also able not to satisfy the risk factors by it implied.

Keywords: Seaside City, Growth vs Degrowth, Sustainability Redevelopment

1. Seaside city as a laboratory to experiment innovative sustainable approaches to urban development¹

«Despina can be reached in two ways: by ship or by camel. The city is different to those who come from the land and those from the sea»
(Italo Calvino, *Le città invisibili*)

The city is the place where all the contradictions of the contemporary age converge: overcrowding and depopulation, congestion and disuse, wealth and poverty, crisis and development, growth and degrowth. Especially in seaside cities, the shore line represents a kind of catalyzing agent, which get phenomena stronger and make them more visible and effective. Urban coastal areas are a privileged observatory. Looking at the city from the sea gives a chance to better understand the past. It gives more knowledge perspectives and may improve the future of our cities. This "maritime approach"

¹ This paper is an outcome of the research project of "Urban strategies for contemporary city: multiculturalism, identity, recovery and valorization" coordinated by Massimo Clemente. Within the unitary work of the research group, the following contribution can be individuated in the paper: the first section, has been carried out by Massimo Clemente, the second by Daniele Demarco and the third by Eleonora Giovane di Girasole. English Citations have been translated by the authors and the conclusions are shared by them all.

allows to combine different cultures and cognitive paths, especially the urban and philosophical ones. The sea is a recurring element in philosophy, from Plato to Aristotle, from Hegel to Schmitt. According to Aldo Rossi, the sea is the main urban element. It is both an idea and a dream. This case study approach arises from CNR's activities, which concern seaside cities as historically multicultural and multi-connected places. Looking at the seaside city "from" the sea, in other words, through the filter of maritime culture, is the basis of our research. Throughout history, maritime routes have connected cities all over the world, fostering the encounter-clash between different peoples and cultures. Seaside cities became, thus, cultural melting pots, the backdrop to different life stories, different individuals, expressed and reflected in the materiality and spatiality of architectures and urban spaces.

A kaleidoscopic reality, perfectly highlighted by the richness of the multiculturalism which characterizes the coastal areas. The city is a succession of events in space and time, but, by the sea, something extraordinary happens. Events are deeply influenced by the maritime identity. Seaside cities' identity derives from the historic relationship between the urban community and the water element. Seaside cities' common memory tells stories of ships, sailors, sailings, routes, maritime trades, cultural blending [1]. The in-depth analysis of the urban spaces along the coastal areas points out the multiplicity of the main elements merging and interacting in these places: the water, the sea and coastal habitats, the shore line, the architectures. In this perspective, architectures and urban spaces in coastal cities appear as an expression of the collective memory of one great sea community. At the same time, they seem to be the materialisation of specific local identities and different urban cultures. Indeed, the common maritime culture is a common heritage, the historical, cultural and economic substrate which connects the sea communities and is reflected in the city, in forms and functions. It is the unifying factor in space and time, in different lands all over the world. Once shifted to the contemporary world, past observations and reflections on water cities could be quite helpful. This kind of recollection offers the needed background to realise high quality architectures and urban places, whose identifying characteristics must be sought in the relationship with the sea. The sea represents a fundamental factor, which gives the city a powerful and strong identity. Nevertheless, in the past two centuries, industrial and military facilities occupied significant areas of the city, triggering processes of unbalanced growth and turning often into barriers. Since the 50's, the evolution of ships, navigation, trade and ports has allowed to empty large port areas, leading to requalification processes and changes which strongly affected the urban coastal zones. Waterfront requalification is one of the emerging issues of seaside cities' urban policies. Cities persistently launch into requalification projects and get closer to the sea and its surrounding areas. These areas go back to the city and get in touch with its community. Particularly interesting appear interventions affecting not only the shore line, but also the "hinge areas": dismissed areas, outskirts, which might have a leading role in development and urban requalification strategies. This kind of approach can be clearly exemplified by New York city, which, in the last years, has been recovering its historical relationship with the sea. In considering the critical current scenario, we can affirm that looking at the sea as a development vehicle for cities can become the basis for a debate still full of implications. Urban identity is a fundamental aspect of building strategies, which pursue the sustainable development of the city. In cities by the sea, the maritime culture and the urban one merge into an identity synthesis. This perspective at the base of our study approach is a fertile field of investigation to reflect on the city, the architecture and the urban places by the sea. It gives rise to new opportunities for development in terms of urban planning and architectural design. In order to make the city development possible, it takes to look back at the sea and start from it through the filter of maritime culture.

2. "Large spaces" and the challenge of local development: philosophic implications of an old-time debate

«There is nothing more epic than the sea»
(Walter Benjamin, Angelus Novus)

The sea surrounds our habitat, embracing it on each side. Especially for those who live in great coastal cities, its presence has turned out to be so redundant as to go almost unnoticed. Thus, the coast quite often happens to become only a holiday or Sunday leisure time destination or, at best, a sort of city's post card. Sometimes, this kind of misunderstanding may also arise in the urban-architectural debate, when considering the relationship between the sea and urban fabric a matter only related to waterfronts. Indeed, the sea is a development element, affecting hinterland and people's imaginary as well. The aim of this work is to make an in-depth analysis over the relation between the city and sea. Particular attention will be drawn to questions, as to how the sea has represented (and, with the right proportions, still represents) a resource, and not only the extreme limit to the ambitions of "civilization". The origin of the word (lat. "cīvis", citizen) attests how civilization is the outcome of the urban dimension. But then, it's not a coincidence that the French synonym "urbanité" is quite often used to qualify a well-defined subject's life-style. A self-aware person, who is totally committed to logic and dialogue, who partakes in political changes of his time and, above all,

feels confident in innate practical potentialities in science and technique's progresses. In other words: the typical European citizen. Nevertheless, if it was the city to give form and spirit to this human type, on the other hand you could also argue that, without the tantalizing perspective of new horizons, it would stifle it. Wild, unbuilt and non-anthropized spaces (mountains, forests, deserts, seas, oceans) have become, then, the extreme reserve of a resistance which has taken its form exactly in the city [2]. If forests have welcomed rebels, exiled and persecuted by the establishment, and mountains, instead, partisans struggling for freedom, the sea has become proscenium of explorers, adventurers and pirates out for new frontiers. The sea is not, however, an univocal dimension. Indeed, there are many oceans, as well as exist many different Mediterranean seas [3]. If the ancient world (especially the Greek one) was allured by the charm of one of the many mediterraneans, the modern one (the Anglo-Saxon, in particular), on the other hand, stoutly turned to ocean. This huge horizon provided a large amount of incitements to modernity in its great revolutions. Without taking into account how, through Cook and Forster's explorations, the ideas of Southern Seas peoples influenced the outcome of the French Revolution [4] just think of the almost uninterrupted flow of valuables (gold, silver, gem stones and new materials, such as natural rubber, oil and uranium) conveyed from the New World to the Old Europe. However, if you consider the capitalist curves of development, you will notice how they (partly) parallel the logistic ones of urbanization rate [5]. Consequently, it's quite clear that, related though they may be, the two phenomena are not perfectly synchronic. This slight difference is the result of an urbanization process, which, rather than abiding by well-defined plans, has seized opportunities and junctures of the time. More precisely, it mainly had an offsetting function to economy. Once each cyclical phase of the economic stagnation has been culminated, according to Keynesian economics, the urbanization process tended to grasp the surplus excess spawned from market saturation. That is what we expect, at least until other outlets have not entered the horizon of our system, channeling the surplus of labor and product to different channels. Thus, the opening of new ocean routes has certainly been a safety valve for system contradictions. At the same time, it has yet attracted new resources, giving rise to less and less well-planned urbanization processes. Far from showing the system welfare, this trend, rather, highlights its *impasse*. If cities are reshaped only according to economic needs, how new projects could deal with the needs arising from the very bottom of society? And, above all, could "a free public space" for the citizens of the modern city exist? This is the disheartening question afflicting those who wonder if the modern economic system is just a coercing mechanism. Among those who bitterly criticized this kind of system, the French economist Serge Latouche is the one who most stoutly expressed his own disagreement. Starting off with an in-depth examination of Western imaginary, Latouche pointed out how the several tensions featuring our system are, ultimately, addressed to growth. Since this sort of development is supposed to be unlimited, the perspective to achieve it, actually, turned out to be quite an obsession. In addition, there is a second paradox arising: the habitat supposed to embrace these limitless growth aspirations, i.e. the world, is a close system itself. You may thus argue: how could it contain the "Unlimited" without collapsing? So, Latouche gathers that, if valid, this contradiction makes the perspective of a system downfall effectively real, forcing us to scale back our expectations of development. This is the degrowth strategy. Essentially, the Latouche-option contemplates a conscious reduction in consumption, followed by a progressive sector contraction. Appropriate security measures, taken in order to hold back the turmoil of capitalism, which resolved to crash into the limits of the planet [6]. As for the aspects of urban planning, the degrowth strategy would debase the importance of arterial roads, which still have a leading role in great distribution strategies. The function of mechanized transport system would thus be scaled down, while, consequently, urban village would be exalted: a more comfortable environment to live in and rediscover the pleasure of cycling, celebrated by Ivan Illich. Nevertheless, many risks would act as a counterpart. First of all: the isolation and the disconnection of the city from the international trade and its progressive mooring to neo-rural life forms. That would put the city before Asiatic capital invasion, triggering processes of reverse colonisation. On one hand, this kind of processes would state the end of western primacy, but, on the other hand, it would not guarantee to get out of the perverse dynamics of the capitalist economy. However, if Latouche's degrowth turns out to be fallacious and not bereft of contradictions, what should we do then? Was Heidegger right in saying "Only a God may save us?" Actually, the situation appears less tough than it may seem. The growth (with all its contradictions) still allows us to have a certain freedom of action. If anything, retrieving it would be very important. But there's a question arising: How to do that? In order to answer this very demanding question, we must do some serious genealogical reflections on the origin and the evolution of our system. It is quite worth noting that Latouche's theories evoke considerations already made by Plato. Already between the 5th and the 4th century BC, the philosopher of the Academy expressed an exception on the overall plan of Athenian development, which, like the European one between the 16th and the 19th century, arose under the banner of vessel traffic. Curiously, in Plato's reflection, moral and political issues were linked to considerations of urban order. That happened not only because Athens was a city-state, unlike the modern nation-state, but because Socrates' pupil well understood how urban structures may definitely

influence city's internal balance. That is the reason why in his work, Gorgias, pretending that it was Socrates speaking, Plato harshly railed against the «illustrious statesmen» of his time, guilty of having filled the city with «ports» and «walls», without leaving any room for justice and temperance (519 b). Plato's invective was addressed to Themistocles and Pericles. Before them, the Attic capital was nothing more than an inland town of scanty trades. Afterwards, Athens would have become a sea power, whose imperial ambition was to conquer the whole Mediterranean basin: the same ambition that would have led up to a fatal breakdown. The two strategists mainly aimed at strengthening ports, walls and piers. Themistocles firstly provided the city with a powerful fleet, in order to make the exchange between city and the sea easier and safer. Furthermore, he linked Athens to the Piraeus Port (originally, a freestanding administrative department located 12 km from Athens city centre) by means of enormous city walls (the so-called "long walls"). Pericles availed himself of those tools to usher in a brilliant trade and military policy. In order to obtain political legitimacy, he relied on masses, which didn't benefit from land rents and favourably looked at the booming of commercial and shipbuilding sector (whose focus is the sea). To captivate humble people's approval, Pericles promoted a «shameless building policy» [7]. By commissioning great public works, the Athenian strategist obtained, indeed, the possibility to guarantee the expected salaries, gaining political legitimacy in return. Completely absorbed by the net of public works, the city sprawled more and more chaotically. The progressive overcrowding of urban spaces did not combine with any adaptations to hygiene system. This kind of carelessness led to a fatal and memorable outcome: the plague of the 430 BC. This overwhelming event deeply shocked Plato. He considered this sort of sea-seeking phenomenon a quite dangerous neglect of ancient values, which used to underline the importance of tiny and apparently mediocre things. Aristotle completely shared Plato's point of view. He firmly believed that the city should have been limited, since a too vast and crowded «πόλις» barely could have been the expression of a good «Constitution» (*Polit.*, VIII, 1326 b).

For this reason, wondering about the conditions required for the foundation of the ideal city, Plato firstly suggested to erect it not less than 15 km from the coast, that is to say, more than twice the distance which separated Athens from the Piraeus port (*Leg.*, 705, c 1-7). Fifteen kilometers would have been enough to stop the rise of all the guilds profiting from the sea and by it influenced. In so doing, each ambition would have been limited to the unassailable rhythms of substance agriculture economy. In making this kind of proposal, however, Plato did not consider man's natural instinct for evolution. An irrepressible instinct which, according to Lewis Mumford, perfectly aligns with the search for freedom of movement [8]. But what guaranteed, at least until the mid-nineteenth century, this kind of freedom? The answer is: navigation techniques. Like other means of transport, the ship represent a technical device. But, unlike the others, it has got ample scope of movement in a space which is generally precluded, since man is a terrestrial being, or rather, is a being, who walks the earth [9]. The sea would remain a barrier to humans if technique did not intervene to make its surface accessible. If this barrier collapses, new worlds will open up beyond their horizons. New worlds, new continents, new existence dimensions, not simply new cities. Beyond the sea limits, something completely different is hidden — a promise. Navigation is exposed to eternal shipwreck risks, as well as each promise implies risk margins. Athenian experience, thus, becomes for us a kind of paradigm, even more if you consider that, just like Athens' development in the 5th century BC, the European one seems to have taken its original resources from vessel traffics. This is what Hegel pointed out, on the very year of continental search for progress (1821, in the midst of early industrialization), by stating that the sea is the only element able to incite Industry and souls into moving outwards [10]. But then, how can you imagine scientific and technological progress of western countries without taking into account their expensive explorations along the oceanic routs, or their trade network with the New World? Copernicus had already pointed out how astronomical observations, made during the first ocean crossings of the modern age, helped disprove the Aristotelian theory on the connections between the Elements Spheres. Afterwards, for want of Bacon, on the title page of "Instauratio Magna" was published the depiction of a vessel about to go beyond the Pillars of Hercules. Below the image, a motto by Daniele stands out: «Multi petransibunt et augebitur scientia» (Many will come in succession and science will progress) [11]. In 1942, the German jurist Carl Schmitt highlighted the importance of naval explorations for the purpose of the so-called "Raumrevolution", which namely is a radical transfiguration of the conception of space, which is seen as the backdrop to any other political, economic and social upheaval. «Whenever new lands and seas enter the horizon of collective consciousness, the spaces of the historical existence change too. There are, thus, new parameters and new dimensions of historical-political activity arising. There are new sciences and sets of rules taking form, there is a new life blossoming for peoples who may be new or may seem born again. This expansion is so surprising as to cause a change which affects not only measures, parameters and men's external horizon, but also the framework and the concept of space itself» [12]. How could all that not affect local and civic aspects of citizen's life organization? Let's take Great Britain by way of example. In the 16th century, Britain was the first European country to be interested in the sea. In English cities, far more than in the mainland ones, the liveliness of economic trade triggered

unstoppable motions of urban regeneration. Indeed, the need to earn an agricultural surplus so as to supply new colonies, totally revolutionized the surrounding countryside. Little and middle-sized landholdings were merged into huge estates, where, for the first time, production was rationalized according to scientific methods (Phenomenon of the “enclosures”). Small farmers, bereft of soil, moved in crowds to cities, where the new labour, in turn, was designed for industry. Consequently: the urban area sprawled; new and crawling working-class neighborhoods rose up around modern factories; streets crowded with lots of people; old paths were leveled to clear the way for the stream of mechanised traffic; times and spaces of existence changed. In other words: the modern metropolis was taking form.

3. Models for a sustainable urban development and the best practice of New York City

*«You may degenerate into the inferior beings, the brutes; You may regenerate yourself, according to your decision, into the superior ones, the divine»
(Pico della Mirandola, Oratio de hominis dignitate)*

The urban sprawl may thus become an increasingly unsustainable phenomenon. Its impact, in terms of ecology and human concentration, greatly affects the overall environmental balance and that is particularly evident along the shore line, which appears the most anthropized area. The hypotheses on sustainable development call for a development aimed at achieving goals of environmental, economic and social improvement. The aim is to satisfy the needs of the present generations, without compromising those of the future ones (Brundtland Report) [13]. On the other hand, one of the emerging issues in the debate over the theme of the city is linked to the degrowth one. That draws the attention on the need to understand the reasons of city crisis and possible pathways to get out of it, maybe by considering the crisis itself a chance to build a different future. New paradigm shifts are needed, compared to the pattern of growth and unlimited accumulation of goods. A controlled, selective and voluntary reduction of economic and consumption production has to be reached with the aim of establishing eco-friendly relationships between man and nature, as well as equity among human beings. But, what is meant by “degrowth of a city”? Is it really desirable or possible? Are the two processes really so far apart or are they the expression of a common feeling, which openly struggles for change, according to socially, economically, environmentally correct requests? Perhaps, one possible way is making cities develop according to a sustainable development, by recovering their own identity and turning it into a resource. Cities first have to understand what they want to be like, or rather, define long-term scenarios and features of their own transformations. All that can be done by triggering the transformation processes needed, identifying specific urban scopes, building new infrastructures and attraction places. Designed though they are for development, these processes often occur chaotically. Our aim is to find the balance between the need for city epochal changes and the necessity of sustainability arising from the bowels of society. There is no city like Zora: «Forced to stand still and equal to itself to be better remembered, Zora languished, unravelled and vanished. The Earth has forgotten it» [14]. In this sense, seaside towns have always played, historically, a leading role in the progress of civilization, as from the sea and in the sea itself, they have found an undeniable vector of economic, social and cultural growth, which has been followed by continuous physical transformations. Even today, cities which develop along the coastal regions and rediscover their waterfront may represent a privileged laboratory to wonder about the fate of the modern metropolis. Such a reflection is possible by identifying innovative development models, revaluating the sea and considering it a horizon full of opportunities, the epicentre of an innovative renewal movement, which, starting from the shore line, covers the whole city. Waterfront transformations affecting great coastal cities imply accurate reflections on the anthropization of these places and the importance of sea trades. Often, though, the presence of disused industrial lands and the interests of private and public operators interested in developing ports and reusing the surrounding areas make projects contrast with the city. In water cities most of investments and interests converge. This kind of investment represents an economic reality deeply affecting the territories they focus on. Nevertheless, when it comes to considering the transformations these investments require, quite often, in response to urban sprawl needs, projects turn from great opportunities into critical contrasts with the urban fabric. Quite often, indeed, local realities fail to adequately assess the capacity of absorption and management of interventions, and do not consider cities' peculiarities and historical [15]. Thus, whatever their direction may appear, be it port growth or the so-called “great events”, projects have not to be stuck in the routine of predefined processes, but walk new paths in agreement with the city. The aim should not be to realise abstract cities, whose stunning architecture is the only thing remaining, but a city planned according to society's nature and material and immaterial needs. Strategies need to be identified in order to give ports and waterfronts a new frame and offer chances of long-lasting development and requalification to the whole city. Consequently, we should not build only along the shoreline, but

consider territories behind it too. Areas between port and city represent “hinge territories”: quite often barriers, dismissed areas, outskirts. They may play a leading role in development and requalification strategies concerning the whole city. Interventions, supported by appropriate urban development policies, may have economic, social and cultural repercussions, not only physically transforming border line areas, but also giving the chance to realise concrete enhancement programmes. These changes affect the surrounding territories and are able to trigger important requalification processes. The urban renewal occurring along the shore line is likely to create new public spaces, both looking at horizons and far away ports and becoming a sort of *plateau*, which fosters new relationships and connection functions with the urban context. Aimed at recovering a relationship with the sea, many seaside cities launched into processes of urban-port reconversion and waterfront transformation projects, through different approaches, policies, plans, characters and resources. The most interesting results come from those cities where the question “what to become?” is followed by an integrated logic, rather than a sector one. By recovering their “maritime background”, cities plunged into many transformations, considerably changing the territory. Cities may, thus, devolve their identity upon the sea, through the comparison between urban and maritime culture, innovation and tradition and through a new conception of the city itself, which puts degrowth into question. In other words, the city turns into a place where a new urban development model is tested: a model for a neither unlimited nor regressing growth. New York is a historical seaside city (four of the five New York districts are islands, while the fifth is a peninsula), which has always linked the Ocean to the inland waters in commercial trades. For years, New York has been reconsidering the city-water relationship through the requalification of the ports, the waterfront and the areas behind it [16]. The water is considered the “Sixth Borough”. Waterfront requalification processes in New York city are continuously evolving. In 2011, in continuity with the 1992 City Planning, the “Waterfront Vision and Enhancement Strategy” was approved: a plan of action designed to achieve the sustainable redevelopment of 520 miles of the New York waterfront. The plan is divided into two parts. In the first, “New York Waterfront Comprehensive Plan”, are listed all the long-term objectives for the decade to come, with some recommendations about each of the waterfront sections belonging in the five districts. In the second, “New York Agenda Waterfront City Action” we are shown 130 overriding projects to be realised in the next 3 years: the projects contemplate integrated interventions, which concern the waterfront and its surrounding areas and focus on the requalification of public space [17].

«The eight main objectives of the plan:

- Expand public access to the waterfront and waterways on public and private property for all New Yorkers and visitors alike.
- Enliven the waterfront with a range of attractive uses integrated with adjacent upland communities.
- Support economic development activity on the working waterfront.
- Improve water quality through measures that benefit natural habitats, support public recreation, and enhance waterfront and upland communities.
- Restore degraded natural waterfront areas and protect wetlands and shorefront habitats.
- Enhance the public experience of the waterways that surround New York—our Blue Network.
- Improve governmental regulation, coordination and oversight of the waterfront and waterways.
- Identify and pursue strategies to increase the city’s resilience to climate change and sea level rise» [18].

New York is, so, reshaping its urban frame, by starting from its memorable relationship with the sea and by projecting the sea towards the city. Precisely, new projects concerning the border line areas and the huge surrounding territories are launched, so as to lead up to transformations which strongly affect the city balance.

4. Conclusions

The question arising at the end of this paper is: if the sea triggered this set of processes, may it still serve as an attraction for the development of our cities in crisis? The answer is not so obvious. Without giving rise to misunderstandings, we must admit that, nowadays, the sea no longer appears the promising uncertainty it used to be in the past. Explored along its entire surface, it seems not to be giving anymore any kind of secret, hope, resource or opportunity. Nevertheless a reflection, metaphorically at least, on the spirit which animated the first great explorers of our time, could turn out to be an exercise full of implications. This kind of reflection aims at identifying other spaces (maybe in the sky) and other ships (maybe space ships) able to realise the disillusioned utopias of a civilization, which seems to be literally plodding in the adversities of the industrial era. Stopping or slowing down the growth is not our real challenge. Actually, we aim at pursuing it in a sustainable perspective, able to combine development reasons (the same as science) with the typical aspects of philosophy: order, justice and proportion. As in the past, seaside cities planning and development could once again bring to political legitimacy, if the administrators were oriented to a direction quite consistent with sustainability principles. In other words, governments which are less and less sovereign, should go

back to hold the reins of the city, limiting the authority of the great economic powers. That should be done in order to share spaces and economies, which find, in maritime culture, the basis for transformation processes. A shared planning is required, in order to offer opportunities for great public works and new economies for the generations to come. The sustainable or unsustainable evolution of the city will depend on the course that new spaces, interest distribution and rules defining are going to abide by. What we are focusing on is a transformation process, characterized by a productive “unlimited growth”. A growth whose transformations and benefits affect the whole territory and citizenry. The objective is to reach a fair growth, shared and integrated, which could consider the sea its starting point and determine a new urban frame positively affecting the internal balance of the city. The actions needed do not have to focus only on their concrete and immediate aims. Rather, they should help develop the awareness to belong in the city. In order to properly spread this kind of awareness, city transformations firstly have to align with clear and shared rules. Secondly, administrators have to hold in check soil use or reuse, in order to take advantage of the rising property values. The rise of property values, which is the outcome of common decisions and investments, plays a leading role in city planning, leading to the realization and the operation of infrastructures designed for public use.

Abstract

Among the many issues that concern the regeneration and shape of public spaces within the waterfront areas, the way in which these spaces respond to the multifaceted influences resulting from globalization, multiculturalism as well as maritime traditions has been chosen for this study. The key issue is the material and immaterial way port cities traditionally combines influences from elsewhere with local identity, in order to define urban design tools oriented to deal with the social and cultural fractures of contemporary urban areas.

The main purpose of this research is to develop a methodological approach that targets enhancement of multiple roles of waterfronts in order to favour social inclusion and cultural interactions. The interpretation of multifaceted social needs is aimed at defining strategies in order to improve processes for producing inclusive public spaces. To explore this scenario, case studies have been focused on waterfront regeneration projects in Belfast, Marseille and New York, in order to develop applications for other multicultural heritage.

These case studies have been oriented at identifying the characters of those public places that lie on the borderline between land and water, peoples and cultures, port and city. These contexts have been chosen in order to address policies of waterfront regeneration consistent with the role of public spaces in interpreting the intensity of cultural diversity in terms of integrations and interactions.

Keywords: cultural identity, port city, Belfast, Marseille, New York

1. Introduction

The genesis of the city on the water is strictly connected with the idea of crossroad, melting pot as well as bridge amid diversities [1]. The ideas of dynamicity, globalization, and multiculturalism rest on the nature of the cities that were born as crossroads of flows of peoples, cultures and goods [2]. These historical water-cities have been able to enhance the added values of being multifaceted and resilient as well as to develop the antibodies to protect the organism against the negative effects of their specificity [3]. Understanding the nature of these antibodies, developing and subsequently inoculating it in other urban context could be an important contribution to dealing with the major issues of the contemporary cities.

This research aims at developing a complex approach in order to understand the capacity of public spaces in waterfront areas to assimilate and metabolize the multicultural dynamics building a new inclusive local identity. The specific topic is to define a methodological approach oriented to identifying morphological and functional characters of public space in order to implementing inclusive tools for urban design [4].

This paper seeks to unveil the nexus between urban regeneration processes and multicultural issues, by investigating the added value of “glocal” identity of cities by the water [5]. At this purpose, it first discusses what values have dominated in the waterfront regeneration theory and practice throughout the last decades, advocating the recasting of local development issues within a more identitarian oriented conceptual frame. Secondly, it explores the role played by maritime tradition in governing urban transformation oriented to enhance the multicultural and resilient features of public places. The

research methodology has been developed through three purposely selected case studies: Belfast (a river city characterized by a troubled past of sectarian conflicts), Marseille (the symbol of the Mediterranean culture and of the maritime osmosis) and New York (the global-city on the bay) – by applying a qualitative research methodology.

A case-study approach has been chosen [6] in order to better address the idea of plurality underlying the cities by the water, focusing on relationships between urban elements and cultural aspects, social equity and conflicts, environmental vulnerability and resilience [7]. To explore this scenario, case studies have been focused on waterfront regeneration projects in Belfast, Marseille and New York, in order to develop applications for other multicultural heritage [8]. These case studies have been oriented at identifying the characters of those public places that lie on the borderline between land and water, peoples and cultures, port and city [9]. These contexts have been chosen in order to address policies of waterfront regeneration consistent with the role of public spaces in interpreting the intensity of cultural diversity in terms of integrations and interactions [8].

Findings and conclusions can support the larger planners and policy makers international community in better appreciating the role of the osmosis between “maritimity” and “glocal” identity in urban regeneration initiatives. The next step should be focused on the development of an interdisciplinary approach oriented to define priorities for intervening on the contemporary city enhancing cultural interactions, social equity, local development as well as environmental sustainability.

2. Cities by the water and multicultural ethos: toward a complex approach to urban regeneration processes

The cities of water, despite the multiplicity of aspects and vocations, historical conditions and stress factors, morphological configurations and social characteristics, retain some common characteristics on the one hand and outline a strong and dynamic identity on the other [10]. The ability of changing – adapting itself to the transformations of an increasingly global society – of implementing technological innovation – accepting the evolution of port technologies and transport modes – of including the diverse cultures that come from far away – mixing them to create a new identity – are all peculiarity of this typology of urban centers. This *flexibility* in accepting, implementing and reinterpreting the consequences of the migration dynamics as well as valorising the mutual exchange between cultures can be considered the first of the highlighted keywords [11].

This feature present in all the studied contexts is one of the strengths of the process of building public spaces in urban waterfronts and is combined with the second keyword inferred: the concept of *cultural richness* that the city by the sea interprets in a plural sense [12]. This inclusive cultural dimension helps to define precisely the concept of identity that can not (and should not) appear stuck in a time and a place but need to be the fluid expression of a dynamic and vibrant city. The third element of the checklist is the role of *catalyst* expressed by the borderline between city and sea in the processes of urban regeneration [13].

We should not forget the relevant aspect of the *social role* played by the strong identity of the waterfront that encourages cultural interaction and social cohesion by providing a context of dialogue in which we can recognize the different societal components [14]. Through the interpretation of the case studies using the four key concepts highlighted, a checklist to support a process of urban regeneration in maritime key could be developed, in order to grasp the vital energy of frontier between land and water [15].

The development of the case studies allows testing the key concepts mentioned that, bringing together the different contexts (both in positive and negative way), should be considered the guide for the definition of a resilient and identitarian approach to urban regeneration processes [16]. Each case study presents the coexistence of topics exemplified by the four key concepts, but some of them seems to be the paradigmatic expression of a specific topic-keyword.

The key concepts highlight the cultural dimension - interpreted in a plural sense by city by the sea - the social dimension - that encourages the shifts of social conflicts - and the economic dimension - expressed as a key to the feasibility of the transformation processes [17].

The first key concept is the *cultural richness* of the city-port, which are at once crossroads, bridges and portals. In some organizations surveyed, multiculturalism has become the banner of policies and design strategies. Marseille is the epitome of this approach, both for the role historically played and for the recent redevelopment projects that have been oriented to make it the main euro-Mediterranean city and the bridge between the two continents. The case study of Marseille is emblematic because the maritime tradition, multiculturalism and architectural innovation have permeated massively the redevelopment project in progress, aimed at came across the Mediterranean cultures.

Overseas, New York, the city symbol of American cultural melting pot, can be seen as a metropolitan area whose center of gravity is an aquatic bay intensely lived and interconnected by maritime routes. The success factors of this model can be summarized as follows: a capillary structure projected into

the historic port with picturesque piers – a testimony of a cosmopolitanism that "comes from the waters" – and the dialectic between the architectural verticality of Manhattan and their profile which is reflected in the water. The continuous action of redevelopment of the waterfront and of the abandoned historical port areas as well as the enhancement of public transport on water supplemented by other transport modes provide the enhancement of the centrality of this multicultural city.

The social role of the waterfront is developed in the complex context of Belfast, a conflicting society in which a space of neutral encounter and interaction can be found on the river waterfront. The Belfast scenario is extremely complex and atypical in the European scene. In spite of the tradition of the port-city open and inclusive, the main city in Northern Ireland has been the scene of a bloody conflict that produced political and religious isolation from the outside and internal divisions. The river that runs through it can be qualified as an element of social and physical reconnection of a fragmented and divided city. In this scenario, the river route generates a waterfront punctuated by catalyst elements integrated in a systemic approach. These elements of the urban form consist of important projects of urban regeneration that have been started in order to support the peace process through the development of productive activities and the refurbishment of abandoned areas and brownfield.

As we will demonstrate, within these three emblematic case studies the pivotal elements of an identitarian and resilient regeneration process will emerge.

3. Case studies: three cities for an identitarian regeneration process

The common thread running through all the examples collected here is the added value and impact of the waterways on the cities that were born on the edge between water and land [18].

Mediterranean cities have drawn from the Mare Nostrum their location, cultural diversity, economic development and incomparable architectural solutions for the defence, the port organization and the main places of worship. The Oceanic cities tell a story of great distances and adventures. The cities overseas appear vassal of the Old Continent first and then the bearers of new identities. The river cities form merchant poles, lying between the bends of their tutelary deity: the river. In each of these contexts it is possible to extrapolate strong design elements that are stratified over time, contributing at defining the character of urban identity, in the direct or indirect relationship with the water [19].

Focusing on Belfast we can recognize that each redevelopment project studied can be considered a block of a complex urban taxonomy oriented to reconnect a fragmented urban tissues [20]. Along the last decade, after the starting of the Peace process, the city centre has been transformed involving abandoned manufacturing areas and brownfields from the rich industrial past. This process is part of a programme for re-branding the image of the city after the bloody "troubles". The insularity of this first phase of projects could be solved enhancing the role of connector played by the waterfront. The river Lagan can be considered the common thread running through the city centre reconnecting the project of regeneration and redevelopment such as Titanic quarter, the Gasworks, the Lanyon Place, favouring the encounter and interaction between a divided society.

The role of Marseille in our case study approach is focused on the effect of the huge investment of the central government oriented to the redevelopment of the waterfront area through architectures by the star system of the architectural firms and some traditional reproductions of local architectures. The Euro-Mediterranean model adopted could be defined – provocatively – a sort of merchandising of the traditional brand of the old port and its history and story telling. The strong genius loci of the Vieux Port is the counterpoint to the new tower by Zaha Hadid and to the other concept buildings that have been designed by the most famous international architects.

Concerning New York, the "big apple" is part of the Western collective memory and the node of the maritime relationships between Europe and the USA. Despite this exceptional character, New York City can be considered a paradigmatic example of urban development based on the strategic dynamics of the bay area and of their uses (i.e. transport, leisure, heritage, property, blueprint).

The case studies have been examined as follows.

3.1 Marseille: hub of the Mediterranean cultures

The case study of Marseille is emblematic both for the relevance of maritime dimension in the historical urban development and for its role as urban and architectural laboratory – confirmed in the Forties by Le Corbusier with the Unité d'Habitation, realized in the South of the city and considered the manifesto of Rationalist architecture. This tradition between maritime activities and architectural innovation is reflected in the dynamism of ongoing changes oriented, on one hand, to enhance the waterfront as pivot of development of euro-Mediterranean relationship and, on the other hand, to revitalize internal areas defaced by industrial abandonment and by social housing estates [21].

The city of Marseille is the first French port for size, it is the second city for number of inhabitant, being capital of the Provence-Alps-Cote d'Azur region; the city is administratively divided in 16 *arrondissements* that include 111 neighborhoods. Since 2000, Marseille and its 18 neighbouring

municipalities were administratively recognized as urban community: the *Communauté urbaine Marseille Provence Métropole* and the “*Grande Marseille*” [22].

In the coastal area the human settlement has an ancient history and nowadays it is extended on 57 kilometres surrounded by the hills of the Calanchi Massif. The city is developed around the core of the ancient port coincident with the foundation area (600 BC) near the Lacydon.

The urban origins and development are strongly connected with the maritime tradition: the *forma Urbis* is the mirror of this mutual relations and the main symbolic urban spaces are directly or indirectly related to the maritime activities. The historical commercial vocation of the port area characterized the urban growth, enriching the city with religious and civil buildings during the centuries and defining the current urban layout, resulting by the relocation of the port to the Joliette (up to 1842) and by the production of Haussmannian arteries and monumental architectures [23].

More recently, maritime tradition, multiculturalism and architectural innovation are the focal points of an urban redevelopment process aimed at making Marseille the bridge-city among Mediterranean cultures. In a geopolitical phase expected to reshape the balance between North and South, the Mediterranean Sea is recovering its centrality in the European policies: the French Government bets on Marseille – also Capital of Culture in 2013 – to turn it in a hub of the Mediterranean culture, combining cultural overseas ties with economic issues. Nowadays the planning activity hangs in the balance between the re-interpretation of original role of Marseille as port-door in the Mediterranean area and the global version of the seaside city [24].

The urban regeneration programme is aimed at social, economic and cultural goals, as well as environmental renewal, through the transformation of 480 acres of industrial areas and buildings, from the nineteenth docks of Joliette, north of Vieux Port, up to the Belle de Mai. The keyword is the Mediterranean culture, expressed through the development of local maritime transports, the waterfront project enriched with international functions and everyday-life spaces, new buildings inspired to the new maritime city dimension, by enhancing memory places where the community has been in contact with people arrived from overseas lands [25].

Joliette is the first building block in the coastal area, in a strategic location between port and urban center, with a high level of accessibility thanks to the near airport, the train station TGV, flyovers and train and metropolitan lines. From 1992 to 2002 the buildings of the Docks have been recovered and in 1998 *la Place de la Joliette* has been inaugurate with around the business district and the downtown worker housing.

Near the *Gare Saint Charles* intermodal hub, the *Belle de Mai* in an example of industrial sheds reused for digital and multimedia industry and culture, including museum and archive cluster, media center that is the core of *Incubateur national multimedia Belle de Mai*, big thematic village which contains private and public relevant media production.

The *Euroméditerranée* urban planning project drives a process of transformation and urban adaptation based on reuse of existing heritage and new architectures: new residential districts and offices built or under construction, located in the industrial and abandoned port areas, in the future supported by the tram line. The five main poles are the following: the *Pole Belle de Mai*, creativity and socializing place which includes spaces for shows, expositions, art events, housing, municipal archives, multimedia pole, National Institute of Audiovisual archive and also the CICRP (*Centre Interrégional de Conservation et de Restauration du Patrimoine*); the *Pole Saint-Charles - Porte d'Aix*, which accommodates institutional, academic and commercial activities also transport industry; the *Pole d'Arenc* is the core of economic development real estate; the *Pole de la Joliette* in which are localized economic activities and housing; the Pole Saint-Jean which contains the MuCEM (*Musée des civilisations de l'Europe et de la Méditerranée*).

The *Rue de la République* redevelopment project is aimed at enhancing urban life quality and physical renovation of a central residential and commercial road. The project includes: the haussmannian facades renovation, the adaptation of 5200 housing units as OPAH (Housing Improvement Program), new parking areas, facilities, retails, sidewalks, 200 planted trees and the opening of *Blanarde-Euroméditerranée* Gloves tram line.

The *Cité de la Méditerranée* represents the waterfront revitalizing project, three-miles long, located between Arenc and Fort Saint Jean in the Vieux Port, aimed at bringing together these two symbol places of the city, reconnecting the city to the sea and reconfiguring the interface area with the port. A new terminal ferry near the Major and cultural, recreational and service facilities define the new skyline, contributing to build a pole for economic and cultural exchanges between Europe and Mediterranean cities. The project is integrated with the development of the *Mole F4* and the Fort S. Jean's foundation.

Other projects started in 2007 – as the Sainte-Marthe eco-neighborhood and the 15-ha Aygalades Park – have been obtained the EcoCité brand about sustainable development [26].

Fig. 1: Marseille, the view of the Docks (by Dionigia Barbareschi).

The goal of this regeneration process is to make competitive the city of Marseille through the doubling business district, in order to improve prestigious and low impact activities and urban life quality, through housing achievements, public spaces, accessibility and urban transports. The three column of cultural, political and planning project are: arts to valorize the Mediterranean identity, euro Mediterranean international relationships and local traditions.

Euromediterranée is a big project, considering the physical extensions and the financial resources invested, aimed at “returning” the sea to Marseilles. This ideological manifesto is an attempt to enhance a city in deep crisis for a geopolitical relocation in the Mediterranean area. Huge investments, creativity and technology have created futuristic glass palaces, one fashion city, the docks turned into a long walk hanging, the highway going to disappear underground. In this scenario, in 2007 Zaha Hadid designed the CMA CGM for the offices of the shipping company: the sinuous 148-meters high tower redraws a new urban skyline and it competes against the thirteenth Madonna of Guardia, a gold sculpture traditionally defended all ethnic and religion sailors.

Many other famous designers have filled the urban development such as the project for the new waterfront, the Euromed Center by Massimiliano Fuksas and the Tower by Jean Nouvel, new symbols of Marseille, without to dissolve the fascinating Vieux Port. The last but not the least is the MuCEM, Museum of Civilization in Europe and Mediterranean designed by the Algerian-born French architect Rudy Ricciotti.

As demonstrated by the projects briefly described, the waterfront has been chosen to characterized the urban regeneration of Marseille, enhancing its maritime tradition. The case of Marseille highlights how starting from the evocative power of water, naturally heralding of transformation, it is possible to check the key to renovate and revitalize the city, adapting it to the mutation of new urban community answer. However in this ongoing process of transformation, the approach pursued is more stereotypic than innovative. The model pursued could provocatively define a franchising, a global brand that is juxtapose on fascinating forms of an historic city ordained by changing wave. So the peculiarities of Marseillaise *genius loci* are likely to be lost, on one side, in the plastic forms of extraordinary design experiments – that do not evocate any identity of place – and, on the other side, in action of maquillage on existing buildings and functional reorganization according to standard models.

3.2 Belfast: conflicting city and waterfront regeneration

Belfast is the capital and also the largest city of Northern Ireland (for inhabitants, function and economic system); administratively Belfast is part of United Kingdom with a specific discipline of governance. The character of the settlement has been determined, since its origins, by the peculiarity of water system of this offshoot located on north-east side of the ancient region of Ulster; Belfast overlooks on the Lagan outfall and it is located along the Belfast Lough [27].

The relevance of the Belfast case study is mainly related to the role that the waterfront is playing in the reconnection of urban areas, in the past divided by the effects of the long time of “Troubles”. The conflict determined a sequence of discontinuity on physical and functional urban organization, a fragmentation of land use that is the mirror of a divided society. In spite of activist and institutional action toward peace process, these divisions remain, configuring an auto-segregation de facto [28].

Recent research demonstrate that the 80% of population still lives in segregating street and residential complex [29]. This is not the place to address an extremely complex issue, with many cultural, social, political and economic implications thoroughly investigated from different points of view, from different disciplinary skills and different artistic expressions. An expensive literature can be consulted at the Linen Hall Library in Belfast, entirely dedicated to the historical reconstruction of the tragic events [30]. During the 19th century the port expanded with new manufacturing activities related to the sea and navigation, also if the key industry was represented by shipbuilding. Since 1914 the Harland & Wolff company represented the main source of occupation and it was the biggest shipyard of the Europe and one of the largest in the world [31].

In postwar period, the crisis of European industrial town particularly affected Belfast, adding to the religious conflicts and making the Northern Ireland economy unable to compete with the economic vitality of the nearby Dublin. In these dark decades the city has been petrified by fear and suffering - coinciding also with the divestment of industry peak and economic crisis – leaving relevant marks in the social, economic and urban system [32].

From the urban planning point of view, it is registered a strong tendency toward the suburbanization, mainly related to protestant middle-class, encouraged by the scenario of violence and urban decay and by the planning choices, starting from the Regional Plan for Northern Ireland (1964) [33].

The planning activity, almost restarted during the years of the violence, finds a new rush at the beginning of the peace process at the end of Nineties, especially through:

- requalification of public housing (Northern Ireland Housing Executive);
- infrastructure for mobility, energy and telecommunication;
- regeneration of port (Belfast Harbour Commissioners) and Lagan riverside;
- regeneration of city centre.

In order to accelerate the process of physical and social regeneration cities, the form of public-private partnership has been adopted through the Urban Development Corporations (UDC). This regeneration phase has been assigned to 'Making Belfast Work' program (1988) and Belfast Urban Area Plan (Department of the Environment, 1990) [34].

Several and relevant projects of regeneration and development are oriented to create a new imagine of peace and wellness able to remove the collective memory of tragic events of civil conflict. The two main regeneration projects, started when the armed conflict was still in place, are the *Laganside redevelopment* and the city center regeneration, both directed towards ensuring the achievement of "neutral areas" able to break the wall between community.

The Leganside area includes about 140 acres of riversides, coincident with an abandoned and contaminated industrial site and surrounding by degraded neighborhoods characterized by an high index of social deprivation (deprivation indexes, NINIS). In the 1989 this area has been chosen for a regeneration pilot project in order to demonstrate the "potential of the property market to recover the city from economic decline and political turmoil" [35]. Referring to the model of waterfront regeneration of Baltimore (USA) and London Docks, a mixed public-private society (Urban Development Corporation UDC) has been created, called *The Laganside Corporation*, mainly supported by British government funds.

Fig. 2: Belfast, Pedestrian bridge in the Laganside area (by Gabriella Esposito De Vita)

The public subjects involved are the Belfast City Council, the Northern Ireland Housing Executive (NIHE), the Belfast Harbour Commissioners and relevant government departments. The project has been completed in 2007 and new initiatives have been started along the river, like Lanyon Place, Donegall Quay, Clarendon Dock and the Odyssey Complex.

Another project along the waterfront concerns the *Gasworks* rehabilitation. Starting from 1822 and during 150 years, the energetic provision of Belfast has been guaranteed by the Gasworks. The abandonment of this area left volumes of industrial archeology, reused by an initiatives of the City Council oriented to build an industrial incubator, with accommodation facilities (Radisson Hotel) and advanced industry. The area includes also the project of public spaces, with exposition of artworks and accessibility to pedestrian and cycle path along the Lagan river.

The work in progress *Titanic Quarter* project represents one of the most ambitious initiative of urban regeneration ongoing in UK [36]. This brownfield site covers an area of 75 acres in the Harland & Wolff shipyards, located in the Queen's peninsula on the North-East of city center and linked to Donegall Quay by a bridge. Nowadays, the company which built the Titanic continues to work in a small area of the original site and it gives the name to this complex district (www.titanicquarter.com). The development plan provides many functions: a mix of shopping, training and research activities, various size and using target of housing [36]. The economic plan provides investments for 2.500 new residential units, 50.000 square meters of productive areas, 10.000 square meters of structure for leisure, two hotels, 7.000 square meters of shopping center and a building for a college could be innovative from energetic point of view. Two public-private companies created *ad hoc* manage the rehabilitation plan of the area that is property of Belfast Harbour Commission. The plan is also aimed at producing an indirect positive effect toward working-class neighborhoods of East area, damaged from the abandonment of shipyard. This last aspect seems a challenge because of the typology of provided activities and elitist dimension of distributed services will have high influence on these areas.

The projects described represents an important piece of the urban revitalization process, that assume strong connotation if we consider the peculiarity of the context and its framework of tension. In just over a decade, the city center has worked a "normalization" result unthinkable in the Nineties. The heritage of the industrial past have been renewed, starting a "branding" process more than a territorial marketing, to create a new imagine able to cancel blood traces.

3.3 New York: a water metropolitan city

The case study of New York highlights some key points to re-interpret the relationship between city and sea, not in terms of transports or aesthetic issues but for enhancing urban maritime identity. The city can be seen like a water metropolitan area whose centre is the Upper Bay on South Manhattan [37]. This characterization born with the historic role of New York Harbour as crossroads between ocean and internal water flows and nowadays it is strengthened by a continuous rehabilitation of the waterfront and abandoned historic port areas, developing a collective sea transport integrated with the other vehicles.

New York City is part of the State of New York and it is articulated in five big areas (defined administratively "boroughs") linked by the water that is the core: Bronx, Brooklyn, Manhattan, Queens and Staten Island. It is the most densely populated metropolitan area of USA. The bay is the focal point of a settlement system of metropolitan level that is developed from Long Island to New Jersey, using the water like cohesion factor for a diffuse historic port structure projected in the water with suggestive piers, influencing the life quality and local economy [38] [39].

The port activities dominated after the born of the Union, enhancing the role of crossroads of commodity and people flows, until demographic explosion of the 19th century [40]. The geopolitical events lead the city to be the access of immigration and exchange pole with Europe, determining the actual role of cosmopolitan metropolis.

Through the first American dry-dock on the East River (1824), openness of Erie canal (1825) and the internal and external "waters wedding", New York became the most important port of North American transshipping and finally interchange for the transoceanic commodity. At the end of 19th century it was necessary to discipline the development of port waterfront with the achievement of appropriate organism: the Department of Docks (1870) [41].

Over the Centuries the city have represented the access door from Europe, the starting point for transport to East Coast and internal transshipping and, today, a redeveloped and re-functionalized waterfront, destination of tourists and qualifying factor of urban life [42]. This set of factors has determined a particular attention to the waterfront, not like the boundary between two worlds, but like the window on the "fluid" part of the city, link between the urban monuments, sociality, renewal of historic memory.

Manhattan borough is the main place of the metropolitan system that is stoked up through water ways. The long-sightedness of decision makers and stakeholders has led the city to exceed the crisis like the Big Depression of 1929, the crisis of port and economic activities in Seventies and the terrorist attack.

Fig. 3: New York, the East River and Manhattan (by Gabriella Esposito De Vita)

Saskia Sassen in her most important work (1991) defines New York, with London and Tokyo, a "Global City" [43]. This expression evokes the complexity of the functional relation, the interconnection of economic-financial dynamics, the multicultural stratification, the role of catalyst of material and immaterial resources with a global skyline that identify the most populous United States metropolis. The "Big Apple" shares with London (and Toronto) also the title of capital of cosmopolitanism [44].

In the contemporary city, abandoned areas and infrastructures localized in a quality places, like the riverside, allow actions aimed at valorizing the character of existing city interconnecting the pre-existences and projecting them toward the sea. The waterfront rehabilitation started in Seventies is being completing with the progressive empowerment of maritime dimension from inhabitants, visitors and city users [45].

The New York coastal line is articulated and extended: the waterfront is 1000 km long and includes more than 11 ports: Manhattan, Brooklyn, Queens, the Bronx, Staten Island, Perth Amboy, Elizabeth, Bayonne, Newark, Jersey City, Hoboken, Weehawken, Edgewater. The first wharf on the Manhattan dock dates back to 1648 and it is made by Stuyvesant in the lower East river (Schreyers Hook Dock).

The river landscape enhances the skyline perception from different points of view and the water ways offers a capillary increasing accessibility, highlighting the strategic role of the coastal line for improving urban quality. In this urban system, the waterfront represents the "red line" that links all the present and future interventions, also by some thematic nodes: renewal of land-sea relationship, valorization of abandoned port areas, environmental compatibility and more inclusionary housing [46].

The South Street Seaport is the physical and temporal starting point of the waterfront regeneration: restored in 1983, it includes a museum located in the ancient Fulton Fish Market, a traditional market, restaurant, a panoramic path and a shopping center on the Pier 17.

An important element of interconnection is the Manhattan Waterfront Greenway (MWG), an example of urban transformations able to preserve the ecological dimension of spaces organization, without neglecting the economic sustainability. The MGW is a 32-mile-path around the Manhattan Island, built by transforming a degraded waterfront in a green attraction for leisure and commuting uses. It also permits an alternative access to most congested areas of the city, including interventions on the existing road sections through the Battery, the reconversion of the industrial port of the West Village and Chelsea Hudson River Park and the transformation of the inaccessible Harlem River Speedway in a promenade. In this way, new interventions are connected in the Lower West Side – from

Meatpacking District, TriBeCa, Chinatown and Greenwich, until Battery City Park – with renewal and reconstruction actions of the area of Financial District overwhelmed by 2001 events.

Chinatown and TriBeCa (Triangle Below Canal Street) due their recovery to the Washington Market Urban Renewal Project of Sixties. Today TriBeCa is a busy place of Film Festival, characterized by art galleries and restaurants, integrated with the valorization of Meatpacking District, where is the notable intervention of High Line, paradigm of an approach aimed at combining infrastructural renewal, ecological dimension and development of collective spaces. Today, the elevated road – symbol of an industrial past connected to the transoceanic trade – is a green promenade and an important element for the revitalization of 19th century borough, enhancing collective memory about the maritime history of the city.

The series of interventions along the Hudson River systematizes the area and opens it toward the sea, as well as it happens on the other side, the East River waterfront, by projects involving the boroughs of Manhattan, Brooklyn and Queens. In Manhattan, particularly, the South Street Seaport project is the meeting of history with contemporary innovation. The entire project is characterized by community spaces, promenade along river and shopping and leisure center that can develop the usability level in the area.

On the other side of Brooklyn bridge, the rezoning plan for Greenpoint-Williamsburg area includes the creation of 50-acre-park that is integrated in the waterfront Access Plan. The plan represents a community asset, developing in cooperation with local community, investor and stakeholders. It is connected with the East River Park and the other areas of riverfront recovery in the whole city. In 2009 this integrated system gained the international award “Excellence on the Waterfront” by the “Waterfront Center”.

4. Conclusions

The theme of the city by the sea leads to deal with the concept of the border, the theme of the limit which has always been a challenge for those who are involved in designing urban transformations. According to the approach chosen, in fact, the boundaries could be interpreted as separation and denial but also as a transition to something else [47]. The frontier between the two worlds is nourished by the tensions towards the exploration and fear of the unknown and owes its shape to the way in which the civilizations that face these tensions live.

The fears and tensions between land and sea have created marvellous pages of literature - such as the explorations underwater of the Nautilus and the epic battles between the old man and the sea or to relentlessly hunting of the white whale - that testify the intensity of man's relationship with the aquatic border. This relationship is strengthened in inspiration than in all the artistic movements was taken from the flowing of water within or on the edge of the city. In architecture, the same tensions have led to the creation of cities reaching out into the waters or defensively behind the trenches from which the ships were leaving toward new adventures [10].

As pointed out across the case studies, the evolution of space-functional organization of the coastal cities has always been influenced by the aquatic element for inclusion or denial: it is the element that connects, facilitating exchanges and produces wealth but it is also the enemy to be resisted. The water is a constraint to overcome, giving rise to incredible architectural virtuosity, or to cancel, creating an urban space interconnected but lacking the beauty that could be produced in designing the relationship between architecture and water [48].

The evocative power of Marseille helps to understand that starting from the fluidity of water, by their nature harbingers of change, you can search for the key to renew and revitalize the city, adapting to the changing demand of urban communities as well as it always has been for the navigation. The difficult challenge that is experiencing Belfast in an attempt to recover social harmony through a process of urban renewal is actually based on the waterfront and trails along the river. Even New York has risen several times by focusing on its role as a bridge between worlds and hubs and concentrating the regeneration process around and through the upper bay, called the sixth borough of the city.

The criterion for choosing and the procedures for developing the case studies highlight some central elements in a process of formation of the design choices. In an era in which the globalization of economic phenomena, the fluidity of social change and the dynamism of the concept of cultural identity make it difficult the recognition of places and architectures [49], the examples show a reality in countertendency. The presence of the water is not a source of identity per se, but it contributes to the development of urban and architectural solutions: bridges to reconnect parts of cities, fortresses to protect, waterfront equipped to increase the areas of public spaces and to restore the environmental balance, platforms logistics to adapt dynamically to the demand for services and symbols that unite different cultures. Human ingenuity in taming nature respecting the balance is the basis of longevity of such city-port systems. Interesting prospects for further interdisciplinary research will open up as well,

helping to define priority actions to be put in the field to act on the contemporary city in a key cultural interaction, social equity, economic development and environmental enhancement [50].

Abstract

The uniqueness of the archaeological findings in the area of Croce del Papa in Nola suggested to the Archaeological Heritage Superintendence of Naples and Caserta designing an "Archaeological Park of Prehistory". This paper illustrates a proposed project for the PAN (in Italian: Parco Archeologico di Nola) which involves the construction of a built system finalized to a compatible fruition, in accordance with the needs of conservation and protection of the archaeological heritage, but, at the same time, disseminating the knowledge of historical and social character of this extremely important site. So, the support to fruition structures were designed with an integrated approach both from the point of view of the size that the environmental impact, in line with the idea of "Diffused Museum", that we believed to be the most suitable solution to organize in balance a so rich in value site. The services and activities of the PAN will be carried out within specific temporary structures, made with a few natural materials such as wood, brushed aluminum and glass. These structures have the same generating matrix, suitably varied depending on the different use: museum, laboratories, info-point, ticket office, bookshop and restoration area. These are sustainable structures, designed in accordance with some of the main bioclimatic rules: orientation, natural ventilation, use of natural materials and sources, renewable energy, recycling of rainwater. Through these design measures, the technological solutions increase the eco-friendliness of an "architectural object".

Keywords: Technological Design, Energy Efficiency, Sustainable Use, Ecofriendly Behaviour

1. To experiment preserving¹

"Any technique always refers to a transformation of a subject, object, knowledge and feature. It is evident that techniques differ according to instruments used to achieve these transformations, but even more depending on the choice of transformed object" [2]

The cultural heritage, exposed to continuous risks of decay, is frequently preserved with techniques that must not transform the heritage, but can only transform how man can use it and benefit.

To experiment a compatible way of enjoying cultural heritage, without harming their intrinsic values, requires creativity and audacity, but also awareness and sensitivity. [4]

If we consider technological design as "action research" in order to give an environmentally friendly solution to the problems of conservation and enhancement of the archaeological heritage, it allows making decisions through a creative act that leads to formulating a variety of design solutions. These can be particularly sensitive to the needs (conservation and enhancement) and adapted to the environmental characteristics of the archaeological site.

The need for restoration above all comes from the state of degradation of many Italian archaeological sites, especially in the Mediterranean area. The loss of interest of direct users for the archaeological heritage is founded on various reasons, and many of them are related to its obsolete fruition methods. In fact, the rules of use have changed.

Fig. 1: The archaeological area and its context.

The aware management of the cognitive process-oriented fruition needs a new form of planning where technological experimentation, coupled with the creative act of design, enhances the identity of places and contemplates integration to architecture of the historical, cultural and social characteristics.

Therefore, an illuminated designer can introduce, in the composing process, the understanding of the intrinsic value of the archaeological site on which it is exercising its design action. Preserving matter is essential so that the cultural heritage could be object of a valorization design.

The iter starts from the knowledge and leads to the conservation and enhancement of the archaeological site.

The contribution of Architectural Technology orients definition of requirements for use of structures, choice of the most efficient technological solutions and explicit standards of comfort and performance that design wants offering to users.

So, design can follow different approaches respecting to the characteristics of the archaeological heritage (presence / absence of the excavation), methods of preservation, methods of protection (ie use of roofing systems performing the functional point of view but also energy and bioclimatic).

The types of use to the public of the findings (by the procedures of lining out up to the most advanced technologies of virtual archeology).

Actually, they must respond to different needs, but above all we must understand that the "Cultural Heritage" must be increasingly aimed at communication skills, using a "language of the market" so as to extend the product within reach of an increasing number of consumers-users, naturally preserving its safety.

This experimental design on the archaeological site of the Early Bronze Age Village of Nola, aims to test the validity of the design methodology integrated technologies of the Information Society for the realization of archaeological museums "open-air", which provide for, among other things, reconstruction efforts with educational and training purposes.

For the peculiarities of the site and the current conditions of partial flooding due to the rise of the aquifer, the technique of preservation of the admissible is the practice of backfilling: a choice only seems defeatist that offers stimulating insights from the reasons given both institutional design and technology.

The issue has been addressed from different points of view, in order to put in evidence opportunities in terms of experimentation related to this conservative approach, with a particular interest in the contribution of multimedia and virtual technologies. It is founded on a methodological apparatus using user needs and requirements of information tools.

This proposed design has been carried out taking in account those objectives, and both integration of innovative technologies and attention to the bioclimatic factors have provided the benefit that has characterized the design choices.

The design's main objective is to experiment first at all solutions encouraging conservation and enhancement of the heritage; the adoption of technological innovation and process is essential to a sustainable management of the cultural heritage in our country.

However, the design also demonstrates that the combined application of technological innovation and process represents one of the tools to improve the quality of conservation processes.

2. The technological design²

The Early Bronze Age settlement in the locality Cross of the Pope is located at a depth of about 6 meters below the current campaign level, but the aquifer of Nola's agro is submerging it. [1]

The uniqueness and originality of the finds has engaged the technicians of the Superintendence for Archaeological Heritage of Naples and Caserta not only searching new methods of excavation, but also experimenting complex and innovative techniques of detection and safety.

Actually, the excavated area is about 1500 square meters.

The design has as a primary need to protect the archaeological heritage that, if left in the same actual condition, runs the risk of being consumed both by groundwater, despite the constant and expensive pumping action, both by weather agents that affect heavily on the coverage that volcanic mud has preserved for thousands of years.

Therefore, the urgent measures are:

- backfilling of the excavate, which actually is flooded with groundwater water and could be destroyed;
- designing of suitable fruition system, with a museum, equipment and protective services and access;
- ensuring the dissemination of knowledge about the historical and anthropological values of this site.

This design converts the park into a large container of functions and connections. In fact, it is divided into four areas, organized according to different purposes of educational, recreational and fruition, and different categories of users: groups or general tourists, specialists and children. [9]

Fig. 2: The Archaeological Park of Nola: plan and fronts.

The design of fruition structures follows the bioclimatic criteria, starting from the preliminary analysis of the climatic conditions (daylight, natural ventilation, rainfall) and the topography of the site.

These environmental characteristics, in the next project phase, become resources for the appropriate arrangement of the interior and exterior spaces.

The model implements the bioclimatic architecture principles, reducing the demand for energy, improving comfort and integrating the structures in the archaeological site, without being too invasive.

These structures optimize energy relations with the surrounding environment, constructive choices and structural properties of the materials used and the size and orientation of glazed surfaces.

So, they guarantee environmental conditions of indoor comfort, based on their morphological characteristics, distribution, size and material.

The main "rules" of the technological design of the various units placed in the site are:

- typology: lightweight and minimally invasive structures;
- location, orientation and shape of the building: the structures are located so that it can be exploited to better direct solar radiation in winter, with large windows, oriented to South, equipped with selective screening systems to protect the glass surfaces in the summer season, and closed and insulated walls, oriented to North;
- natural cross ventilation;
- use of eco-friendly materials (natural and unsophisticated);
- use of renewable energy sources: energy supply is ensured by photovoltaic systems. In particular, the roof is a photovoltaic totally integrated system, consisting of photovoltaic modules waterproof, which use solar cells in thin film of amorphous silicon, which produces energy even at low levels of irradiation, when irradiation is not direct but diffuse;
- reuse of rainwater for irrigation of green areas and for wc.

3. The PAN: temporary structures for fruition³

Starting from the entrance area, a regenerated two main itinerary that lead to all the equipment connected to them, at first info-point/ticket office and bookshop. The focus of the system is constituted by an "Open Museum", that is the re-proposition of the casts of the Ancient Village of Bronze, around which articulates the main visitor itinerary.

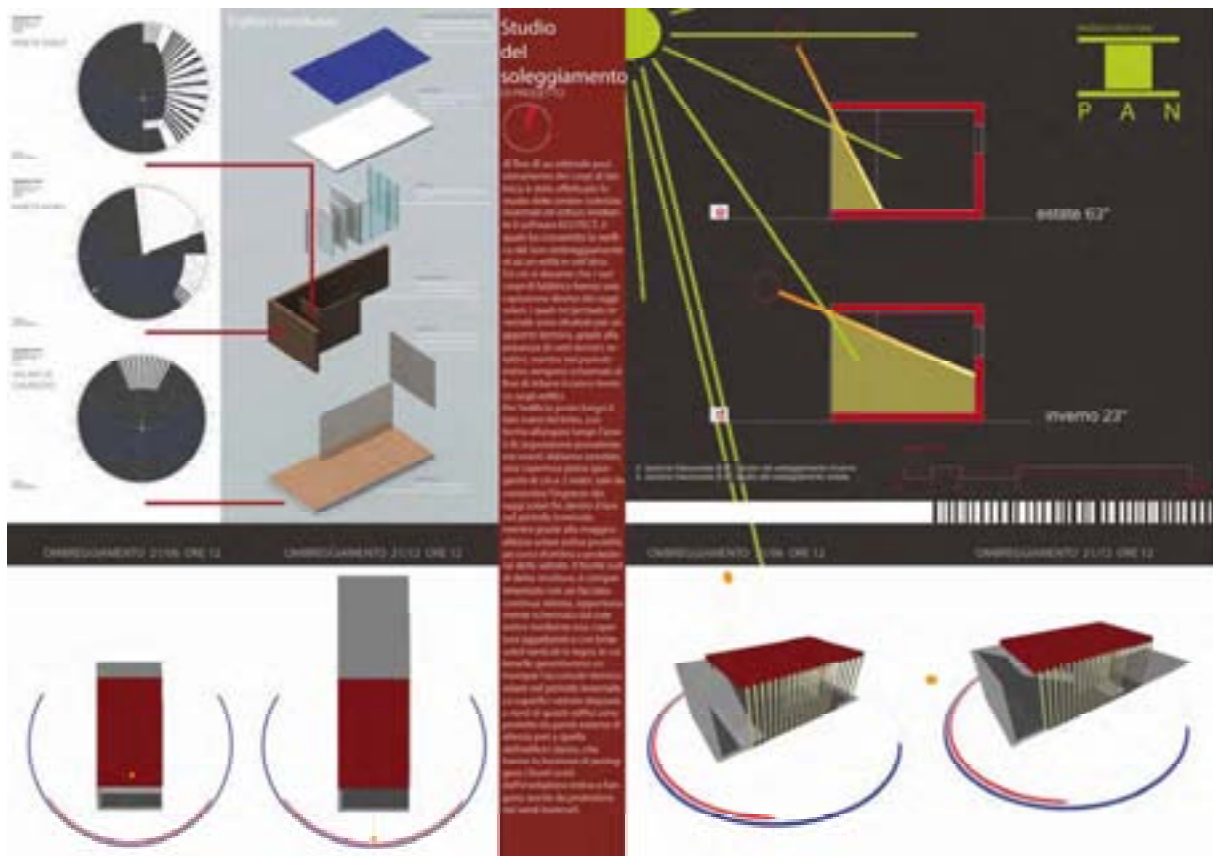

Fig. 3: Design of ticket structure.

The main objective of the project for the Archaeological Park of Nola (PAN) is to create a fruition system and various support structures integrated into the landscape and historical-environmental context of the site [3], always in accordance with the principles of sustainability and energy saving. We will have to avoid having to the support structures of the park a predominant role respect to reality of the site, both in terms of extension and in terms of impact.

All this to better comply with the idea of "diffused museum", that we believe is the most suitable solution to organize in a balanced way a "place" so rich in values.

In brief, with the project of the PAN we want to create a system perfectly correlated between the "ancient" site and the future structure of the area, through essential tools such as visitor routes, "open air" museum, virtual museum and laboratories for teaching and scientific research; all architectural elements conceived and designed in accordance to the basic principles of eco-sustainability.

Architectural design is based on the principles of flexibility in the light of the context in progress of research, reversibility of the process, recognition of the work, absolutely not mimetic (imitative).

The services and activities that will take place in the Archaeological Park will be located in small buildings, called "cubes" and designed in wood, brushed aluminum and structural glass.

These "cubes" have the same generating frame, suitably changed in accordance to the needs of use of the various activities that here take place: archeology and ceramic labs, info-point and ticket office, bookshop, laboratories for specialist research, dining area and museum.

All the above-described units and the systems (plants) adopted for them are linked to design choices of distributive and architectural nature. In particular, each design choice derives from the respect of a few simple "rules" of sustainable building.

The case study has been developed keeping in mind what has just been said. In fact, after a preliminary analysis of the site, it was established the orientation (positioning) and all technical works aimed to energy self-sufficiency of buildings.

For an optimal positioning of the buildings has been realized the shadow study (winter and summer solstice) by using ECOTECT software, which has allowed to control the no-shading of any building on the other.

So, it follows that all buildings benefit from a direct catchment of the solar rays, which in winter are exploited for a heat input, thanks to the use of selective thermal glass, while in summer are shielded in order to reduce the thermal load in buildings.

For the solar shields have been provided for two distinct types.

For the blocks allocated along the west side of the site, with elongated shape along the south-north axis (exposure is mainly east west) has been provided a flat roof protruding about 2 meters.

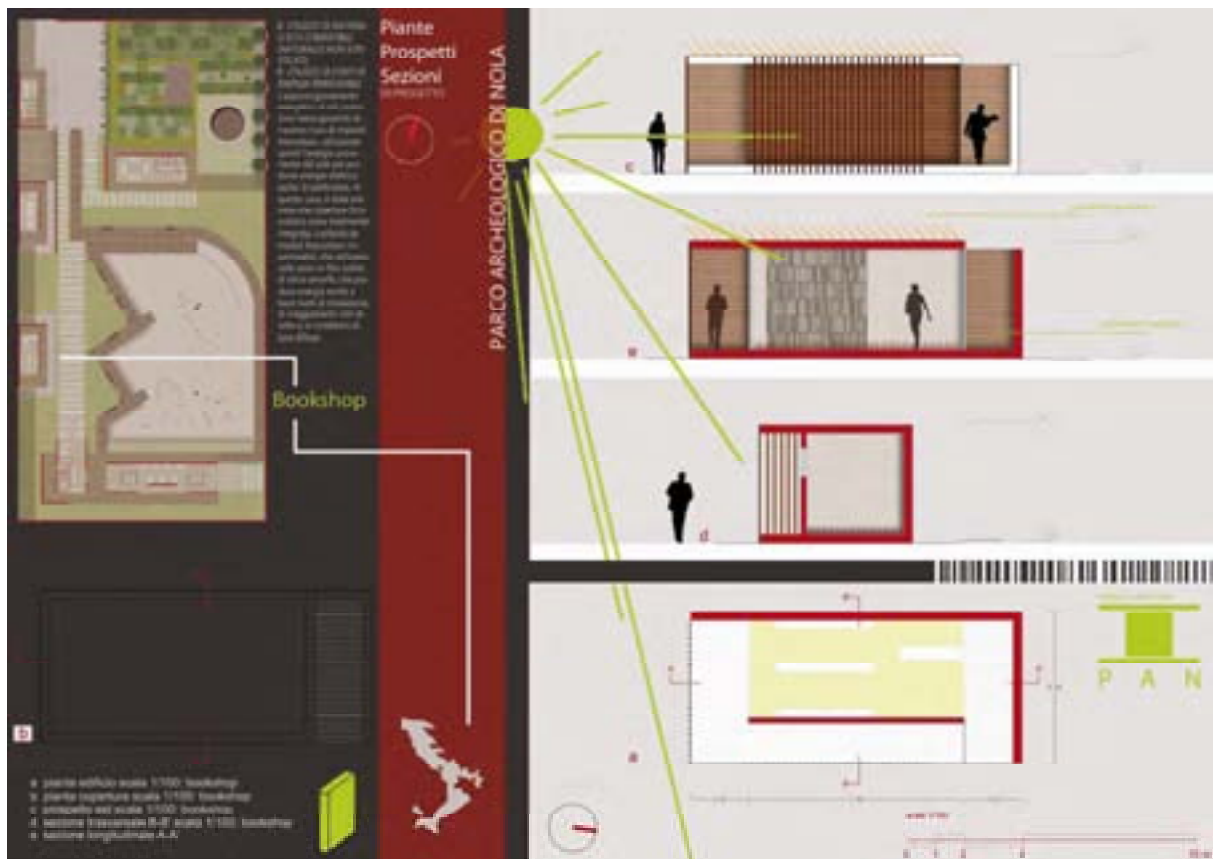

Fig. 4: Design of bookshop structure.

To allow the input of solar rays during the winter, while in summer, thanks to the greater solar height, it projects a shadow to protect the windows. The south facade of these structures (to be allocated to info-point, bookshop and research), is composed of a glass curtain wall, properly screened from the summer sun by an overhanging roof and brise-soleil with vertical wooden slats which guarantee however the solar thermal storage in winter.

The surfaces exposed to the north of these buildings are protected by external walls of the same height as of the building itself, which have the function to protect them from the cold and wet prevailing winds in winter.

With regard to the multipurpose area and the experimental laboratory. These were designed with arrangement of the modules of elongated shape along the East-West axis, with closed walls to the north, glass walls the south, which allow the penetration of solar radiation in winter, and they are screened in the summer thanks to the roof that protrudes about 2 m by creating shadow zone on the windows.

Regarding natural ventilation, it appeared that winter prevailing winds come from the North and Northeast. Essentially, it is cold and wet winds, adequately shielded by a windbreak made with a double row of evergreen trees (winds are screened by the foliage) and a hedge (that prevents the passage of the wind in the lower part).

The prevailing winds in summer, however, have been exploited for cooling and dehumidification, as can be seen from the graphs of the buildings. Moreover with ECOTECT Software were analyzed the frequencies of the prevailing winds that effect on each block, in relation to the winter and summer season.

For photovoltaic, it was assumed an integrated system that is well suited to the flat roof of the blocks of the whole area of the park. It was chosen a photovoltaic panel with excellent performance and technologically "innovative". It is a fully integrated photovoltaic system, suitable for every type of roof. The PV module is composed by a photovoltaic laminate combined with an impermeable membrane, industrially or in the site.

The modules of the flexible type, consisting of solar cells in thin film of amorphous silicon, are capable of producing energy even at low levels of insolation, indirect irradiation or in diffuse light conditions. Moreover, the system has a lower waste of efficiency with the increase of temperature of the cell.

In order to reduce energy consumption, a particular attention has been focused on the design of the envelope of the structure, inside which, using appropriate materials, it is tried to achieve values of thermal transmittance contained within the maximum transmittance values as provided by Decree No. 311/2006. To obtain this result the partitions were examined individually.

Abstract

An interdisciplinary pedology and architecture research started aiming at identifying, restoring and repaying dignity and value to those we call “agri+cultural” Borbone sites. This investigation deals with the so-called “Fan vineyard”, once at the mountainside of San Leucio (Caserta). Through advanced GIS-based interpretation of original maps and bibliography sources, the “Fan vineyard” has been redrawn in its initial topography, and its running pedo-agronomic and microclimatic features have been gathered. The redrawing of the “Fan vineyard” has been possible thanks to the comparison of historical and actual maps and through the identification of traces still visible in the actual landscape design. The “Fan vineyard” was a paradigm of a cultured and rational view of landscape architecture that, as hinted by its appellation, projected the natural site geomorphology on the emblematic “cult” object of the baroque aristocratic elegance. The “Fan vineyard” also was highly productive, since it flawlessly fitted a hill hollow with volcanic fertile soils (Humic Haploxerands). The “Fan vineyard” plan replicated a fully open fan with 11 ribs, whose pivot overlooked south-east. The optimal combination of soil features with a beneficial microclimate created the prerequisites for a satisfactory grapevine cropping, growing 10000 vines belonging to 10 different varieties.

Keywords: “Fan vineyard”, Borbone House, agri+cultural heritage, applied pedology, LIS-GIS

1. Introduction

The Tifatini Hills are a small calcareous pre-Apennines chain, bordering to NE the Campania Plain within the jurisdiction of Caserta province. It spans about 15 km from Capua (NW) to Maddaloni (SE) behind Caserta town (Fig. 1), the natural backcloth of the celebrated Royal House.

The Tifatini Hills guards one of the most diversified and original environmental and cultural Italian heritage. It represents the valuable legacy of various people and dynasties which, from Oscan to Borbone House, determined the structure and configured the evolution of the inner Campania Felix.

In actual fact, the word “Tifatini” reminds the old Oscan name of the oak, while, of all, Borbone House unquestionably exerted the foremost influence on the socio-economic and cultural development of land. They enriched the Caserta surroundings landscape not only with the well-known gems of architecture, but also through a smart and technically advanced reorganization of the agricultural assets, implementing an extraordinarily happy marriage of art and science, with particular reference to pedo-agronomic and architectural sciences.

Fig. 1: The Tifatini Hills from Capua (NW) to Valle di Maddaloni (SE).

The Borbone sites arise as the result of a careful and farsighted policy, which pursued several objectives, the most important from the socio-economic point of view, was the creation of development centers extended to the whole Kingdom of Naples. With the widespread dissemination originate in all the kingdom, Borbone Houses sites are all great architectural projects that contribute all at an even greater social and territorial project. They are all realities that surpass the concept sixteenth and seventeenth-century residences exclusively dedicated to , becoming at the same time production realities not only of goods but of a renewed conception of culture and society.

Careful, in-depth information on Borbone House Royal Sites, and on their role on the socio-economic progress and on the transformation of rural landscape is found in the bibliography [1, 2, 3].

To sum up, Borbone House established that we call “agri+culture” by managing their rural goods under the aegis of the “beautiful and useful”. A foremost, superb model of such a concept is San Leucio, the small “Royal delights” suburb, located about in the middle of Tifatini chain, overlooking the Royal House, of which is the natural prolongation.

San Leucio was the old Castle of Acquaviva Prince, surrounded by wood, vineyards, olive groves, orchards and gardens. It was purchased by King Charles as an amusement site, and progressed by Ferdinando IV, which organized the manufacturing industry, built the village for factory workers, and structured the whole hilly land system including San Leucio, Montebriano and Montemajulo as a farm complex, managed with a surprising modernity and a commendable long-sightedness.

1.1 Aims

Unfortunately and deplorably, at present times most of those we call “agri+cultural” Borbone places are fully ignored even by Caserta Royal House visitors. Several sites still languish for forgetfulness or negligence, and others are definitively missing; concurrently, the pleasantly imposing Tifatini massif, once flourishing and hospitable, suffer nowadays severe degradation.

From such considerations, we planned an interdisciplinary research among pedologists and architects, aiming at identifying, restoring and repaying dignity and value, in the present or in the memory, to the “agri+cultural” Borbone sites. This investigation deals with a very interesting record: the so-called “Fan vineyard”, a missing unique paradigm of the attention of Borbone House for both productive and artistic management of soil resources and landscape features.

|--|--|
| ■ San Leucio | ■ Casino di San Silvestro |
| ■ Fan vineyard | ■ Fontana di Atteone |

Fig. 2: The map of D. Rossi (first-half 19thC) (top) as compared to the present topography (down). San Leucio and the past location of “Fan vineyard” are shown, together with “Casino di San Silvestro” and “Fontana di Atteone” (right).

2. Re-drawing and re-locating the “Fan vineyard” by LIS-GIS

The original location of the “Fan vineyard”, and its pedo-agronomic features, are testified by few but trustworthy and precise iconographic and bibliographic sources referred to San Leucio estate: a map painted during the first-half 19thC by D. Rossi [6] (Fig. 2), and the “Platea”, an index of royal goods compiled by A. Sancio (1826) [7] (Fig. 3).

Through advanced LIS-GIS-based interpretation of original maps and bibliography sources, the “Fan vineyard” has been re-drawn in its initial topography, and its pedo-agronomic and microclimatic features time have been gathered.

The vineyard has been re-drawn and re-located thanks to the comparison of historical and present maps and through the identification of traces still visible in the present-day landscape design (Figs. 5a, b, and 6). This was achieved through a software procedure (by Quantum GIS - Open Source Geographic Information System version 1.7) which consists in positioning, by means known coordinate points (control points), the spatial data in their respective positions in the present, real territory, according to a map projection system (*i.e.* UTM 33) and a coordinate reference system (*i.e.* WGS 84).

Using GIS as a tool for graphic comparison of geographic data is fundamental to reconstructing past places. Historical maps often hold information retained by no other written source, such as place-names, boundaries, and physical features that have been modified or erased by modern development. Historical maps capture the attitudes of those who made them and represent worldviews of their time.

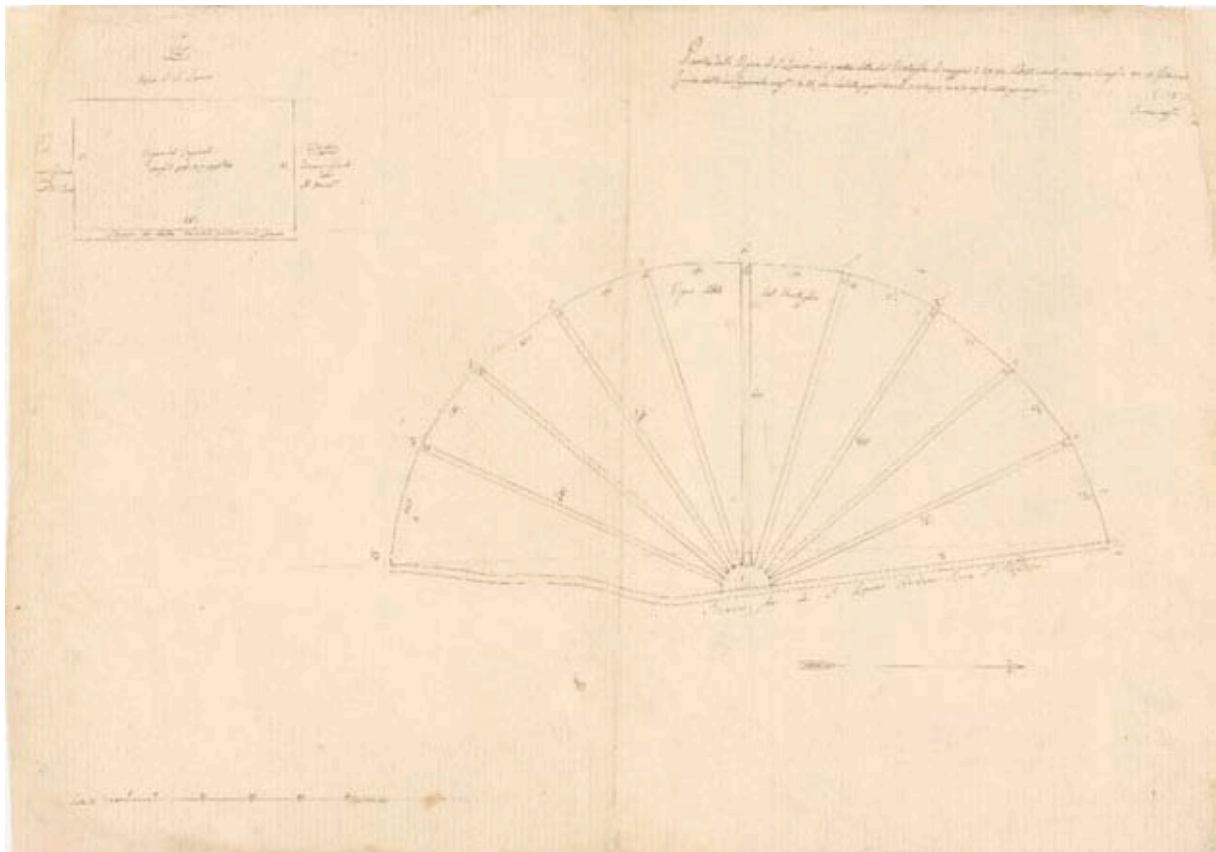

Fig. 3: The map of “Fan vineyard” from “Platea...” by A. Sancio (1826).

Fig. 4: “*La Vaccheria di San Silvestro con personaggi*” by A. Veronese (1818). A part of the “Fan vineyard” is visible at San Leucio mountainside (near the center).

Specifically, we geo-referred three control points, *i.e.* “San Leucio” hill, “Casino di San Silvestro”, and “Fontana di Atteone”, existing and clearly recognizable in both Rossi map and current orthoimage. By casting and aligning such reference marks from the historical to the present images, we accommodated the Rossi map in its true location according to modern coordinates (Fig. 6).

The result was surprising, since the Rossi map almost perfectly overlaid on the present topography. Indeed, it is highly detailed, and it allows to identify and to re-locate, with noticeable precision, the old limits, roots, buildings and pertaining lands of the Borbone site on the current orthoimages. Therefore, it has been possible to make a real comparison between past and present traces (Figgs. 5a, b, and 6). On the historical map, using GIS, has been simulate topography more vividly by using *digital elevation models*, which are raster surfaces composed of longitude (x), latitude (y), and elevation (z) coordinates. We already saw how draping the D. Rossi map over a digital elevation model enhanced the historical map’s depiction of the landscape and morphology on which “fan vineyard” was located. (Fig. 6) Historical maps have a great deal to offer GIS, and GIS brings new techniques to the analysis and display of historical maps.

Through this comparison we can see that the configuration of the mountain on which appears the “Fan vineyard” is the real one, and how some visible traces in the Rossi map are presently missed. As a matter of fact, the outline of the “Fan vineyard” has been lost during time, while the layout of the “Vigna di San Silvestro” and other small paths still retain.

It is finally noteworthy to consider that the work of Rossi concomitantly shows the elegance of “vedutismo” paintings and the accuracy of a modern topographic chart.

Fig. 5a: The map of D. Rossi overlaid as a transparency to present topography.

Fig. 5b: Old (yellow) and present (purple) traces of “Fan vineyard” (yellow square locates the old fan pivot) and San Leucio estate with “Casino di San Silvestro” (red square) and its guest room (red dot).

Fig. 6: Re-drawing and re-location of “Fan vineyard” from Rossi map to the present topography.

3. Pedo-agronomic features of the “Fan vineyard”

The “Fan vineyard” flawlessly fitted a calcareous hollow, filled by the Campanian Ignimbrite, a sturdy pyroclastic fall (cinder, pumices, and scoriae) erupted during the 1st from Phlegraean Period about 39 ky b.p. From such a substrate, volcanic soils as Andisols developed. In particular, Andisols occurring in the study-area are classified, according to (USDA-NRCS 2010), as Humic Haploxerands. Andisols have a high potential for agricultural production, since they are intrinsically fertile, easy to cultivate, and with good rootability and large water storage properties. Therefore, Andisols are planted to a wide variety of crops, including grapevine.

The “Fan vineyard” plan replicated a fully open fan with 11 ribs, whose pivot overlooked south-east (Figs. 5a, b). This was an excellent location, determining a favorable local microclimate, since grapevines were lighted and heated during the bulk of daylight, and shielded behind, by San Leucio hill, from cold, injurers north and north-westerly winds (Figs. 2 and 5a, b). The optimal combination of a high soil capability and suitability with a beneficial microclimate created the prerequisites for a satisfactory grapevine cropping.

As referred by Sancio [7], the 11 ribs subdivided the vineyard into 10 sectors, each with a different grape variety: from NE to SW, Red Lipari, White Delfino, Procopio, Red Piedimonte, White Piedimonte, White Lipari, White Siracusa, Red Terranova, Red Corigliano, Red Siracusa. The name of each grapevine was carved onto a Bellona travertine stone.

Interesting formation on cropping system, agrotechniques and yielding ability are also available [7]: each sector hosted 1000 vines, amounting in all to 10000, pruned “Italian-style”, *i.e.*, short, as a small tree. Neither other trees, nor other crops coexisted with vines, thus allowing to devote all farmers

energies and cares to vineyard; soil was tilled three times a year, and supplied with horse-bean green manure as fertilizer.

The estate spread 7 "*moggia*", 29 "*passi*" and 2 "*passitelli*". The "*moggia*" ("*moggia*" in the plural) was the old surface measure unit utilized, whose dimension varied from township to township. In Caserta, it matched up 3387.36 sq. m, subdivided into 30 "*passi*" (*step*), each further subdivided into 30 "*passitelli*" (*small step*). Therefore, the vineyard extension was about 2.7 ha.

Indeed, the map scale of the "Fan vineyard" reported by Sancio [7] (Fig. 3) reveals an interesting, surprising oddity: the bars of the linear scale are measured in "*passitelli*", instead of "*passi di terra*" (*ground step*), which was the old official length unit utilized in Napoli, capital of Borbone realm, nowadays corresponding to about 1.94 m.

Indeed, we found that such an oddity just is seeming. As a matter of fact, we conceived that the linearized "*passitelli*" measure should be the square root of the homonymous surface unit. A simple calculation validated our hypothesis: a surface "*passitello*" stretches about 3.76 sq.m., whose square root is 1.94 m. In other words, it appears that "*passitello*" could be also a linear measure unit, as a synonymous of "*passo di terra*", of which besides has the same length. Such a finding is quite original, and it is worthy of particular attention, since it plugs a noticeable gap in the knowledge of the metrology adopted during Borbone House reign.

The wine production was 80 barrels, corresponding to about 2640 liters. Taking into account that it refers to a production of nearly two centuries ago, and that the vine short pruning increases the quality, but decreases the yield, such a wine amount can be easily judged adequate, also when compared to modern production. Indeed, it was even overabundant the requirements of the royal court, so it was partly advantageously sold.

4. Conclusions

The "Fan vineyard" was an exclusive, sophisticated example of a cultured and rational view of landscape architecture that, as hinted by its appellation, projected the natural site geomorphology on the emblematic "*cult*" object of the baroque aristocratic elegance. However, the "Fan vineyard" not only exerted a landscape function, but it was also highly productive, bearing witness to the fact that Borbone House had noticeable skill in managing their agricultural estates. Nowadays, the "Fan vineyard" is long gone, and just a few Bellona stones are left as a memorial of its past *grandeur*.

Our work has been also intended to strongly support the need of a functional/aesthetic (two sides of the same coin) recovery and restoration of the "agri+cultural" Borbone House's sites.

“ Capri style”, a debate over a century. Architecture, environment and preservation in the island of “the Sirens” since the Convention on the Landscape of 1922

Elena MANZO

Associate Professor, PhD

Department of Architecture and Industrial Design Luigi Vanvitelli – Second University of Naples

Naples, Italy

elemanzo@libero.it

Abstract

The focus of the paper is the critical reading of the cultural and architectural events that accompanied and followed the petition promoted in Capri by the Mayor Edwin Cerio in 1920 and signed by many prestigious Italian intellectuals, professionals and politicians.

With the petition, he asked and achieved that the whole island's territory was put under the direct control of the legislation on landscape preservation.

In Italy, it was a period in which the debate on the environmental protection was very lively and it took an official aspect as a result of the famous speech of Benedetto Croce, Public Education Minister, given on 25 September of that year. The effects were immediate and, while the Secretary of the Ministry of Art, Giovanni Rosadi, supported by eminent intellectuals and politician, was working to change the n. 364/1909 law, extending the safeguarding action to the natural beauty, even in Capri public initiatives were promoted to face the neglect and demean in which was the island and to preserve the typical characteristics, colours and unique houses of the places.

These include the prestigious international convention on the landscape preservation, from 8th to 10th July 1922. It aimed to discuss the need that each Municipality adopted regulations to protect the artistic heritage as well as promote the cultural revaluation of Capri.

However, in spite of the expectations, the habit to build without any respect of the so called “Capri style” continued and only in 1939, at the dawn of the important Laws n. 1098 and n. 1497, the landscape plane was drawn up.

Made by a Committee whose President was Gustavo Giovannoni, it is considered to be of the first plans in Italy and has governed the island's architecture until the end of the Second World War, when in order to overcome the exasperatedly closed position, a new more articulated debate, extended for over thirty years, solicited interesting proposals for planning, yet unpublished.

Section

The apparent conflict in the dualism “preservation/transformation”, over the last twenty years, has renewed national interest in environmental issues. The common goal of the ongoing debate and numerous initiatives is the Territorial management in order to monitor and prevent a process of wild anthropization of those areas not yet attacked by building speculation. This is what came out from most of the Landscape conventions, organized in Italy from the one held in Capri in 1993, to the Seminary days “City-Map-Contest-Conference”, resulting in the “Charter of Megaride 1994” and moreover, from the “First National Conference for landscape”, held in Rome in October 1999.

However, we are still far from innovative principles being expressed, by both the European Landscape Convention in 2000¹ and by the interpretation of the conservative intervention as a product of a complex social value, obtained from the meeting of heritage landscape preservation with urban planning, led in parallel with the development forecasts and a correct policy of touristic incentive. Certainly, new methodological and operational criteria have been passed by the Regione Campania², as well as by other Italian regions, as a result of the different disciplinary approaches recently adopted. Analyzing the environmental protection action of strongly characterized historical contexts from a historical point of view, two important cultural references have to be considered: the “Conference in Capri”, organized in 1922 and the Capri’s City Plan, drafted in 1939 by a Committee chaired by Gustavo Giovannoni, which are associated with complex events in the contemporary national environmental field³.

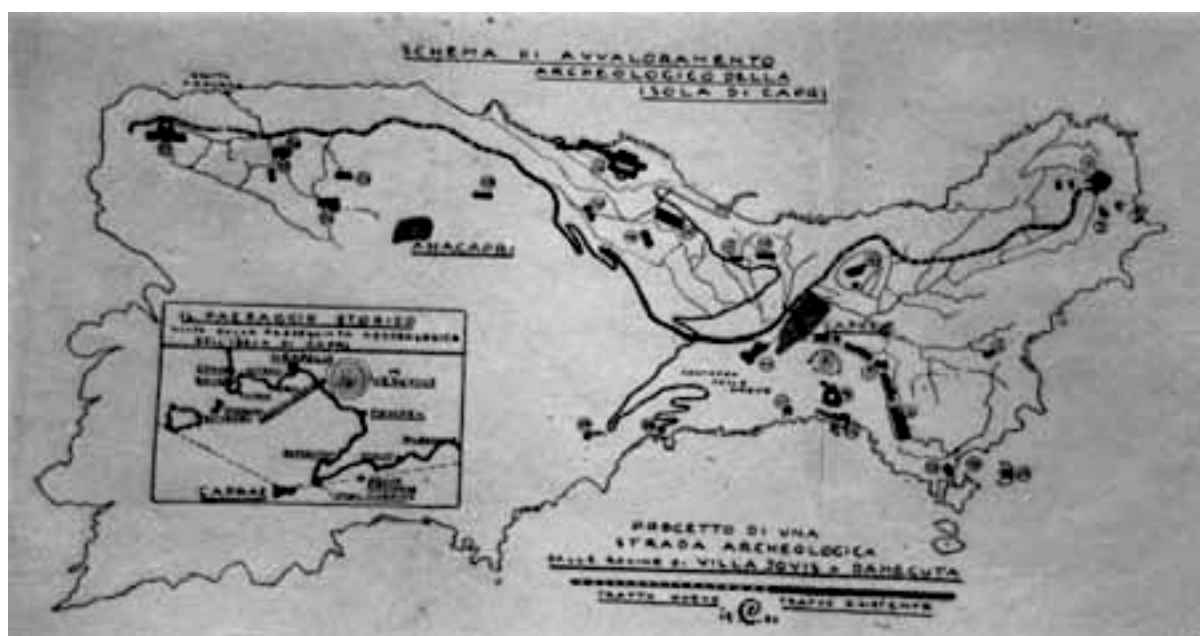

Fig. 1: E. Cerio, *Schema di avvaloramento archeologico per l'isola di Capri. Progetto di una strada archeologica delle rovine di villa Jovis a Damecuta* (in CERIO Edwin, *L'avvaloramento archeologico per l'isola di Capri*, Capri: Le pagine dell'isola, 1921, p. 45). Cerio wrote the essay to found that Capri is not only the island of landscape attractions, but has an important artistic, cultural and archeological heritage.

The plan shows the most important ruins and archeological monuments in Capri and the details of a project for road network between the major scenic charming views and the archeological places.

The two significant events have accompanied and followed the petition promoted in Capri by the Mayor Edwin Cerio in 1920 and signed by many prestigious Italian intellectuals, professionals and politicians. With the petition, the Mayor asked and achieved that the whole territory of the island be put under the direct control of the legislation on landscape preservation.

In Italy, it is a period in which the debate on environmental protection is very lively and it takes an official aspect as a result of the famous speech, given on September 25th of that year by Benedetto Croce, Public Education Minister. The results were immediate and, while Giovanni Rosadi, the Undersecretary for the “Cultural Heritage”, was working to change Law n. 364/1909, extending the safeguarding action to the natural beauty, in the meantime, in Capri, public initiatives were being

promoted to face the neglect and demean in which the island was as well as preserve the typical characteristics, colours and unique houses of the place.

Although the critical reappraisal of that time, brought forward with the right historical perspective, allows us today to single out indisputably private interests, the action to preserve Capri's territorial integrity, promoted by Mayor Edwin Cerio, is able to sensitize public opinion as well as the Government towards the promotion of public interventions. Thus, many Neapolitan intellectuals, professionals, technicians, politicians, along with the inhabitants of the island⁴, sign the petition to point out the intense building, that has followed the Second World War, which was slowly destroying «il colore locale e le costruzioni paesane»⁵.

In fact, Capri, following the temporary depreciation of properties, not only was the object of serious and continuous building speculation, but was quickly invaded by tourism, whose economic values were irreparably impairing the cultural, ethnical and artistic meaning.

Fig. 2: Landscape plan of the island of Capri, dated 1939.

The petition, addressed to Giovanni Rosadi, Undersecretary for the “Cultural heritage” at the Public Instruction Ministry, has a large echo and the consequences are immediate: in the spring of 1921, the Certosa is entrusted to Government protection and, in February 1922, the “Soprintendenza ai Monumenti”, in respect of a draft law to make a national list of natural wonders to protect, urges the Honorary Inspector of “Monumenti e oggetti d’arte” of Capri and Anacapri to file “indicative” files to report and catalogue the major places of landscape interest, because, as Luigi Parpagliolo writes, Government control is possible only: «su quegli immobili i cui proprietari han ricevuto l'avvertimento ufficiale del notevole interesse pubblico di essi a causa della loro bellezza naturale e della loro relazione con la storia civile e letteraria. Basta ciò per comprendere l'assoluta necessità che si compia nel breve tempo possibile l'inchiesta già in corso mediante la *scheda indicativa*»⁶.

Moreover, in that same year, the prestigious International Conference on landscape preservation, is organized from 8th to 10th July. It is the first initiative for “Aesthetic program” of the Capri's Municipality, which has an international eco. The aim is to discuss the adoption of a rule that will protect artistic heritage and promote the island's culture.

Fig. 2: Landscape plan of the island of Capri, dated 1939.

"Il Mattino", one of the main Neapolitan newspapers, since the early days, understands the importance of the Congress and, sensing the future developments, stressed that it was not «[...] uno dei soliti. Niente vaniloqui astratti e vaghi o chiuso e opaco esibizionismo di politicanti e mestatori elettorali ma una concreta e aperta visione e impressione di bellezze naturali, d'incanti mitici entro il respiro storico dei venti secoli di vita mediterranea. [...] Stimolare e illuminare la *tutela* è certo lo scopo principe [...] e, speriamo, non sarà annullato o negletto dalle lentezze e dalla inconcludenza di quella nostra burocrazia [...]. È *tutela* da estendere a tutta la *regione* e, [...] da far valere anche un po' in Napoli»⁷. The results of the initiative promoted by Cerio are immediate and proceed in parallel with the adoption of the draft law "*per la tutela delle Bellezze naturali e degli immobili di particolare interesse Storico*", proposed by Benedetto Croce⁸.

However, the limit of the Conference is the defence of a transcendental landscape, almost fake, completely denied from a social and political context, seen from an idealistic perspective, which lack ties with a reality private initiative and public interests where clashed. In later years, in fact, in the name of a "redesign" of the island and in respect of the so-called "Capri style", construction will continue with Cerio's implicit consent⁹. Therefore, the structural premise of the Conference, merging in useful methodological proposals, asserts the usefulness to catalogue the artistic and natural heritages, the need for a landscape plan and, in particular, point out how the issue of "protection", have to involve private initiatives as well as the local community, in order to be solved.

Thus, when in 1939, Law n. 1497 is enacted, in accordance with article n. 5 of the new rules for the protection of natural and artistic heritage, a Commission, headed by Gustavo Giovannoni, is immediately appointed to produce one of the first landscape plans in Italy¹⁰.

This episode is an exceptional event with innovative meaning, because the need for environmental protection is not felt as a result of the devastating and chaotic phenomena of urbanization, but as a preventive action to protect a landscape still largely intact. The project has given a value of Plan and together with that of zoning and building regulations proposed by Edwin Cerio in 1922, they govern the island's architecture until the beginning of the 1950's¹¹.

Notwithstanding, Capri suffers «una disseminazione dei fabbricati senza alcun legame figurativo» that will significantly damage the island's appearance¹².

Fig. 3: A. De Angelis, Project for a zoning plan of the island of Capri, 1:10.000. July 12th, 1947

In addition, the regulation promoted by Cerio and Giovannoni's plan of 1939, several decades long, will demonstrate at least with regard to economic operators and local tourist, to be too binding and restricting for territorial development. In fact, considerably reducing the index of manufacturability, the plan will significantly increase the cost of housing and building land and indirectly encourage speculation¹³.

In an attempt to preserve "Capri", as the building regulations prescribed, typological differences in relation to the various areas or differences are not established. The constructions of house, that covered the "view" to those which were lower, was not forbidden. Moreover, the buildings so called "terrace houses", such as Villa Malaparte, were hardly ever designed, although unrelated to local taste, they certainly respected the natural image of Capri's coast without ruining the landscape visual¹⁴.

The project of 1939 had planned the ultimate building thickening in the central part of the island and decreasing indicators of construction towards the borders, up to a "respect zone", which prohibited construction all along the coastline. This is a full protection plan, which does not foresee the development of a road network and new constructions in relation to population growth and social transformation.

After about ten years, there is a need for a more modern city plan to organize a global and organic project where the road works, infrastructures, new constructions and renovations find a correct spatial connection.

In 1947, a team of professionals – called "Ingegneri e Architetti Capresi" – composed of Roberto Adinolfi, Angelo de Angelis, Mario di Iorio, Manfredi Franco, Mario Gallozzi, Orlando Gargiulo e Costanzo Lembo, proposes a number of planning studies carried out by each of them to the Municipality of Capri. Among this, two were pointed out to be particularly valid: the project of engineer Mario Gabby - only for the Town of Capri - and that of the engineer Angelo de Angelis, for the whole territory of the island (like a Regional Plan).

Fig. 4: M. Gallozzi, Project for a zoning plan of the island of Capri, 1:10.000. November 7th, 1947.

Both provide, essentially, two types of construction for Capri's houses: «l'architettura delle Costruzioni estensive che debbono essere intonacate con il colore naturale del paesaggio (rocce e vegetazioni). L'architettura delle costruzioni intensive od urbane, che possono avere prospetti a tinte chiare o bianche», because «l'adattamento dell'architettura al paesaggio è soprattutto un problema di colore. Il colore è elemento assai più importante della forma, in quanto che a Capri le costruzioni si vedono a grande distanza [...] e mentre la forma in distanza perde rilievo, il colore predomina e si impone all'occhio»¹⁵.

The idea of environmental protection still exists in various proposals, but, after overcoming the exasperated zoning restrictions of the plan projected by Gustavo Giovannoni, thus translates into a more modern concept of "camouflage" of all suburban buildings.

Some years later, with the Ministerial Decree issued on August 20th, 1952, a new Commission to examine the Landscape territorial plan of 1939 and draw up the draft of a new one that had value of General Regulator Plan is formed. The working group consisted of highly qualified people, chosen from the environment of the urban national culture: the architect Roberto Pane, Professor at the Faculty of Architecture of the University of Naples, the Engineer, Cesare Valle, President of the VI Section of the Superior Council of "Lavori Pubblici"; Felice Mario Campoli, head of Division in the Central Administration of the Ministry of Education, Giovanni Pansini, head of the Division of the General Direction for "Pesca e Demanio Marittimo" of the Ministry of Merchant Marine, Roberto La Francesca, Member of the Presidency of the Council of Ministers. Alberto Nicoletti, head of a section in the Central Administration of the Ministry of Public Instruction was appointed as the Commission's Secretary, while Professor Alberto Calza Bini was appointed President.

This shows how the commitment of a few had managed to arouse the interest of the Government as well as create a concrete and purposeful debate which effects have protected with profit for over thirty years.

The Management Plan of UNESCO Sites: from the conceptual model to the methodology application through GIS

Lina ABATEGIOVANNI

Department of Architecture and Industrial Design "Luigi Vanvitelli", Second University of Naples,
Aversa, Italy
lina.abategiovanni@unina2.it

Abstract

The current guidelines for the development of cultural heritage identify the link between the concept of preservation and protection with that of management as one of the possible development lines. The research sets out below in this article wants to show a synthesis framework on the Management Plans of UNESCO sites registered in the World Heritage List - WHL, which are oriented to the definition and planning of interventions to be implemented over time to maintain the integrity of the values that have allowed for the inclusion of the site on the list, in order to preserve them for the future generations.

In addition, in the document, there are outlined some illustrative and experimental applications of Italian managements provided with universal value and there are developed some considerations about the implementation of the related assessment, control and management tools of cultural heritage through the use of GIS (Geographical Information Systems).

The purpose of the study is to demonstrate that the Management Plans, if properly integrated with the instrumental support of GIS, can provide a mean to support a territorial development model, which has the final aim to take account of all existing resources and to combine conservation with economic development in order to achieve a unique cultural product.

Keywords: Management Plan; UNESCO Sites; GIS; Cultural Heritage; Territory.

1. Introduction to the universal meaning of the Management Plan: identification, methodology, settings

UNESCO demands to the declared human heritage sites and to the registered sites in the World Heritage List- WHL to provide themselves for a Management Plan, a tool to protect the safeguard and preservation of properties that have justified the inclusion in the List in the course of time.

These sites are defined by the presence of a rich cultural heritage immersed in a natural environment and/or in high quality urban localizations. In every of them, the operators are involved in planning, before, and in the production, after, of a particularly complex appreciation process. To face this complexity and to overcome the difficulties that derive from it can be efficient the start up of a planning, organization and control process.

After the implementation of the *Convention concerning the protection of the world, cultural and natural heritage* on 1972 in Paris, thanks to the competitor States accepted the commitment to <<guarantee the identification, protection, preservation, appreciation and transmission of cultural and natural heritage to the future generations>> and thanks to the following *Budapest Declaration* in 2002 even Italy moved towards this direction, making necessary, with the *Law 77 on February 22- 2011*, the editing of the Management Plan which the main target is "to guarantee the identification, safeguard, conservation, appreciation and transmission of heritage to the future generations".

The prevision that the elaboration of the Management Plan of the sites represents a necessary equipment has the purpose of guarantee a protection and continuous defense of properties to achieve the standards and the indications contained in the Budapest Declaration of 2002, with which the

UNESCO World Heritage Committee (WHC) have invited the member States of the Organization to strengthen the protection initiatives of the global cultural heritage, incentivizing the effective protection of single properties that are already registered (or wished for the registration) in the World Heritage List, to guarantee a just balance between preservation, sustainability and development of various sites that are considerable not only on the cultural plan, but also on the economic and social one.

The Management Plan of the UNESCO sites represents an essential tool for the management, protection and appreciation of the Heritage. It allows the planning, in a strategic view, of actions and activities to be implemented so that the site, identified as Human Heritage, could guarantee its preservation as a statement of the history of civilization and could become a place where meeting and exchange of knowledge occur, in the wide net of worldwide sites.

The Management Plan is suggested like a political and economic administration tool of the site in the middle-long term, it can facilitate and drive the conception, the planning, the realization and the control of safeguard projects and appreciation of heritage.

Its first purpose is mainly explained by the planning of cultural initiatives for protection and preservation supported by appreciation actions, mainly, in the short-term, with a relevant economic impact on the territory.

The Management Plan of a UNESCO site is built on primary basis that recognize the universal value (statement of significance) that makes the site a unique or provided by extraordinary worldwide value place. It's about the motivations that have allowed, or that could allow to new candidates, the inclusion of the site in the World Heritage List.

To formulate a Management Plan is necessary follow a clear process without which you risk to generate a less structured document that doesn't contain the suitable tools to weigh on preserved properties and doesn't select the options to use for the local economic development.

The definition of an efficient tool for managing the historic, cultural and environmental resources of a given territory is the main target of any project to appreciate a certain geographic area, which is explained in the identification of exact addresses of knowledge, preservation and appreciation, directed to the development of these resources and territory.

The Plan aims at defining the "local development model based on culture", defining a management system that, starting from the analysis combined with the conditions of places, considers the ongoing alterations and the opportunities of preservation and appreciation; so, it defines the possible future achievable scenario articulated in targets and in options of intervention, it evaluates the repercussions on the local system and then chooses the strategic plans that better fulfil the goals. Finally, on the basis of suitable indicators it supervises the realization in the time.

It has the end of guaranteeing an high level of protection of eminent property, but it must also encourage the integration with the plans and programmes oriented to the local development.

During the training process of the Plan it is needed, on the one hand, the building of the awareness for the value exhibited in the site and on the other hand, starting from these values, it is needed the definition of the local development project which outlet is the production of the culture.

The National Commission for UNESCO World Heritage Sites and Local Tourist Systems, established at the Ministry of Heritage and Culture, to support local actors in the preparation of management plans, has prefigured a plan model that considers the UNESCO sites as "active sites that produce contemporary culture", places then able to promote over the protection of property and cultural identity, the development of cultural activities in the supply chain and productive activities and services related to them.

It has tried to respond to the need expressed by UNESCO, developing a methodology that can serve as a guide for the implementation of management plans for all Italian sites.

A uniform methodology, shared and coordinated ensures an exchange of knowledge and virtuous practices that enhance the overall capacity of the Italian cultural system.

The innovative aspect of the developed methodology, compared to the demands of UNESCO, is summed up in the concept of "integrated approach" that combines the need to protect and preserve the sites with the needs of socio-economic development of its territories. The Management Plan, therefore, moves its boundaries, integrating both horizontally (from the individual assets to the reference area, even beyond the UNESCO site) and vertically (from the knowledge to the economic appreciation and communication). The appearance of the enhancement, in the cultural and economic meaning, then becomes a relevant part, particularly in light of the importance that the heritage may have in our country in supporting the development of local economies.

The formation of the Management Plan should therefore have a basis for a methodological approach able to closely combine the recognition of the value of the property subject to protection (and the actions required to properly preserved) with the construction of a local cultural development which is the added value that can result from being included in the list of World Heritage property and thus from being, as such, most recognizable in the global network of the cultural offer.

Hence the Management Plan can be a tool to trigger or support a model of territorial development that has the final intent to combine conservation with economic development in order to create a unique cultural product.

In fact, the management plan has its own autonomy and a procedure that aims to establish a model for local development based on culture but also to plan activities to meet the demands of UNESCO.

The Management plan defines how to manage the resources of historical, cultural and environmental nature, and it is able to guide the instruments of urban and economic planning through knowledge, conservation and enhancement.

Under this perspective, the Management Plan helps to coordinate schedules for all other: to maintain and to enhance the integrity of the values that have allowed for the inclusion in the WHL; to combine the protection and preservation with the integrated development of resources area of the local economy; to make compatible a local process shared by several organizations and authorities, who may also have conflicting interests.

In other words, the plan defines a management system that, starting from the values that motivated or will motivate, the inclusion of the site in the List of World Heritage, it performs an integrated analysis of the condition of the places identifying the forces of change in place, then it identifies the future goals that can be reached through the intervention options and possible strategies, it assesses the likely impacts on the local system, it chooses the action plans to achieve the targets it defines the procedures for coordination and implementation and it tests achievement through a series of indicators that implement systematic monitoring of results over time.

The Plan also constitutes a "declaration of principles", through which the authorities responsible for the management of sites and communities to which national and local sites belong, are committed towards UNESCO and the entire humanity to an active protection. It is therefore considered as the plan the document that informs on the state of cultural heritage, it discovers issues to be solved for the conservation and enhancement, it selects how to implement a system of actions, a policy of sustainable local development, evaluating, systematically, the results.

The territorial setting Management Plan should be read according to a double conceptual level: the first concerns the core areas, the "territorial setting registered", that is one that identifies the asset entered in the World Heritage List and which coincides with the perimeter proposed at the time of registration at the above list and its buffer zone (a sort of buffer zone or "bearing" of protection), a limit perimeter recognizable from physical and administrative elements, and the second part identifies the "extended territorial setting", or that of its dynamic areas of cultural phenomena, dynamics and logics often spontaneous aggregation of economic phenomena, related to the development, that affect the surrounding territories, thus making reference to a concept of larger territory.

It's about two categories of territory, but also of two logics: the procedures for its administration of the territories and perimeters, that one of process of its enhancement projects that are difficult to adapt to predetermined perimeters, but whose boundary is the boundary itself of the action and perimeters depend on the content of the development project.

Ultimately, the Management Plan for UNESCO sites is a tool to address that draws its strength from the fact of not being standardized in content. This characteristic allows it to adapt to the territory, seen as an integrated environmental, landscape, cultural, social capital, traditional mosaic, making its own, the critical elements and serving as a tool of interpretation and implementation of plans and programs at the local level mandatory.

Not the secondary is the fact that the Management Plan highlights the concept a network between the UNESCO sites, at the administrative, territorial and also procedural level, involving public and private interests, organizations and residents, so that the territorial development is homogeneous and brings benefits to all those who are part of the regional system.

This is the first step because the territorial-cultural system is a real engine for development. The Management Plan for UNESCO sites, for these reasons, it is a valuable and indispensable tool, if you want that development is continuous and oriented to sustainability.

1.1 The importance of monitoring within the management structure of the Plan

The monitoring consists of the management phase of the Plan. The objectives of this phase aim for verifying the compliance of the actions themselves with the obtained aims with the application of management measures specified in the instrument of planning.

As part of the Management Plans for the UNESCO sites, the purposes of monitoring are aimed for evaluating the effectiveness of actions provided for the achievement of the objectives for enhancement, on the one hand, and protection, on the other hand, the regional and cultural system.

In other words, the monitoring system of the Management Plan has the primary aim to draw the attention to the management structure of the UNESCO site the overall progress of the planning activities, promptly reporting any critical work in progress and allowing you to take remedial actions to management that are considered necessary to achieve the planned objectives.

There are two types of monitoring: the first type of monitoring is focused on the implementation of the Management Plan and therefore on the revelation of indicators that are spread to the management structure through the reporting system, they can process the appropriate corrections to the existing Management Plan, and the second type of monitoring is based on the detection of the impacts of the Management Plan in the medium-long term, through an appropriate system of indicators and reporting one, which provide the promoting of the Management Plan the necessary feedback for the elaboration of the new Management Plan.

The reason why the monitoring is really useful to the planner, it is necessary to develop an appropriate set of indicators, designed to provide you with enough rigor and scientific information that can be used, both at the end of the "life" of the Plan, and during the various stages of implementation of measures contained therein, to assess their effectiveness, and, if necessary, to recalibrate target and / or actions on the basis of the obtained results.

The guidelines issued by the Ministry of Heritage and Cultural Activities suggest that indicators have the following characteristics, that is: being little, being relevant to the problem, valid, simple and easy to use, and based on existing data and easily achievable.

Also according to the Ministry of Heritage and Culture, it is clearly defined: a set of outcome indicators; the time interval that must exist between a check and another, a scale for the assessment of performance indicators collected (typically scales are used between 1 and 5).

The preparation of the set of indicators and of the monitoring system allows you to regularly report on the activity of planning. These reports are used to make the point about the state of implementation of the responses, so to check whether the time schedule has been respected in their implementation, to assess the real answers, and compare them with the potential answers provided at the time of formulation of the answers themselves. If the real answers are lower than potential, the targets can not be achieved: in this case, it is necessary to change the answers, in order to make them more effective, or you it will necessary to resize the objectives.

Other determining factors for monitoring relate to the construction of complete historical data, useful both for research and for future planning activities and making transparent the work of decision-makers, in order to allow the citizens to understanding, even in perspective of awareness and information, as well as to promote the formulation of suggestions and constructive criticism.

The monitoring and constant verification in the implementation phase of the Management Plan will therefore be an ongoing control of the effectiveness of the plan. The monitoring system must be based on the reiteration of the data relating to the territorial system and acquired from the database.

The monitoring of the Management Plan will ultimately compose of two different levels of control:

- check of the progress of the selected projects and possible achievement of objectives. The actions will be monitored in collaboration with the promoters of each project through control of the identified indicators. The tests will also be useful to highlight the efficiency of the projects and their possible replacement and / or increase.

- check the effectiveness of the Plan and survey of the mid and long term impact on the territory. Considering the complexity of the site, the originality of this management tool and its importance to achieve the coordination and shared management of the cultural heritage and landscape, it is considered worthwhile, in the first phase of implementation at least, to carry out a biennial examination of its effectiveness. In this way the Management Plan will be updated and adapted to the processes of change in the reality and to the specific needs that will arise.

The preparation of the Management Plan of the site should be observed as starting point tool rather than as an administrative act which ends the application process in the WHL of UNESCO.

As each document of programmatic-planning nature it is a "tool", in the sense that it must be really useful in achieving the two strategic objectives required by a subscription of the WHL, that is the protection / preservation of the property and its fruition on a global scale.

So being a "tool" the Management Plan has an "utilitarian" fruition, that is if it is able to activate the processes to achieve two strategic objectives it should be maintained, on the contrary it must be changed. This means that it is absolutely necessary to monitor the effectiveness of the management Plan with respect to its management architecture and, above all, the way in which it is applied from the actors involved in the management.

In fact it is need to find a virtuous balance between quality of the instrument of the management Plan and application efficiency of the same.

2. The network of good management practices of UNESCO Sites in Italy

Italy is actually the country holding the major number of sites including in the human heritage list with its forty-seven sites, following by Spain and China.

Starting from the major international experiences, particularly english ones, first italian sperimental applications were related to management plans of late baroque towns belonging to *Val di Noto* in Sicily (including eight late baroque towns of Caltagirone, Catania, Militello Val di Catania, Modica, Noto, Palazzolo Acreide, Ragusa e Scicli) and *Val d'Orcia*, a wide valley situated in Tuscany, in the province of Siena.

Between other sites that have edited the managment Plan under candidacy, there are the seven *Sacri Monti* (sacred mountains) of *Piedmont* (Belmonte, Crea, Domodossola, Ghiffa, Oropa, Orta and Varallo) and *Lombardy* (Ossuccio and Varese), groups of chapels and other architectural manufatcuring were erected from XVI and XVII century; the *Etruscan Necropolises of Cerveteri and Tarquinia in Rome*; the *Rocky Necropolis of Pantalica in Syracuse* (Fig.1); the *Strade Nuove and the system of the Palazzi dei Rolli in Genoa*, homogeneous urban spaces belonging to late renaissance and baroque age, supported by more than one hundred civic titled families that symbolize a special titled residential parceling model left in the centre of modern city.

Between the italian sites earlier registred in the WHL that are provided with Managment Plan today there are: *rock drawings in Valcamonica*, a Brescian valley of italian side of central Alps that includes an unusual sets of iconographic documents that allowed to follow the cultural evolution of Camunian Civilization during the centuries; the *Historic centre of Florence*, closed inside of the boulevard circle traced on the old medieval walls; the *city of Vicenza and the Palladian Villas of the Veneto*; the *archaeological area of Agrigento*, one of the most important city in the mediterranean world which supremacy is still clear in the ruins of wonderful doric temples that ruled the old city; finally the *city of Verona*, a wonderful example of a city that gradually and continuously developped during two thousand years, integrating sterling artistic elements of different periods that have followed. It exceptionally represents the concept of the city that fortified itself during different phases in the european history.

Fig. 1: From top to down: View of Val di Noto; Val d'Orcia and rocky Necropolis of Pantalica.

Fig. 2: Localization of UNESCO Sites in Campania based on orthophotos.

That which combines the different management tools just quoted is a common methodology able to complete the analysis stages (awareness), design (conception), management (action), evaluation (feedback) and able to renew the purposes of preservation of the site's values during the time in the light of latest considerations that assign a role to the cultural heritage, more and more important, in the development model's framework based on local identities and on appreciation of land endogenous resources.

In the case of Campania Region, there are six sites in the WHL (Fig. 2) and they relate the *Neaples historic centre* (1995); the *Royal Palace of Caserta dated XVII century with the Park, the Aqueduct of Vanvitelli and complex of San Leucio* (1997); the *archaeological areas of Pompeii, Herculaneum and Torre Annunziata* (1997); the *seashore of Amalfi* (1997), an extraordinary example of mediterranean landscape with its special natural and cultural values that derives from its complicated topography and its historical and compatible adjustment process served by the community, a shiny example of an intelligent resource's use; the *National Park of Cilento and Vallo di Diano* with their archaeological sites of *Paestum* and *Velia*, and the *Certosa di Padula* (1998). Not least *Benevento* and the *Church of Santa Sofia*, a registered site in the World Heritage List from UNESCO on 25 giugno 2011. It's about of a sequential site including seven places abundant of architectural, pictorial and sculptural depositions of longobardic art, which candidacy was accepted in march 2008 with the name "*Longobards in Italy. Places of the Power (568-774 A.D.)*".

To this day the Campania sites aren't provided with a defined and complete management tool, but there are various tests in progress for editing an incisive management model and it's remarkable the necessity of increase the attraction of the artistic, historical and architectural sites in Campania with the purpose to realize some local tourist nets and original management models.

3. Manage, enhance and represent knowledge of cultural heritage through GIS technologies

The use of GIS technology (Geographical Information Systems) as a tool for cognitive survey of land and cultural heritage, has as its main objective to achieve a level of knowledge of the resources appropriate to their effective management, as well as to create and implement a management system of data and information that would allow it the simply filing, consultation and updating through a flexible database, constantly updated and adjustable.

The axis of knowledge is, therefore, the priority phase of the definition of a Management Plan, and the collection of data related to resources of the territory allows, in fact, the identification of correct programs for the protection and conservation, as well as coherent projects for enhancement.

A such analysis should consider, in relation to the analyzed resources, even a whole series of data useful for the definition of the applied protection measures, the state of preservation of the single elements that create the property, disturbing elements interfering with the property and the other possible resources that can be related with it.

It is evident that it is possible to collect and to relate a wide amount of data only by defining a unique method for acquisition and encoding of the data and an information technology support that will allow effective connection.

As it is well known for a long time, the Geographic Information Systems (GIS) are meeting these needs by offering the ability to associate a large amount of information to a precise and geo-referenced thing in the territory, linking them together and making them immediately availability and update.

The growing interest in Geographic Information Science combined with the success of increasingly sophisticated GIS technology has greatly encouraged the development of new fields of application for the management which Geographic Information Systems have showed an effective and irreplaceable tool. These circumstances have defined the development of new techniques, thus making possible the use of GIS applications in fields until recently unexplored, able to satisfy the most various demands not only from the world of scientific research (environmental local analysis, geostatistical processing, assessment) but also in terms of planning and development of the area.

Applications conducted with the use of GIS have resulted in the creation of thematic maps, which represent the essence of the system, from which it is possible to grasp, analyze, solve, critical situations of environmental, social, economic, anthropogenic nature, or all those situations related to the evaluation, control and management of a territory.

Through these instruments is therefore possible to interface and connect their diversified data, read in overlap, they can provide more information, reveal themselves useful for a better understanding of the reality in question and become a starting point for protection. But like any tool, GIS must also be properly designed in order to fulfill the objectives that have been outlined just above.

The structure of the information system is proposed to use for building of the database of a management plan that can be organized in a hierarchy both in the definition of the different levels or layers of knowledge, and in the identification of specific resources that can have different consistencies, from individual architectural assets, to the individual environmental resources.

The information system of the Plan must incorporate every possible information, in the form of data, reports, maps, drawings and photographs, to understand the condition of things of the Site and the causes that explain the ongoing changes. This first analysis of the heritage of the site provides an updated overview of the status quo divided into categories of assets to implement in a GIS.

A GIS, therefore, is composed of, a series of layers or information layers or even thematic layers (Fig. 3). This means that, having to represent a set of subjects on the same geographic area, it is possible to create a series of layers for each theme and then superimpose them as required and in the required combination.

The first step towards the realization of a GIS is the identification of the digital base map. The base map, as the name suggests, will serve as a basis on which to place the different informative layers (layers) each describing a theme.

Often this results in an overlap of themes and therefore arises the need to use transparent networking symbolizations, offered by the GIS in order to allow the vision and the overlap in the cartographic representation.

In addition, the geographical element contained in a large part of the commonly used data can transform this data into geo-information, a new type of knowledge linked to the territory and its physical, environmental and socio-economic dynamics.

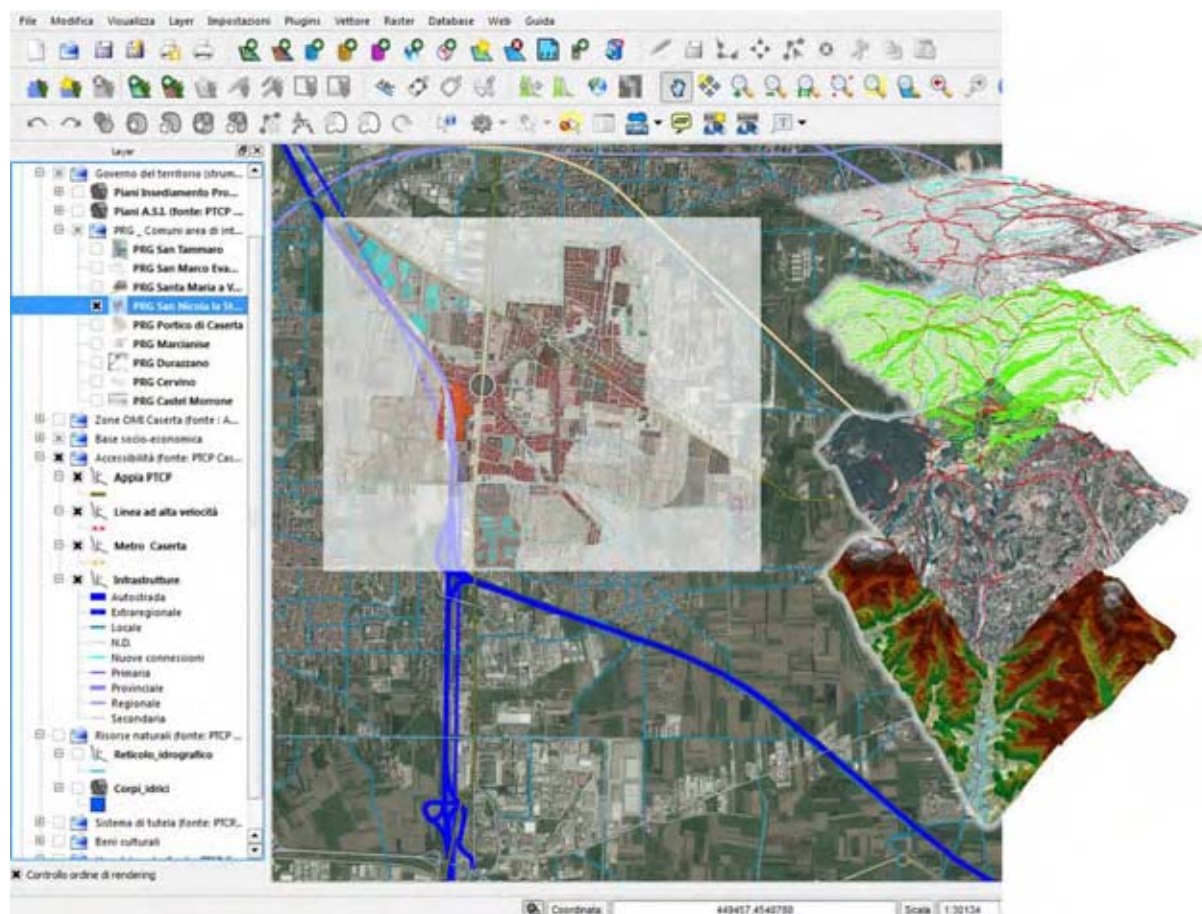

Fig. 3: Example of a overlapping about the different territorial layers within a GIS project (through the use of software Quantum GIS – QGIS 1.8.0).

Geographic Information, considered not only as an end to itself data, but as a series of information introduced in a wider geographical area and especially related to the socio-economic context, it helps us to enter the world of the geographical representation of the many aspects that constitute the socio-territorial around us.

Almost all of the data and information, useful to any type of analysis or study, have a geographical element that the GIS tool is able to capture and highlight making possible the analysis of the same data in an unexplored context that has the merit to show new aspects and correlations between the information related to the area.

Any type of data, therefore, contains in itself a geographical reference: it contains the position in space and time. Any given data from a simple number or value, can thus be transformed into geographic one, once equipped with geographic coordinates, then which position it occupies into space the numerical value of the data itself, which position it occupies in time, attributes etc.

The main attraction of the GIS tool, especially in relation to Management Plans of the UNESCO World Heritage Sites, is the ability to hold everything in many information and data even very different between them, such as maps about the use of land and, cadastral maps, orthophotos, topographic maps, satellite images and tables in Excel that, once integrated into a GIS, give the opportunity to non-experts, to be able to make judgments and / or forecasts related to the management of the territory.

A simple pair of geographic coordinates can not certainly be a useful information to any type of study, but if a number other numeric, alphanumeric and statistical value is tied to this pair of coordinates then the geographical data becomes information. If the whole is then represented on a map by means of the technologies offered by GIS that the use of this representation of information instrument becomes very ample and with very high potential.

The construction of a GIS implies the definition of technologies that enable the integration of data, different from each other as well as the development of functions in turn dictated by the needs of individual users.

Once built the GIS according to available data and the required objectives, it can begin the research phase and especially the data analysis.

A GIS allows to make simple requests for data by the "point and click" method (the action/function of positioning on a specific point of an object, click and get, for example, information about that object) on

the available thematic map, providing also useful tools to the analysis of temporal data such as the construction and graphic restitution of the time series, over the spatial analysis of the data.

Any process of analysis, enhancement and management of the resources of an area that aims to be accepted on the political, social and economic level, must be supported by data and information relevant to the purpose and must be developed taking into account the territoriality of involved variables.

The axis of knowledge arises, therefore, two purposes: to define, on the one hand, the method of implementing the activities of study, scientific research and analysis aimed at better identification and recognition of the cultural heritage of the UNESCO heritage site and build on the other hand, a dynamic geo-referenced information system for the collection and ongoing monitoring of the status of resources, of the programs and projects for the protection and conservation.

In this methodological framework, an integrated approach to cultural heritage over to include in term (and related legislation) cultural assets kept separate until now, can not take into account analyzes, the criticism, the different interpretations of the concept of territory that in recent decades, it has undergone a radical transformation, especially regarding the different views on the relatedness of the territory, the dynamics between local and global, between the observer and the observed object. The Management Plan therefore can represent the information base system on which to build and represent not only geographically, but also functionally, the identified management strategy. Furthermore, it is the information matrix (SIT) for the following implementations and upgrades related to the state of preservation and appreciation of resources.

4. Considerations and concluding remarks

The outlined method of investigation in this article has led to a systematic collection of information regarding the definition of the Management Plans of UNESCO World Heritage Sites, illustrated as a means of address for the enhancement and control of land and cultural heritage. Furthermore it is highlighted, through the use of GIS, that the implementation of activities organically inserted between the strategies of the Management Plans can play an effective role in the strengthening of local identity and especially in safeguarding the authenticity and integrity of those universal values thanks to which it can be defined a World Heritage site. In conclusion, the proposal to assemble and integrate the GIS technology with the management of UNESCO World Heritage Sites, is evaluated as a necessary model to build a unified framework of updated knowledge in which effectively manage resources through the various data.

E-mail alessandro.ciambrone@unina2.it

Abstract

This paper examines strategies to combine economic development needs related to cultural tourism with actions for the protection and enhancement of heritage in a sustainable way. France, first Country in the world for number of international visitors, according to updated data provided by the World Tourism Organizations, has developed a long-term government policy aimed at the protection and enhancement of heritage. Moreover, this Country promoted all forms of art and intellectual production. The culture in France, over the centuries, affirms itself in the policies adopted, as the most important tool for achieving a comprehensive development, including social and economic, which ensures the quality of life of every individual. In particular, this paper analyzes system of site's management, which focus on promotion of culture. The sites are: the Agglomeration of Montpellier, for planning and management at the metropolitan scale; Loire Valley, for the identity of the place linked to the territorial promotion; Saint Guillelm le Desert et la Communauté de commune Vallée de l'Hérault for the aspects related to authenticity, integrity and sustainable tourism; Pont du Gard, for the new models of management, economic and sustainable development; Bibracte for the enhancement of culture and scientific research; and the project for the Seine in Paris, for the transparency and public participation in the planning process.

Keyword: cultural tourism, integrated management.

The Role of Culture in France.

France, first country in the world by number of international visitors [1], developed a long-term government policy aimed at the protection and enhancement of heritage, through interventions on the assets, on the organizational structure of the institution responsible as well as on the promotion of all art forms of intellectual production. The critical analysis of case studies in France refers to emblematic sites of the French heritage included in World Heritage list and in the prestigious Réseau des Grands Sites de France. These examples have been universally recognized, by the French State and the relevant scientific literature, as models of sustainable management, able to mediate the needs of conservation and the economic development linked to tourism. The sites are: Montpellier; the Loire Valley; Saint-Guilhem-le-Désert et Gorges de l'Hérault; Pont du Gard; Bibracte; the Seine in Paris. The predominant role of culture in France is marked by a policy of national government, through a structured and organized administration and financial system of, which manifested itself in the past, for example, through the support of foreign artists living in France. Among the most famous links in the relationship between artists and representatives of political power or patrons, is recalled that between Leonardo da Vinci and Francis I, who honored him with the title of premier peintre, architecte, et

mécanicien du roi [2]. The culture in France, over the centuries, affirms itself in the policies adopted, as the most important tool for achieving a comprehensive development, including social and economic, which ensures the quality of life of every individual [3]. It is a State's duty for all to be able to access culture, as provided by the French Constitution. This is also the main objective of the Ministry of Culture, which foresees: making accessible to the widest possible public the works of art, primarily national ones; to encourage the creation of works of art and stimulate the spirit that enriches them (décret n. 59-889 du 24 juillet 1959), [4]. Indeed, creation is a cornerstone of French cultural policy that is expressed through two main actions. The first appears to support the artists in their training, assuring a system of support in the absence of work, protecting intellectual property and facilitating access to internal and external market. The second is materialized with the support of business through numerous public commissions, specific tax and financial measures and the creation of specific places for exhibitions and events [5]. The main role of the State is recorded in the investment for culture with funding in this economic sector: with a budget of 2.816 billion euro announced in the national budget for culture in 2009 - and an increase of 2.4 per cent more compared to 2008 - investments in culture have increased almost continuously over the last twenty five years [6]. France, with eighty-two million international arrivals, is the most visited country in the world. The concentration of natural and cultural heritage is very strong in the Country, forming the basis for a tourist economy, which represents 6.2 percent of Gross Domestic Product (GDP) [7]. The added value of tourism in France, as a percentage of GDP, is higher than that of other sectors which contribute decisively to the national economy. The total tourist income in the country in 2009 is 84.7 billion euro. Of these, the value added of 41.6 billion euro, exceeding the energy and agriculture (30 billion respectively), agro-food industry (25.7 billion) and automotive (11.2 billion) . By its nature, as a sector of services, tourism is a major generator of employment, with an average annual growth of twenty-seven thousand employees over the past ten years [8]. The field of cultural tourism has opened new perspectives to respond to market needs. The visit to the most emblematic and visited historic sites in France, no longer meets sufficiently and exclusively tourists, who ask and seek monuments and sites that are expression even of a minor heritage. Moreover, they ask for high profile cultural events. To meet these growing demands, the Convention "Culture tourisme" between the Ministry of Culture and the State Secretariat for Tourism was signed in November 2009. The Convention's main objective is to encourage innovation and practices of tourism development focused on monumental heritage, in order to differentiate the tourist routes and avoid massive flow of visitors that focus exclusively on a few properties, thanks to the organization of large events in other less promoted places. This is in view of the fact that "the greatest problem of tourism in France comes from the over-attendance of a dozen of well-known sites. Seven national monuments, in fact, achieve the 2/3 of attendance at such sites, and three museums accounting for sixty percent of visitors to the national museum system." [9] In fact, these initiatives are consistent with a cultural policy already initiated since years that allowed to the creation of many annual festivals and events, not only in France, but throughout Europe. To name a few, include: the music festival which is celebrated since 1982, every June 21st in all French cities; the European Heritage Days, which since 1991, is held in the third week of September; the night of the museums, which is held annually since May of 2005; and the film festival which is held for three days in late June. Between tourism and enhancement of heritage, while respecting the principles of sustainable development, the decentralization processes of territorial management has played a key role in France, in line with the requirements of the international conventions on protection of cultural and landscape heritage. In 1982 it has created a special procedure for decentralization (Law Defferre 1982). As part of efforts to decentralize the management of the assets and to strengthen relations between State and local authorities, the law n. 6 of January 4th, 2002 introduces a new management structure: l'Établissement Public de Coopération Culturelle (EPCC). This is an institution for the management of a public cultural service, managed by a local institution, which can extend to several municipalities [Établissement public de coopération intercommunale (EPCI)]. This new tool allows to facilitate the participation of one or more local communities, also in economic terms, within a joint and shared project. The EPCC can assume different forms to support all the sectors of cultural activities. Among them, those in support of the activities of: heritage (museums, libraries-media libraries, historical monuments); the teaching of art (schools of music and art); the plastic art (art centers); and the organization of events.

Le Schéma de Cohérence Territoriale (SCoT) de Montpellier.

The idea of preserving and enhancing the rural landscape structures also le Schéma de Cohérence Territoriale (SCoT) of Montpellier, related to the agglomeration of the City, which includes thirty-one Municipalities and four hundred thousand inhabitants. The peculiarity of the SCoT is that its perimeter is perfectly coincident with that of the Communauté d'agglomération de Montpellier, established on August 1st, 2001. The elected drew, at the time, the lines for a common strategy for urban development of Montpellier and its agglomeration, in response to the constant population growth

during the last forty years. To a policy incapable of managing the land wisely, in the respect of protecting its natural and built heritage, it replaces, in the late seventies, a strategic vision that sees in the planning of the metropolitan city, an environment committed to the principles of development of a more equitable and sustainable collective life. It was affirmed, in these years, the ordering lines of a territorial and landscape planning at the metropolitan scale, which proposed the City as principal productive, cultural and scientific pole for the entire Languedoc-Roussillon Region [10]. The large urban project is based on a landscape master plan, which is developed on a axis that foresees the expansion of Montpellier to the coast, along the "sea route", named, in June 2009, avenue Raymond-Dugrand [11]. The urban design strategies, launched at the end of the seventies, had the goal of giving to Montpellier, in the regional context, the role of a functional, dynamic and safe city, with a high quality of life for its citizens, under the environmental, urban and economic profiles, even through appropriate social policies. The Schéma has reversed the logic that perceives the agricultural land and natural sites as a variable to be adapted to the needs of urban expansion, in favor of a vision that, in contrast, interprets these areas as an expression of identity of places and a catalyst for economic development. The urban expansion, scheduled according to the directional axis of the "sea route", projects the city on the coast, with ample space project dedicated to nature and agriculture [12]. Policies of spatial planning and asset management in Montpellier have developed, not surprisingly, in parallel to those for the promotion of culture, which has enabled the City to become a focal point of regional, national and international reference for the provision of services to the population and visitors. It is here that is born, thanks to the support of the Ministry of Culture, the Festival de Radio France et Montpellier and the Festival International Montpellier Danse, which have become two locomotives driving the spread of this kind of events in the Country. Moreover, it was realized, since the eighties, the national regional conservatory, the high school of fine arts and Corum, a cultural and leisure center capable of hosting major events. To confirm the importance of this sector and of the policies in favor of cultural promotion, we observe that with a budget of more than eighty million euro, the Communauté d'agglomération de Montpellier is one of the first urban areas in France for investing in culture [13].

Fig. 1: Montpellier, Antigone centre (photograph by Alessandro Ciambrone).

The Loire Valley.

The inscribed area of the Loire Valley extends over a length of 280 km and covers an area of about eight hundred square kilometers. The area includes two Regions, four Departments, six Conurbations, eleven Countries, 164 Municipalities, a regional natural park and it houses up to about 1.2 million

people. The site is one of the most visited in France. Both Regions in which is located the property (Centre et Pays de la Loire) received a greater number of tourists in comparison with the year of the inclusion of the site in the UNESCO list. Tourists in the Centre Region increased from seven to eight million, and those of the Pays de la Loire Region, from ten to thirteen million in the last ten years [14]. In 2002 it was signed by regional, departmental, municipal and consultative bodies of the territory a "charter of commitments" with the aim of increasing the attractiveness of the area in terms of landscape, environment, tourism and cultural services. The State and local authorities, at the request of the World Heritage Committee, established a system of management and the site consists of three bodies:

- la Conférence Territoriale, which indicates the guidelines;
- le Comité pour le Développement, which assumes a consultative role; and
- Mission Val de Loire, which is the operative body in charge of the management of the site.

This structure allows a simplification of complex bureaucratic procedures, precisely because each body has specific functions that do not overlap, but it integrates to that of others. Cooperation is not limited to the local or national sphere, but also extends to international cooperation projects. The Centre et Pays de la Loire Regions, with the Universities of the Loire Valley, founded in 2005, the Institut international fleuves et patrimoine that develops, in cooperation with the Mission, basic and applied researches, through comparative analysis and studies of best practices among the rivers Loire, Niger and Mekong.

Fig. 2: Lorey Valley, Chateau de Chenonceaux (photograph by Alessandro Ciambrone).

All the programs of management and promotion of the site are connected, through a concerted strategy, to the criteria that allowed the site its inclusion in the World Heritage List. It has also designed a special logo, showing the temple of UNESCO, the emblem of the Convention on the Protection of the World Cultural and Natural Heritage of 1972 and the words Val de Loire Patrimoine Mondial. The label, thus defined, is advertised on all brochures and catalogs of scientific, cultural and tourist promotion of the area. Additionally, in each of the 164 Municipalities included in the perimeter of the listed site, were positioned appropriate panels in the same format. These confirm that the property is included in the World Heritage sites list. All the strategies of promotion and education respond to the desire to strengthen the attachment of local communities and, in particular, the younger generation at the historical background of the territory. Education for protection favors the creation of a management class attentive to the protection and enhancement of the heritage, which is, among other things, promoted through a strong promotional message in the international tourism market. In fact, the use of

the UNESCO logo and of the World Heritage emblem are perceived by foreign visitors, as a mark of quality and integrity.

Saint Guillelm le Desert et la Communauté de commune Vallée de l'Hérault.

La Communauté de communes Vallée de l'Hérault in the Languedoc-Roussillon Region, is located in the heart of the Department de l'Hérault, near the Agglomeration of Montpellier. La Communauté consists of twenty-eight Municipalities. Its population of thirty-two thousand inhabitants, has grown rapidly in recent decades. The territory extends over four hundred square kilometers. This is characterized by a unique natural landscape, eroded by the river Hérault, including forests, vineyards, olive groves and scrubland. The area is also characterized by the ancient villages, and a strong sense of spirituality. In fact, these sites are included in the route of Saint Jacques de Compostella en France, which includes the Pont du Diable and the Abbaye de Gellone in the village of Saint Guillelm le Désert, inscribed, for this reason, in the World Heritage list. Five out of the twenty-eight Municipalities in the Vallée de l'Hérault in 2002, were awarded the Grand Site de France label, which is a prestigious recognition given by the State for a management that combines preservation of the landscape and the "spirit of the place, as well as quality in the visitors' welcoming and participation of local communities. It was estimated in 2006 that these Municipalities welcomed a number of unsustainable visitors - about seven hundred thousand a year - with peaks of thirteen thousand tourists per day during the high season. All this resulted in inevitable negative consequences for the preservation of monuments and landscape of the area.

Fig. 3: Pont du Diable (photograph by Alessandro Ciambrone).

To avoid these negative impacts and limit tourist arrivals, local authorities, since 1991, decided to join the Opération Grand Site, launched by the French government in the eighties. L'Opération provided innovative management actions for sites protected by the Ministry of ecology and sustainable development. The main objectives of this initiative were: the management of tourist flows; improving the publics' reception and the conservation and enhancement of cultural heritage and landscape. In this sense, it was realized a center of hospitality for the territory, which is located in Pont du Diable. Also, it was realized a parking lot, sized in reference to the need to welcome people, and perfectly integrated into the landscape, which allows visitors to leave the car without entering in the most visited localities of the territory, as it was happening in the years before the creation of the complex. In the Management Plan of the Grand Site, particular attention was paid to the enhancement of the rural landscape, the promotion of agricultural products and local handicrafts as an engine for the

sustainable development of the territory. In terms of tourism, a special partnership agreement was signed with the inter-Municipalities office of tourism promotion. This agreement has allowed the development of a unique and agreed promotion strategy with the concentration of funds devoted to publicizing the sites and to optimize the services for visitors. To verify the degree of satisfaction of the visitors in the logic of the guidelines of *Grand Site*, were designed and implemented a number of initiatives, including: the observatory for the tourist fluxes, the observatory on landscapes; investigations related to the economic impact on the area in connection with its frequentation by visitors; the observatory on the natural environment and the state of conservation of the site.

In the framework of the departmental forum for sustainable tourism, the impact on the local economy since the beginning of the operation Grand Site, were evaluated in approximately fifty million respect the initial investment of about fifteen million. In other words, the economic impact on the community was over three times the initial investment.

Pont du Gard.

Le Pont du Gard in the Languedoc-Roussillon Region, is one of the few sites in France which received both the UNESCO brand and the Grand Site label by the State (Ministry of ecology).

In 1985, after inclusion of the Pont du Gard in the UNESCO list, the Conseil général du Gard, expecting an increase in tourism, decided to implement actions in order to protect and manage the most visited cultural and tourist site of the Department. In fact, there was no welcoming structure, at the time.

Fig. 4: Pont du Gard, Reception centre (photograph by Alessandro Ciambrone).

"Savages" paths were born spontaneously eroding the natural spaces. Between 1996 and 2000, an area of one hundred sixty-five hectares around the monument was the object of a major environmental restoration. The proposal is designed to ensure a careful form of protection for the site and the best possible conditions of access to visitors.

The realized project configures a new vision of the space, which is returned completely to pedestrian and interdicted to vehicular traffic. The whole area around the Bridge, for a diameter of five hundred meters, was returned to its original state. In fact, the parking lots that allow pedestrian access to the site. The silent architectures, respecting the prerogatives of the landscape, fit into the environment with a very discreet impact in relation to the monument. On the left bank of the Gardon river, in the building of new construction, which contains space for reception, bookstore, cafeteria and restaurant, was made the largest virtual museum and interpretation center on the history of Romans in France. At its side is located a recreation center dedicated to preschools and educational activities. The complex

includes the space for temporary exhibitions and cinema, with three hundred seats, where throughout the year, events and projections about the history and traditions of the place are organized.

With regard to the policies of management of cultural heritage and landscape, the UNESCO site and Grand Site de France du Pont du Gard is managed since 2003 through an Etablissement Public de Coopération Culturelle (EPCC). The objective of the EPCC of Pont du Gard is to develop the promotion of national and international cultural activities, tourism and environmental policies. The project contributed, in a few years, to the definition of a "cultural district" and allowed a significant increase in economic revenues for the site and the whole Region. The number of visitors has increased by one hundred thousand units in three years, from 1.3 million in 2008 to 1.4 million in 2011. In the same period, the economic revenues increased of the eighty-seven percent and the self sustaining of the EPCC, compared to the allocation of public funds, is passed from fifty percent to seventy-three. Pont du Gard moves an economy on a large area that involves fifteen hundred people engaged in cultural activities and tourist facilities, and produces an induced income of one hundred forty million per year in the Languedoc-Roussillon Region [15]. Another factor that contributed greatly to the promotion of Pont du Gard is the rich program of national and international events, which makes the "cultural district" alive and accessible in all the seasons of the year. Throughout the summer the site is illuminated at night and thanks to the organization of concerts and shows of various kinds, it has become a magnet for the entire Department. The Bridge, with Avignon and Nîmes, represents a must for French and foreign visitors, and is often promoted to the international tourism fairs, through an integrated offering that includes the two nearby Cities.

Bibracte.

Located in the heart of Burgundy, on the Mont-Beauvray, in the Regional natural park of Morvan, Bibracte is the name of the ancient capital of the Aedui, a powerful Gallic tribe. The site was abandoned after the Roman conquest. Later, the area was not significantly occupied, and it is for this reason that Bibracte is today one of the best preserved fortified cities of the late Iron Age. It is also a site of great symbolic importance for the French national history. For its historical and landscape characteristics, as well as the concrete actions for the protection and enhancement of the site, Bibracte has also been awarded the Grand Site de France label in 2008. The fortune of Bibracte is due to the political choices of the president François Mitterrand, who proclaims in 1985 the oppidum "site of national significance", and in 1989 includes it in the ambitious program of the "Grands Travaux de l'État". The heart of the property's scientific activities is a program of archaeological researches on the Gallic city from which it takes its name. The project, started in 1984, involving approximately fifteen European Universities and Research Centers. The originality of the scientific and research program of the EPCC of Bibracte consists in the fact that it involves students and researchers from different centers of higher education, coordinated in their projects, by the permanent scientific team of the European archaeological center. Bibracte fully supports all the subsistence costs of students – who belongs at the scientific institutions partners - which are hosted free of charge. The European centre for archaeological research provides publication of the major scientific studies through a series called, precisely, Bibracte [16]. In the domain of research, Bibracte aims to consolidate its role as a European reference for studies related to the Celtic period and the emergence of urban civilization in Central Europe. In the field of training, the EPCC aims to become the place of excellence for continental practical education of archaeologists, because the site hosts the largest program of archaeological research on the field, organized in the last thirty years [17]. Also, Bibracte is a regional pole of cultural and tourist attraction. The EPCC invests half of its funds to promote awareness of archeology to the general public through the museum, the temporary thematic exhibitions and cultural events of a different nature.

Fig. 5: Bibracte (photograph by EPCC Bibracte).

The site receives between forty and forty-five thousand visitors a year, among them, eight thousand are young students. These data are stable since 1996, or since it was opened the archaeological museum. The EPCC is also a cultural point of reference for the Pôle National de ressources éducatives "Patrimoine archéologique", which was constituted in 2003 within the framework of the inter-ministerial program for arts, education and culture. Finally, a number of tours to the site are organized especially with the schools in the area. The identity of the Morvan, which is based on music, languages and customs, it is not lost, but on the contrary, has been restored and enhanced in recent decades. Paradoxically, the new residents from other Regions, including some countries of northern Europe, contributed to the rediscovery of the ancient traditions of the area. In this context, Bibracte represents a cultural center of primary importance for a local community which does not have many opportunities for recreation as well as social and intellectual exchanges. For this reason, the program of the museum is not only focused on archaeological exhibitions, but extends to various events that may attract both local residents and foreign visitors.

Paris.

The World Heritage Committee decided to include the property "Paris, banks of the Seine" in the UNESCO World Heritage list in 1991. The bridges, as well as the built heritage on the banks of the river, are linked to the growth of the City and are intended to establish, activate and multiply all kinds of relationships among residents and foreign visitors [18]. The contemporary City that has developed between the sixteenth (in particular the seventeenth century) and the twentieth century, expressed through different historical and architectural traces, the evolutions of the relations between the river and the citizens. The project of enhancement of the banks of the river launched, in April of 2010, by the City administration speaks of these relationships, and of the different spatial, functional and architectural configuration of the Seine in a process of urban transformation that involves Paris and its metropolitan area. The project goal is to reduce the vehicular space on the banks of the river - in the center of the City – in order to return a larger pedestrian area, and then allow the citizens and visitors easier access to the promenade along the Seine. Therefore more spaces will be dedicated to public life, leisure and culture. The project covers an area of fifteen hectares of which four will be completely returned to the exclusive use of pedestrian and bicycle paths. The estimated cost for the entire operation is forty million euro. On the left bank, the project includes the construction of natural itineraries, sport areas,

Fig. 6: Paris, Beaubourg (photograph by Alessandro Ciambrone).

outdoor spaces for exhibitions and events. On the right bank there will be a reduction of the roadway and the installation of traffic lights, to decrease the speed of vehicular traffic, and allow for easier pedestrian and cycle access to the Seine. To promote the enjoyment of the riverfront, the project planned five mooring stations, including one designed for the transportation of passengers on the boats, and four other floating platforms, for recreational, cultural and tourist activities. The mayor of the City sent all the project's documentation to the UNESCO World Heritage Centre. Moreover, le Conseil launched a public consultation, in accordance with the Code of urbanism, to involve concerned local communities, citizens and everyone who could be involved through comments, suggestions and concerns about the proposal [19]. The consultation has been characterized by the participation of a large number of public and private institutions, for the communities involved on a metropolitan scale, according to a tool that went beyond the usual forms of advertising, such as public meetings and exhibitions of the project. The rich program of cultural events and initiatives, in fact, increases that already full of entertainment of Paris on the international scenario. Thus, buildings, monuments, works of art, landscapes and gardens as well as programs of reach and international events are able, today, to identify a site as a privileged destination and cultural center of excellence. Probably, in an increasingly competitive tourism market, which looks for originality and spirit of places, the attention for historical and natural heritage, has the same importance than the interest related to the intangible assets. In this context, cultural policy, not improvised, which arises from the historical consolidated historical matrices, and reinterpreted in a contemporary way, seems to be able to create not only economic but also better conditions of life for the community of the territory.

Conclusion.

We consider that the critical study of best practices in France, may contribute to the definition of sustainable strategies in cultural tourism management to be adopted in other territorial contexts. The SCoT of Montpellier, is characterized by aspects of planning and management on a metropolitan scale, through a strategic vision, which is the result of thirty years of political continuity. Public participation, partnership, public-private consultation, and landscape planning are the main tools of a design that brought the City and its metropolitan area, to establish itself, over time, as one of the main centers of social, cultural and economic development in France. The cultural network of the Loire Valley can be considered a model, both for the management structure adopted – including three organizations (political, advisory and operational) that work synergistically with Universities and local communities for the territorial development - that for the processes of discovery of local identity and local promotion linked to the historical background and criteria that allowed the property its inclusion in the World Heritage list. Saint Guillelm le Désert et la Communauté de commune Vallée de l'Hérault is taken into account for the aspects related to the promotion of the authenticity and integrity of places, as well as for planning actions aimed at limiting the negative impacts of mass tourism, through the implementation of a project that, in contrast, favored the promotion of sustainable tourism. The EPPC du Pont du Gard was able to start a process of cultural and economic development, at regional and local level, through an architectural, environmental and landscaping redevelopment project of the site, as well as a careful system of management of the recreational and cultural activities, linked to the fruition of the cultural landscape, new reception and entertainment facilities. The EPCC of Bibracte stands for integrated management actions able, at the same time: to protect and enhance the archaeological site and the amazing landscape that surrounds it on an extension of nine hundred and fifty hectares; to realize an archaeological museum able to become a cultural center of attraction for the entire region; and to contribute to the definition of an international scientific community through the research program of the European archaeological centre, which is located in the site. The project for the enhancement of the banks of the Seine in Paris, is characterized, then, for the transparency with which the proposal was presented to local communities, and the public participation involving all the concerned stakeholders of the territory. It was so defined a collective project, coordinated and concerted, which become a model of democratic participation, not only in France, but throughout the world. All the best practices considered show some common characteristics. These are consistent with national policies for the promotion of culture and tourism, as well as examples of integrated management [20], where issues of protection, enhancement and sustainable development of tangible and intangible assets, are part of a single process. In particular, we emphasize the particular attention given to cultural events, not only traditional, but in all their expressions. Also, what we have seen in these best practices is that in the current era characterized by the economy of knowledge, the cultural identity of places has a greater value than that related to the tourism industry, because this is an indispensable asset in the educational process to maximize human capital and to make competitive and attractive the territory [21].

"Santa Sapienza allo studio" Chapel in Rome : a representation of its domed ceiling. Borromini master of "Trompe-l'œil".

Antonio MOLLICONE

Department of Architecture and Urban Design, Faculty for the Built Environment, University of Malta, Msida, Malta
antonio.mollicone@um.edu.mt

Abstract (ID n° 006)

The most obvious and recognised theory on the composition origin of the cornice (moulding) of the entablature is the geometrical one of superimposed triangles forming the six-pointed star. Symbolically the plant of S.Ivo is identical, perhaps by pure coincidence, to the profile of the four "tiles"(formelle) with allegoric figures of the Cardinal Virtues on the façade of the Loggia della Signoria (1386) with the starred background and the figures with wings. "Prudence" is said "*auriga virtutem*" (it leads the other virtues) and in Platonic philosophy is synonymous to "Wisdom" (Sapienza), the Virtue of the rational Soul. The important set-up of said moulding, if on one hand reveals the footprint of the chapel, on the other hand distracts the observer from the complexity of the surfaces that, generated from it, come together in the target circumference of the oculus. From the simple to complex shapes, from the *Analytical Surfaces (Primitive)* to the *Free Form* ones up to the *Global Shape Modelling* : a precursor of the art of joining between surfaces, nowadays accomplished with CAD systems modelling strategies (*interpolation, associativity*). The decorations are not casual but thought and placed to hide the discontinuities between surfaces in order to enhance the effects of parallelism and symmetry. Borromini wins the "challenge" building a wall structure subject to the laws of statics forcing the surfaces' generating geometric entities to *coincide* with the ones used for the solution of the statics and/or construction problems.

Keywords: Sant'Ivo ; Borromini ; Rappresentazione ; Trompe-l'œil.

1. Scope and Methodology.

The computer and graphic models both illustrate, the reality in itself, the object.

Based on the direct and/or indirect survey, analogue or digital, are useful for the objective of

.... "*de représenter avec exactitude,...*".(Fig.1,2)

The mathematical models can, thanks to software, completely illustrate distant objects with infinite ever more realistic views, furthermore the traditional graphical model can, automatically, be obtained on various layers.

Digital technology solves the problems related to representation, divulgation, to classification ... from photo-reality to "*augmented reality*", a fascinating tool.

However in order to understand and not "forget" (study), the practice of *real life drawing* is fundamental.

To observe (not only look at), *build* the apparent contours of distant shapes, through intuitive sections of the same, reduces the problem of the impossibility of direct measurement.

The model of the cloud of points replaces the object to survey that can be "imagined" in our hands.

It can be rotated, measured, split and dismembered ...

The different components, isolated, can be projected in any direction for a classical representation in true form of the directing and generating curves.

In representing the apparent contours of this ceiling, the use of details, both architectural and decorative, by Borromini for reasons of perspective, is appreciated.

Fig. 1: Computer model.

Fig. 2: Graphical model.

2. Geometry of the arris line.

Formed by the adjacent fasciae, “disappears” when said fasciae overlap.

Comparable to a circular arch, whose chord is the side of an isosceles triangle with a vertex in the centre of the arch, the other in the impost of the same arch and the last at the top of the arris.

Even the median sections of the surfaces can be likened to circular arches whose centre has an altitude greater of the impost plane like the curves of the arris for which the observer will see them from the relative horizontal quadrant upwards even when, close to the sides of the hall, the frame of the attic hides the part of the arcs under the point of quadrant: this perspective detail makes the vault seem lighter since said curves (arches) are seen in their ascending parts. (Figg.3, 4)

Fig. 3: Chord of the arris .

Fig. 4: Geometry of the arris.

3. (Circular) Crown.

The circular moulding (crown) that unites at the top the lesenes making up the ribs has a “wavy” pattern because said lesenes lying on different surfaces intersect with it (crown) at symmetric curves (joint), with respect to the arris lines, only in projection (or view from underneath).

This deformation, appreciable only in the classical representation, is one of the “deceptions” intended by Borromini, conscious of the fact that from the position of the observer the joining moulding (crown) would have been perceived as a horizontal band. (Fig.5)

Fig. 5: Elevation view of the joining moulding (crown) of the lesenes of the ribs.

4. Convex/concave surface: angle frame.

The horizontal band of the angle frame, having to lean both on the (still) central convex surface and on the adjacent surfaces (cylindrical), will have a configuration illustrated in the model of Fig. 6.

The lower wings of the cherub, overlapping to the upper edge of the horizontal band, “deceive” the eye making it seem concentric to the circular aperture of the oculus.

On top of the frame the convex surface must morph to concave to join with both the circular crown and the cylindrical lateral surfaces.

This transition is resolved masterfully with a high relief modelling of the cherub with three pairs of wings leaning forward. (Fig. 7)

Fig. 6: Horizontal band (angle frame) .

Fig. 7: Cherub (angle frame) .

5. Generating sections, guide curves (concave surface).

The representation of the apparent contours of the mouldings, through the projection of the sections, must take into account the differences of the surfaces on which they lay.

The silhouettes have been made to slide along the guide curves varying the inclination, the measure and/or opening with respect to the guides to obtain the effect of a constant section. (Figg.8, 9)

Fig. 8: Moulded band.

Fig. 9: Projection of apsidal frame.

6. Geometry of surfaces.

The great challenge to join/transform a mixed-linear profile in a circumference building a wall structure subject to the laws of static has been majestically “won” imposing on the genesis geometrical elements of the architectural form to “coincide” with the ones used for the solution of static and/or construction problems.

The geometrical element that solves the problem is the circle in the vertical plane.

Sectioning with vertical planes (on the upper part) the cloud of points relative to the apsidal concave surface, circles can be obtained tangent to the lesenes of the ribs and others circles, with other sectioning vertical planes, can be obtained and be considered (central) part of poly-circular curves also tangent to the lesenes.

These circular and poly-circular sections, together with the edges of the lesenes of the ribs and to the “goose neck” arch (symmetry section), define the edges of sections of the concave surface.

Same considerations for the convex-concave surface.

Given the mixed-linear configuration of the impost, the latter surface exhibits lines of discontinuity created by the sheets of linear generation and by those of curvilinear generation.

This “negative” arris ends when the surface, to join to the edge of the circular crown, is generated by circular arches with radii of increasing dimension.

The choice of the poly-centric (“goose neck” arch) as median section of the concave surface (apsidal niche), different to the arch circumference one of the convex-concave surface, is due to two factors: the greater distance, in projection, between the lower starting point from the ending one in the circular crown suggests a section curve statically correct; the possibility to insert discharging arches lowered in the least possible way. (Fig. 10)

Fig. 10: Vertical sections of the surfaces.

7. The function of decorations.

To hide (trompe-l'œil) the diversity of the two surfaces, in particular for the excessive concavity, at the extreme top, of the concave surface for the “goose neck” arch adopted as section, Borromini, master of solid perspective, places an unlikely angel with six wings which are furthermore crossed. It does not matter if they are at different altitudes, as the horizontal fascia of the frames, because, since they are figures on parallel planes and equidistant from the centre, when seen from the bottom, do not show their different altitude. (Fig. 11)

Fig. 11: Section of the upper part of the vault.

Eventual difficulties in accomplishing the continuity of the surfaces are overcome by the overlaying of majestic decorations with a heraldry theme. Even the position of the stars, with the horizontal arms aligned with the generating curve that defines the surfaces close to the lesenes of the ribs, adds lightness to the dome. (Fig. 12)

Fig. 12: Orthogonal projection of the vault.

8. Structural scheme (hypothesis): resisting arches and archivolts.

Having absorbed the generating curves and the guide curves of circular arches, belonging to vertical planes, the main structure of the centring can be hypothesised. (Fig. 13)

"The documents report that this vault, *"of extraordinary manufacturing, with a great number of distinct curves, that requires an expensive centring of a rather unusual kind"*, had to be disassembled and reconstructed many times to please the Architect". -J.Connors-(Burlington Magazine).

The median section of the entire dome shows at keystone level a horizontal surface with a width of around eight metres.

On this surface rests the walls of the lantern.

The geometry of the sails enables, in the horizontal area, to insert lowered discharging arches that load the main ribs.

The former will be tangent (plan alignment) to the sectors of the jack arch of the oculus hooked to the heads of the main ribs and at the same time contrasted at keystone level and hooked to the median resisting arches. (Fig. 14)

The next discharging arches go from segmental to a circular and finally poly-centric.

Fig. 13: Guide curves – main structure of the centring.

Fig. 14: Discharging arches system.

9. Observations.

When the dome is first constructed (1648) Guarinin is no longer in Rome but has spent time with Borromini and has probably seen (spied) the models of S.Ivo.

In the San Lorenzo (1668-87) the discharging arches are merged with the ribs reducing the masonry work of the dome. (Fig. 15)

This simplification (rightly of the mind of a mathematician) shows the interdependence between geometry and statics which is at the origin of the design process.

The "forces" that in the dome of San Lorenzo are perceived as sliding up to the impost plane, in the Mosque in Rome of Portoghesi are "seen" discharging to the ground the weight of a dome defined only by structural curves. (Fig. 15)

Fig. 15: San Lorenzo. (mobypicture.com)

Fig. 16: Mosque in Rome. (<http://blog.archpaper.com/wordpress/archives/15547>)

At the extreme top, various meanings are given to the surprising lantern (small temple with spiral dome). (Figg. 17-18)

The choice of a coherent theme to the entire composition but with an important mass, in my opinion, is due to the requirement to assure as much as possible the structural connection between ribs and discharging arches.

The choice of radial plan enables to distance from the centre the point of support of the structure. "However as soon as the construction of the lantern ends the dome is affected and remedial interventions are executed".

Connors states that had Borromini been aware of the excessive weight of the structure, he would have included as a precaution the chain in the wall of the drum (tiburio).

Survey of the architectural and historical characters of the Pavone "ricetto" for the retrieval of its own environmental identity

Pia DAVICO,

Dipartimento Architettura e Design, Politecnico di Torino, Torino, Italia
pia.davico@polito.it

Abstract

Near the "Serra d'Ivrea", in a landscape that preserves valuable natural views, rises the village of Pavone Canavese, characterized by the skyline of the old castle (known for Alfredo D'Andrade's works). Its volume stands out on a hilltop, surrounded by the ancient medieval village of the *ricetto*, consisting of small houses along an annular path: this leads to a charming environment where you can still get a breath of the atmosphere of past centuries. Largely constituted by the original stone cells, the *ricetto* has conserved the salient features that bring back to its origins, in spite of some delimited specific interventions that in the course of time have partially changed its physiognomy. This small building block, only apparently overwhelmed by the massive volume of the castle, has recently become a place of great attraction for the village and its territory: in fact in it we find physical and cultural characteristics that enhance the environmental identity, related to its own history in which the community has regained its identity autonomy.

The research on these characters, related to the single constructions, but also to those cultural factors that emerge from the environment, was the target of a methodological survey made with my students in a laboratory of restoration and urban survey. This work identified the typical components in order to supply the community with a regeneration and reutilization project (at different scales), aimed at increasing the value of an asset today still partially unknown.

Keywords: survey, ricetto, Pavone

1. Pavone Canavese and its territory

Pavone is a small village in the countryside of the Canavese, inserted in a charming flat landscape, surrounded by hills and mountains of the so-called "morainic amphitheatre of Ivrea." This natural environment is characterized in particular by the homonymous Serra's linear promontory, which creates a beautiful scenic background both for the design of the geometrical brindle of the vineyards and farmland, and for the crown of meadows and woods, which are typical of Ivrea's river basin.

The connections between Pavone and the surrounding area can be identified not only in the morphological feature of the place and in the environmental appearance. Today, more than in the past, this relationship is enhanced by cultural values, and especially by a historical awareness particularly analysed in the last decades by the local community, who has acquired the ensemble of the village and of the country like his own heritage.

2. The castle: a monument with many stories

For a long time, and until recently, Pavone acquired its identity through the impressive presence of the castle, an emerging volume compared to the built environment, both for the large size, and for the refined architectural feature.

The ancient castle of Ivrea's bishops has polarized upon itself for decades the touristic attentions of the area because in the collective imagination it perfectly correspond to the idea of "Castle". It is a complex building, with a rich and rather articulated history. Its present appearance is in fact the interesting result of Alfredo D'Andrade's restoration works which, between the nineteenth and

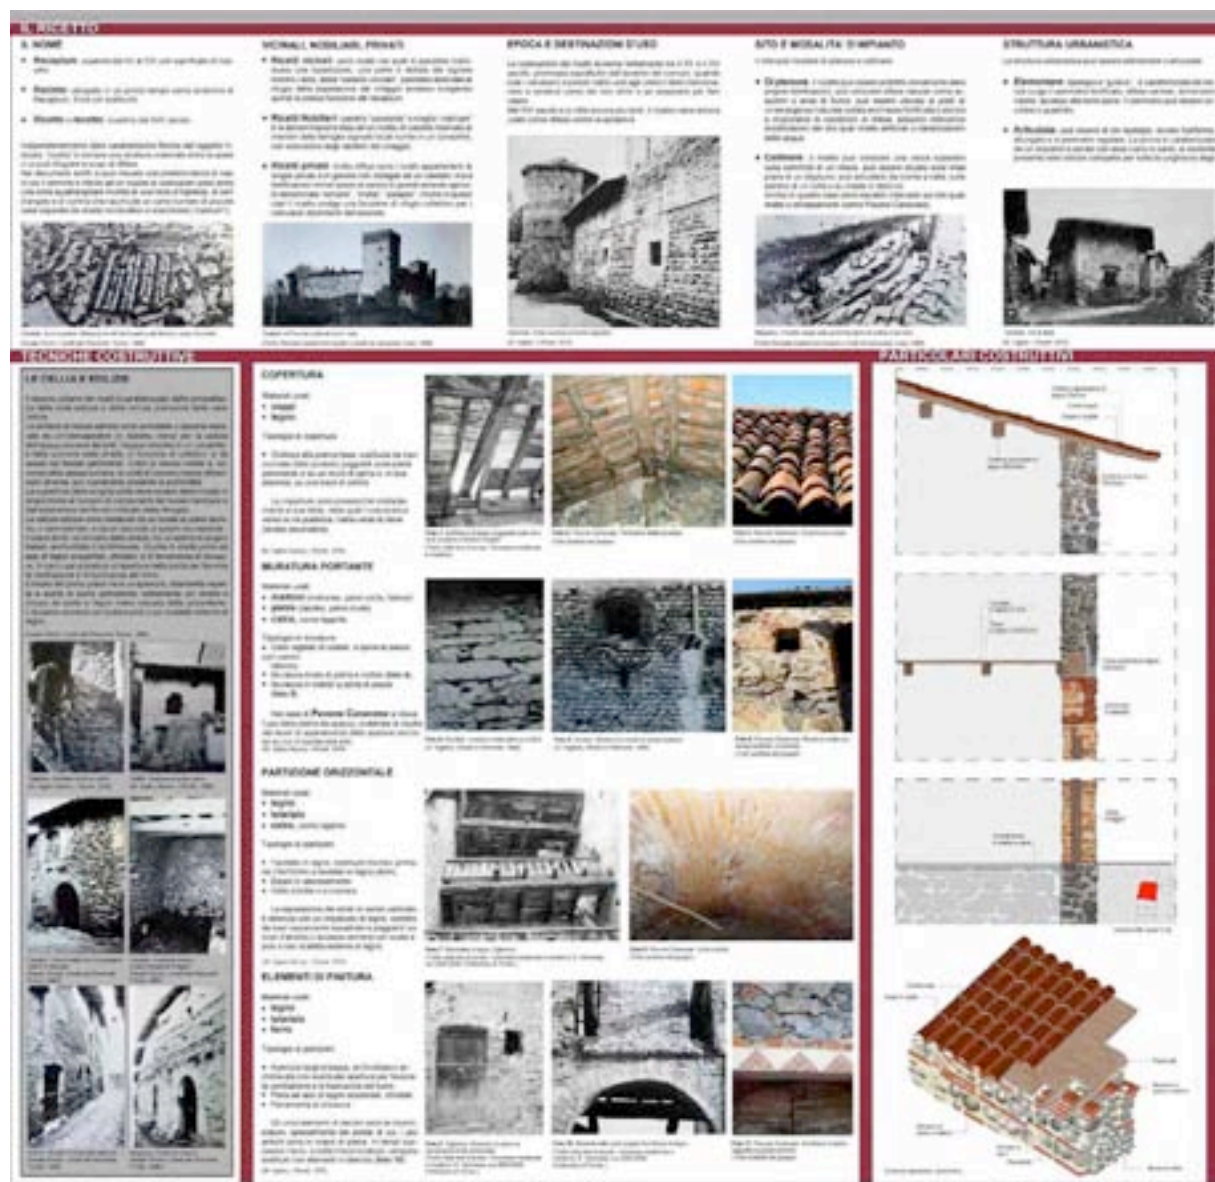

Fig. 1: Summary about the origins of the *ricetti* in Piemonte, their presence on the territory in the Middle Ages, and the current testimony of some of the best-preserved clusters like the one of Pavone (for example Candelo), and analysis of materials and constructive characters of the building cells.

twentieth century, permitted to enhance the image of the ancient castle, which had been lost in the course of time. Nevertheless his intervention is very disputed, because it is considered by many scholars too invasive, having integrated and modified the aspect of many parts of the building. Despite this, thanks to its restoration work, the castle (which was also for many years D'Andrade himself's home) is today a very interesting building, not only for the valuable appearance, but also as an example of a restoration approach today outdated, but significant as a cue for reflection upon the historical basics of the discipline and its evolution. [1]

The castle has played and still plays an attractive role for Pavone, directing the touristic attention for its impressive architecture and the services it hosts: a hotel, a restaurant and a luxurious conference centre.

In recent years, however, Pavone has become a place of tourist and cultural attraction also for other reasons, having increased the number of attractions offered centred on new elements of cultural, historical and environmental identification. Thanks to the local authorities and the cultural institutions, in accordance with its inhabitants, the important role of material and immaterial elements for a long time considered "minor" was revalued, even like a sort of enrichment for the tourist industry. In fact the Municipality has internalized the cultural trends developed in the last decades, researching and enhancing the local peculiarity of the history and traditions of its territory, which had been lost in the course of time. In particular, the Municipality and various associations in the area are working to master and support the peculiarity of the surrounding area: starting from the morphological and

landscape features, to the architectural ones, getting through to farming and craftsmanship production, in other words to all those aspects of the tradition whose memory was disappearing. [2]

3. The *ricetto*: a little cluster of great historical value

Among all of the local peculiarities, a leading role was recognised to the *ricetto*, a cluster of dwellings of medieval origin (at the feet of the castle), whose value has been underestimated for a long time. The interesting aggregate of small houses - that extends along two narrow parallel streets - preserved largely its ancient formal connotation, constituted by small size housing units built with stone. Although subjected to modification works of some cells, it maintained the environmental characters that make it a place where you can still "breathe the air" of the medieval period. It is not by chance that in the past twenty years, it is the venue for the folkloristic event *Ferie medievali*, with the revival of battles, works and customs.

Like Piemonte's other *ricetti*, the one of Pavone was formed in the period between the twelfth and fifteenth century, as a protected settlement for the rural population. In particular, the one of Pavone was born at first as a shelter with *cellaria* for the *homines* in a defended sector annexed to the seat of the lord in the site of the present castle; on the contrary a structure independent from the *castrum* is attested by the statutes in 1326, with obligations for men to guard the *ricetto* and the castle. [3, 4]

Its value, like that of Piemonte's other *ricetti*, lies not so much in the single building cells of very simple manufacturing, but rather in the urban structure of the cluster, as an attestation of a common settlement phenomenon in Piemonte's medieval history. The houses, one or two floors above ground, are mostly built with stone, with regular ashlar of large size for the edge elements (of the building or of the rare openings), and with river stones for the walls, often built with a regular mesh, sometimes having a "herringbone pattern". The shingles are almost always double pitch roof, with wooden structure and brick coats that have replaced the old stone roof (Fig. 1).

In the second half of last century, the insufficient perception of its historical value had reduced the cluster of housing in a state of semi-abandonment, being no longer considered appropriate for the new housing needs of the local population. This situation had led to neglect even some of the most attractive original buildings, or to the replacement of some cells or parts of them, condemned because of their state of abandonment. In spite of the degradation and transformations, as already mentioned, even so the *ricetto* preserved its overall environmental characterization. In fact until today it has maintained evident medieval characters, not only through the presence of many original buildings, but fundamentally by maintaining the aggregative structure and the dimensional characters typical of the old village. Despite the presence of some buildings of recent times (not so coherent with the typical typological characters of the core built, the architectural forms and the materials), thanks to the restoration and reconstruction works, the recuperation of the overall image and of many cells of *ricetto* has been realized, mostly in recent years.

In consequence of these interventions of valorisation, nowadays Pavone *ricetto* has become a place, as well as of great historical interest, of strong touristic and cultural attraction.

4. The methodological approach of the project of survey

A fascinating and stimulating environment like the one of Pavone has been the subject of the research of the interdisciplinary laboratory of survey and restoration that here is partially introduced, work proposed last year to the students of the "Corso di Laurea Magistrale in Sostenibilità" of the Politecnico di Torino. The survey was finalized to a restoration project of the *ricetto* (almost in its entirety) and of Pavone's other places of attraction, with the intent to pursue the Municipality's objective, not to limit the cultural interest only to the castle and to the *ricetto*, but to extend it to other items widespread on its territory.

So the survey work was organized like an analysis plan at more levels of knowledge, in order to identify and understand the characteristics not only of the constructed and of the natural environment, but also of the typical cultural matters of the territory, selecting the peculiarities and the possible connections which can exist or can be proposed for the future to the community. This approach has been chosen in order to direct the knowledge beyond the pure physicality of the built, as only understanding its history and the relationships with the context at more levels, those sometimes immaterial aspects that make it "a value" for the community can be understood. A value to grasp today, but to consider also in a future perspective: a great incentive for an activity finalized to a restoration work and an environmental recovery also on a large scale.

In the Atelier, therefore, the survey and the restore were grounded on the simulation of a real approach, like a complete and indispensable formative moment for the preparation of future architects, and also like a useful occasion to suggest to a Community which has freshly disclosed the less obvious values of its cultural heritage.

Every study case was approached planning each time a methodological organization of the survey suitable to put in evidence the historical, cultural, and functional peculiarities of every building, and to find an answer to them in its own architectonic forms and of the environment with which it interacts.

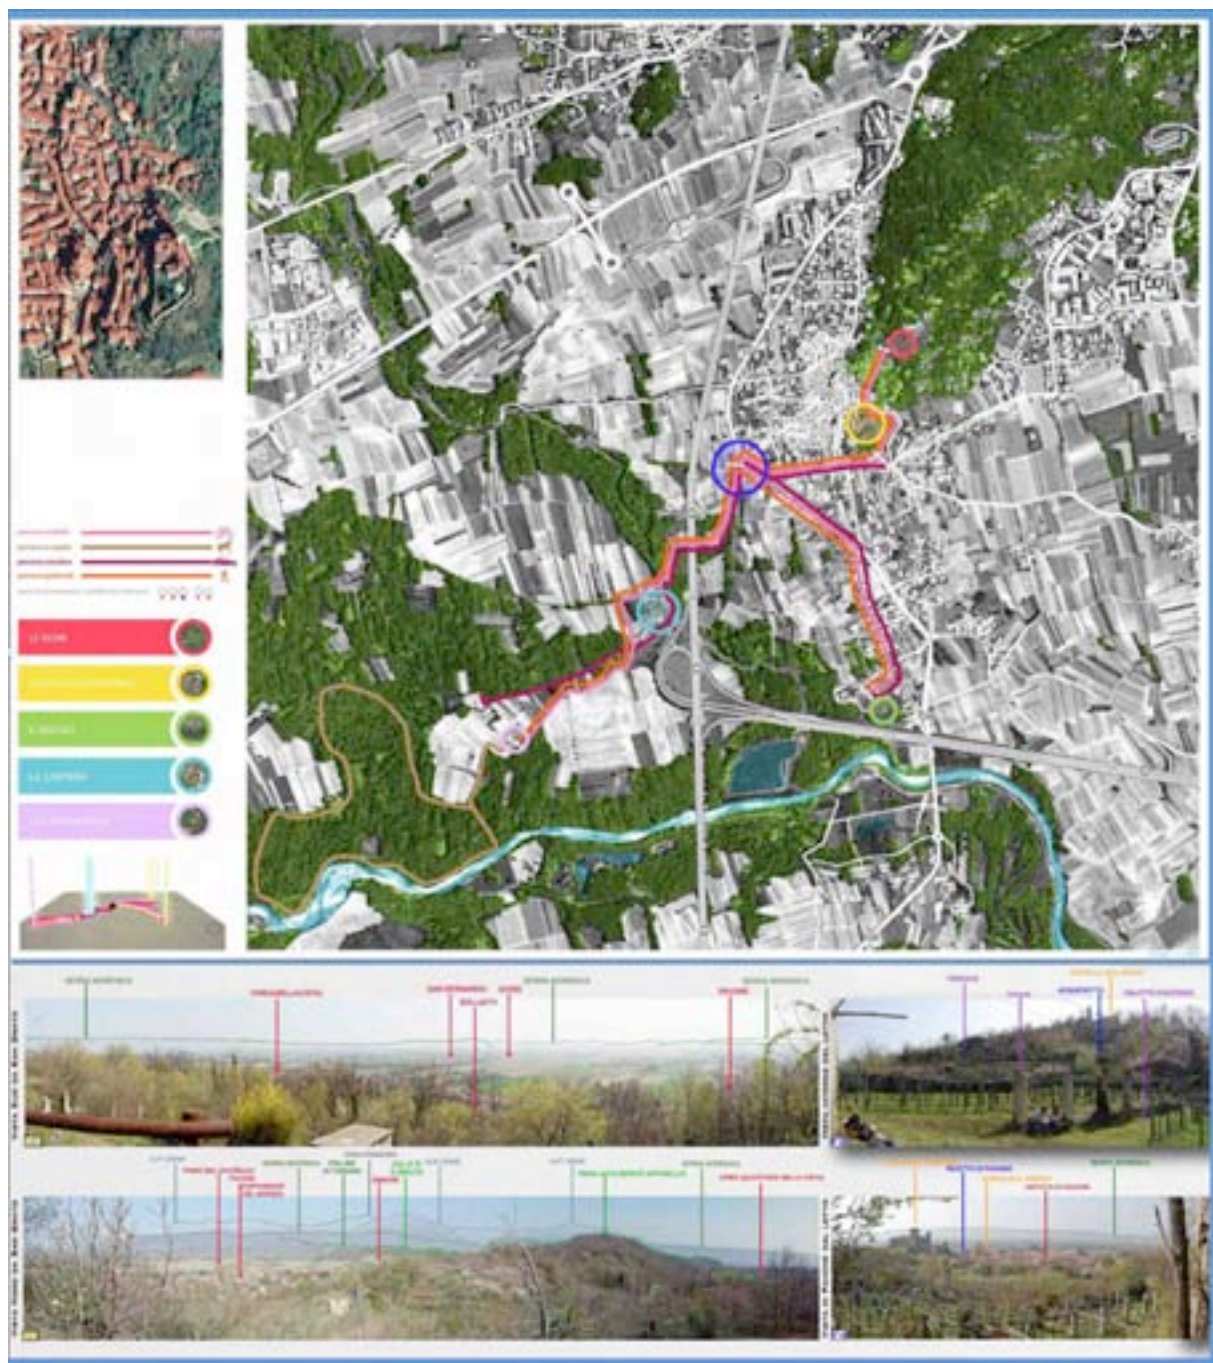

Fig. 2: The relationship between the built and the landscape is one of the important concepts to understand Pavone's territory and its culture. The natural environment is characterized by the linear promontory of the Serra di Ivrea, by the design of the geometrical brindle of vineyards, woods and farmlands, which link the places and buildings to the collective memory.

This approach guided every phase of the survey to identify the most suitable procedure in order to know each situation at more levels of analysis, and also to test the existence of complementariness between the obtained results, in a continuous interchange of information. Every method, from the most traditional to the one of the laser scanner, gave the possibility to understand the importance of any surveyed part. Each procedure has been chosen and adapted also in relation to the situation faced, that often opposed physical obstacles which did not allow to use the most advantageous method: seemingly trivial cases, like the inaccessibility of the rooms, either because condemned, or because of the absence of an owner who takes care of them, or because many buildings are often used as storehouses.

The *ricetto* itself is anyway difficult to survey, because it is placed on the small promontory at the feet of the castle, laid down on slopes with also severe altitude gaps, and the facades of the buildings extend along two very narrow streets in a tortuous way, along an uninterrupted but far from linear course. The survey is complicated still further, because many buildings are often made with ancient

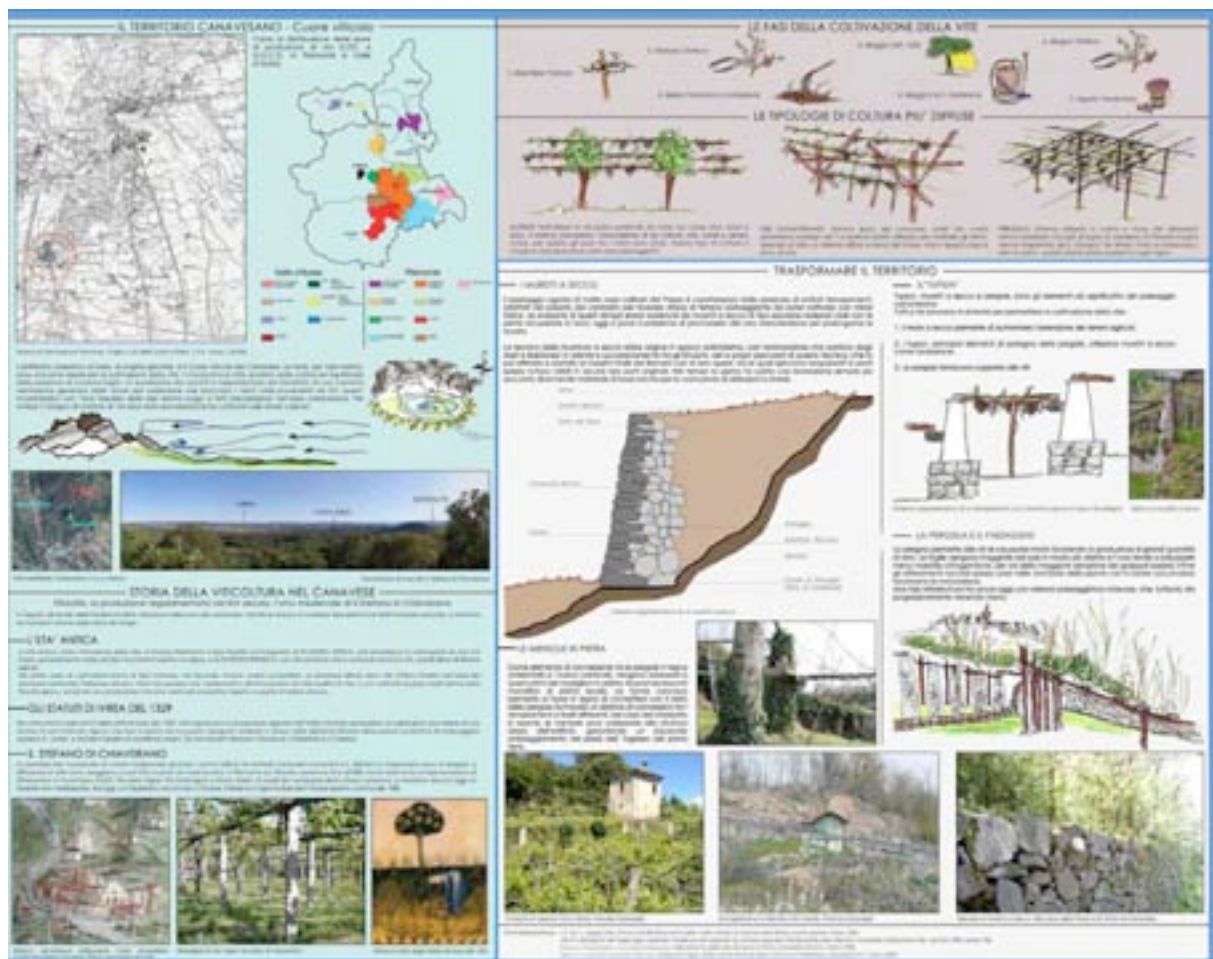

Fig. 3: Among the local traditions of the use of the land there is certainly viticulture, which has characterized the country in the past centuries, and today remains to characterize the environment surrounding the village: the vineyards draw the landscape, with the trellises and the dry stone walls (the *tupùn*), and the *ciabòt*.

handmade walls, of stone or mixed materials, revealing not plumb. Sometimes, to get the situation worse, they manifest also important patchings executed with not much care, that create variations to the already precarious linearity of the plan of the front facade.

In the other cases, concerning buildings and locations outside the central body, the methodological approach of the survey has been similar, though having observed sometimes different problems, such as the presence of natural barriers that obstructed the sight of some parts of the built, or the contact with the same one, not allowing the metric survey.

5. The survey of the characterizing elements of the heritage of Pavone territory

From the analysis and the study of the typical aspects of the area surrounding the village, physically interesting places and routes have been identified, to be recommended like itinerary stages aimed at the discovery of the morphological and historical features, and of the local culture. The methods of the survey have been finalized for each case study, to search the relationships between today's area and the features of its traditional culture and, if not existent, they were created in the project phase, in response to this necessity (Fig. 2). From the various researches a still evident relationship emerged between the built and the natural environment, revealed by the presence in the area of buildings (sometimes abandoned or in a state of semi-abandonment) belonging to the culture of the past ages. The mills prove to be significant, connected to the manufacturing of hemp and paper, or the *ciabòt*, tiny constructions of temporary refuge existing in the vast vineyards that surround the village, interesting examples of a past use of the territory and of the handcraft works that have been lost over time (Fig. 3).

Directing the attention to the most compact and dense situation of buildings, like the one of the *ricetto*, the survey intended to understand the most significant aspects that interact with the definition of environmental quality (Fig. 4). For example different elements were analysed: the planivolumetric conformation of the dwellings, the use of each floor in any cell, the characterization of the free areas surrounding the built such as the roads, measuring the often important different slopes, and the

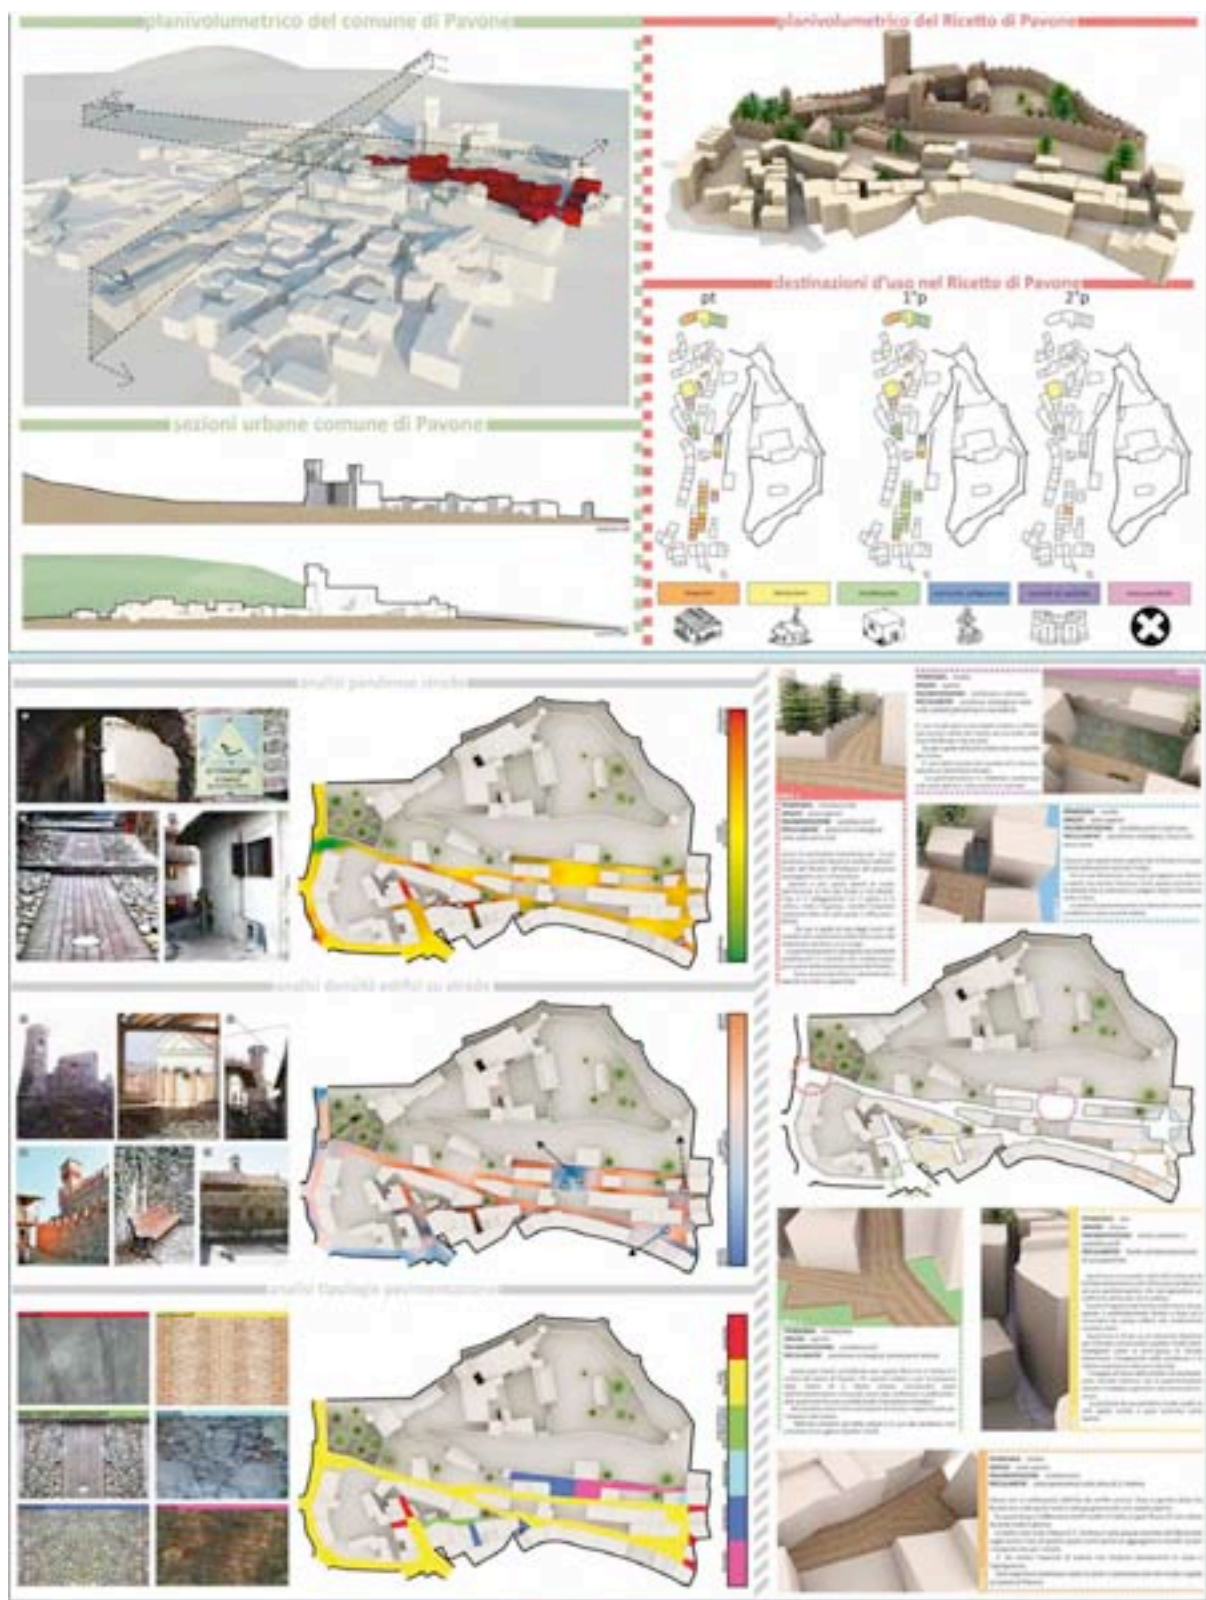

Fig. 4: Study of the ricetto's cluster of Pavone, highlighting: the planivolumetric conformation, the use of each floor of the cells, the characters of the free areas, in particular the slope of the roads, the extent of open or closed spaces, the pavings' types. The objective is to identify the current critical points, searching for solutions.

presence of different pavings. The presence of a larger or smaller extent of open or closed spaces was also identified, influencing the appearance and today's environmental quality too. The objective, reached by many working groups, has been to understand the positive or negative values, at this time, of the various components that characterize the environment, to define important parameters of was also identified, influencing the appearance and today's environmental quality too. The objective,

Fig. 5: Survey performed with the laser scanner of the fronts and of the planimetric development of the *ricetto*'s two streets.

reached by many working groups, has been to understand the positive or negative values, at this time, of the various components that characterize the environment, to define important parameters of evaluation, on which the restoration works were planned.

In parallel to this analysis, shown here through some brief representation, the survey was performed at the urban scale with the laser scanner (Fig. 5). A survey executed simultaneously on both fronts of the two streets, which led to the interesting result of obtaining the dimensionally controlled and realistic image of each front of the street. The obtained result allows us to capture the environment's appearance in its entirety, which is impossible in reality, for its too narrow and articulate development.

It is also interesting to notice, by the image of the survey, that the weight of the building types differs from those of the ancient centre of the *ricetto*, about which we mentioned above. [5]

With a further change of scale, the survey took into account some buildings of the *ricetto* and of the surroundings, buildings that offered interesting ideas to investigate their conformation, and in particular the physical transformations suffered over time. From the survey in direct contact with the building,

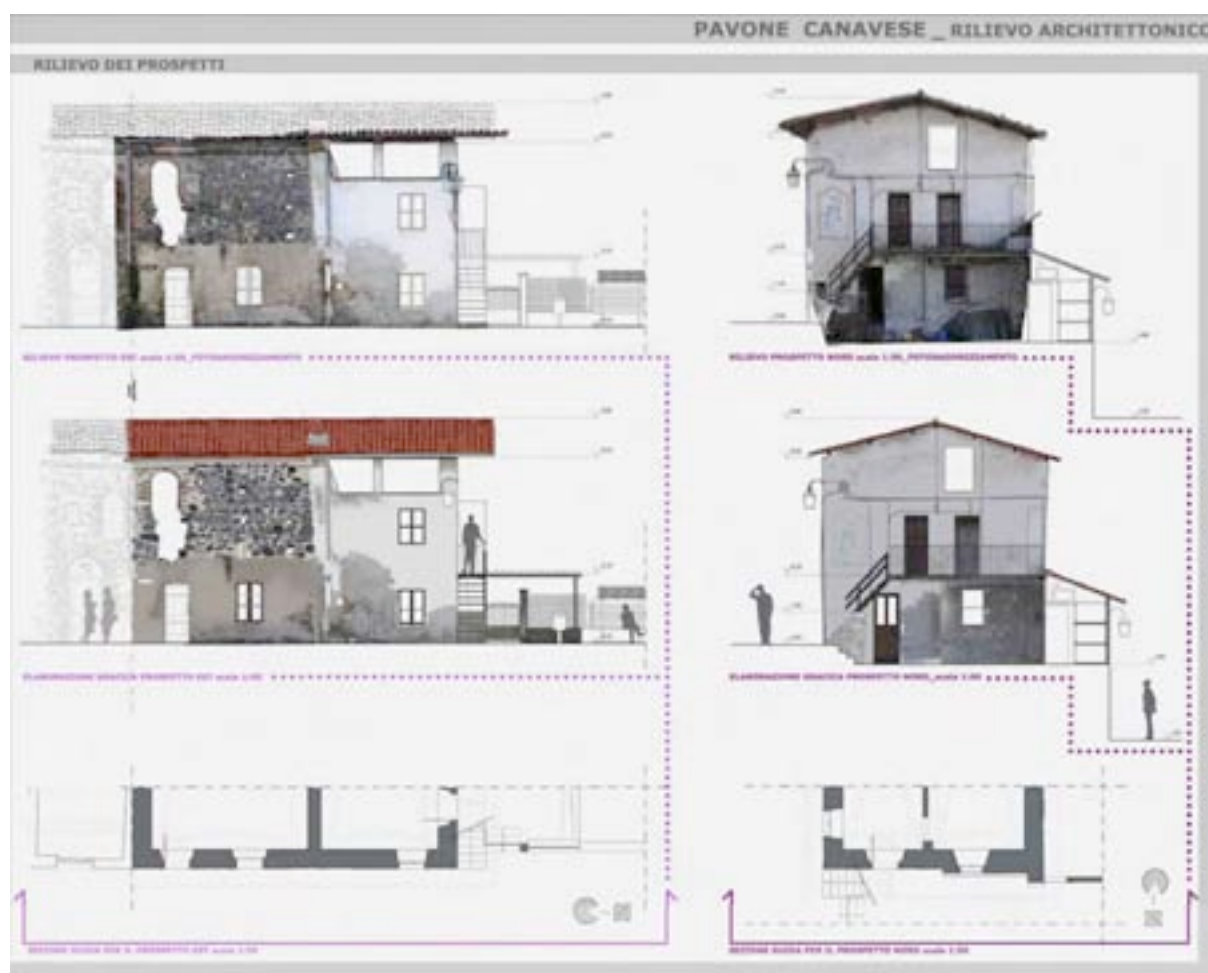

Fig. 6: Survey of one of the buildings of the *ricetto*, made with the integration of the results obtained through the analytical straightening of digital images and the direct survey. This representation highlights the presence of different textures walls, showing the transformations that have occurred over the centuries.

and from the understanding and measurement of all its parts, the main features related to the original typology or to possible transformations have been focused, acquired as important notes to be considered in the steps of restoration and redevelopment of the architectural object.

Afterwards the survey of each building was represented through various vertical and horizontal sections. The graphic rendering of the fronts was obtained by comparing and integrating the results reached with the analytical straightening of digital images and with the direct survey (Fig. 6).

A similar experience, but extended to the area surrounding the building, is illustrated here through some parts of the drawings and images that document it (Figg. 7, 8). The surveyed building is one of the *ciabòt* existing in the area surrounding Pavone, a small building that acquires importance only if put in the context of the vineyard to which it belongs. A vineyard that develops along the slopes of the hill, showing the wooden structure supporting the trellis, leaning against dry-stone walls, the famous *tupìun*. The valuable design of the vineyard landscape was the subject of a topographic survey, whose graphic rendering has been debated for a long time, in an attempt to highlight (with these and other drawings) dominant characters which constitute the value of the natural and anthropized landscape.

As we have seen from the suggested examples - which represent only a very brief extract of the works done in the Atelier - the survey's study of the characteristic elements of the village of Pavone and of its territory allowed us to identify them as factors of recognizability of the local heritage. Beyond the single results, I believe that this long range work, which has been able to involve the local community, has produced a probably more important result than the one strictly didactic: making the inhabitants of Pavone more aware of their municipality's historical values, which they themselves will be able to preserve.

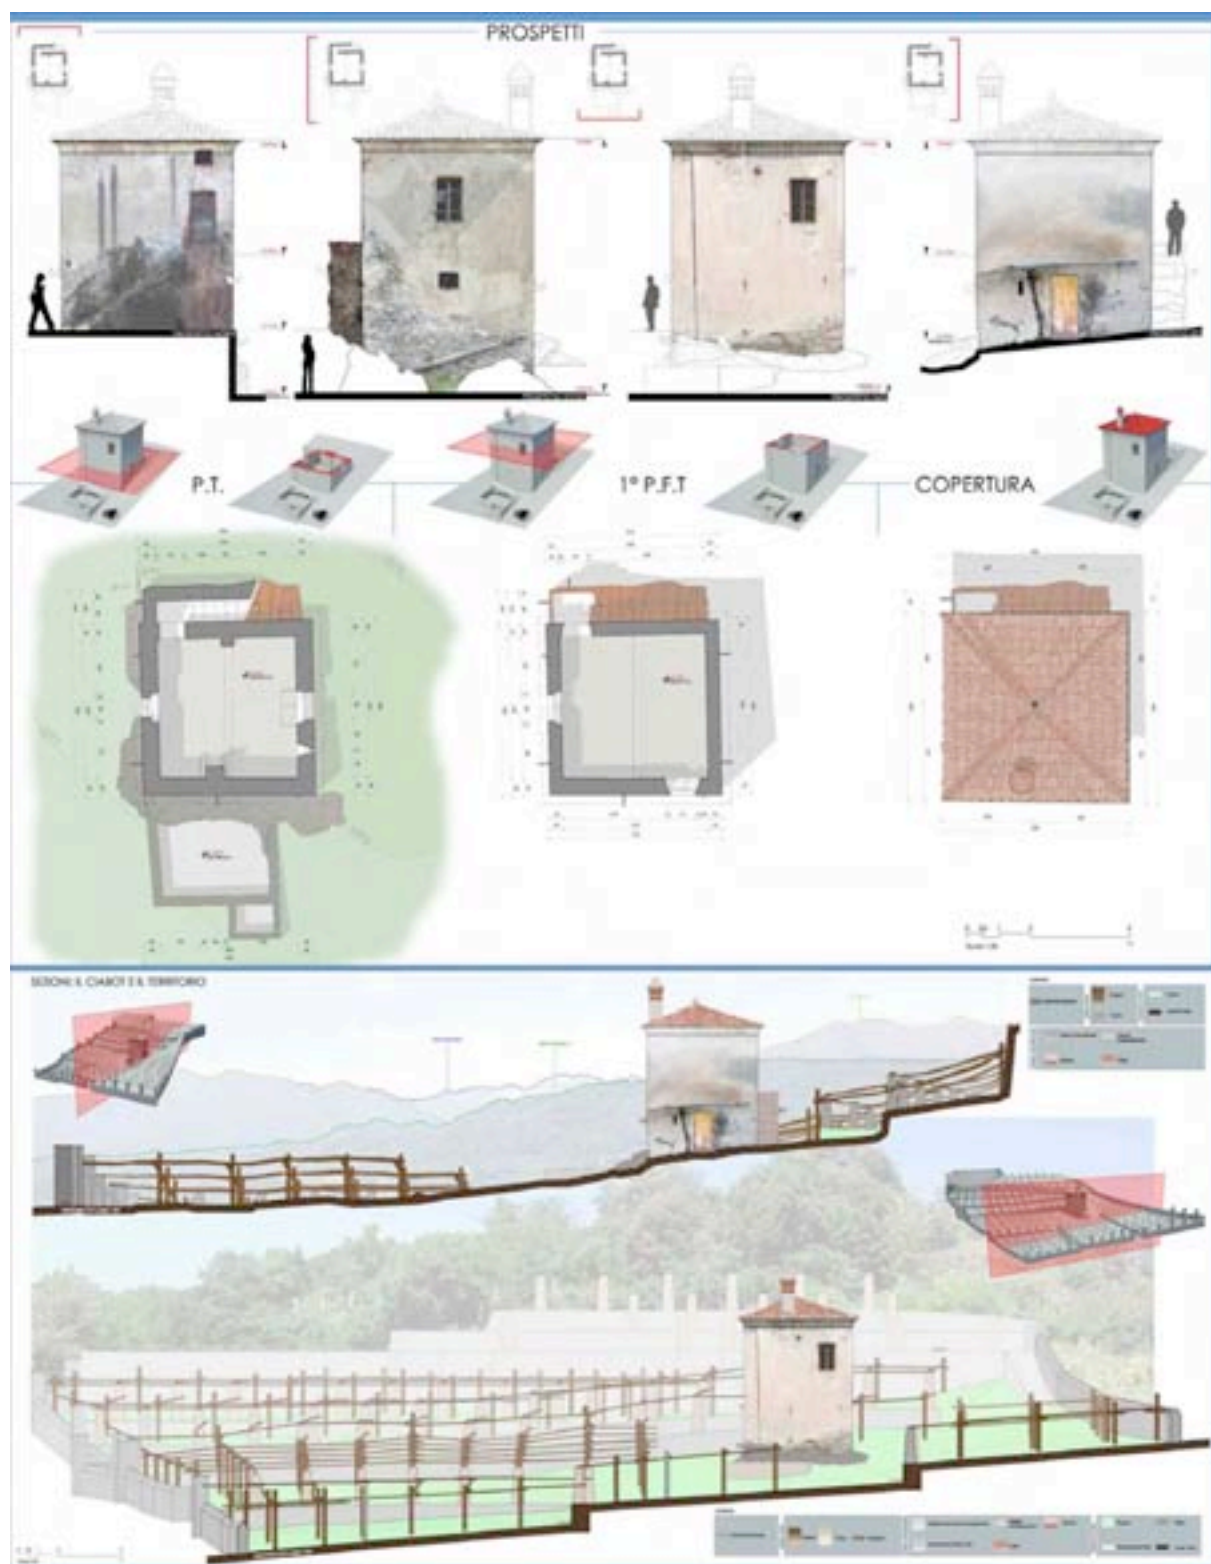

Fig. 7: Survey of a *ciabòt*, one of the small buildings existing within the vineyards surrounding Pavone. The survey highlights the strong link between the building and the structure of the vineyards that develop along the slopes of the hills.

Fig. 8: Summary of the survey's phases from the topographic to the one of the direct method, with the analysis of the architectural form and of its degradation. In particular, in addition to the *ciabòt*, the enclosure wall with access to the lot, an important element in its environmental character, was surveyed in detail.

Abstract

Recently the city of Málaga has undergone a process of urban transformation, promoting the regeneration of an old town center with great historical and cultural value.

In this process highlights the conservation project of the Roman Theater, developed by the architects Antonio Tejedor and Mercedes Linares. During the intervention, it was carried out a thorough classification of the archaeological remains through advanced computer procedures, and the reconstruction of the spaces was based on procedures of anastylosis, reconstructing the cultural heritage through the remains of its own ruins.

The conservation actions were completed with the creation of a Visitors Centre, constituted by a totally contemporary architectural piece. The materiality of the new building gives it a character of lightness and provisionality, using glass and wood. Inside, the building shows the visitors the history of the Roman monument.

Thereby, the recovery of the Roman Theatre of Malaga constitutes an intervention model very interesting, where the conservation of the original elements coexists symbiotically with the contemporary architectural contributions. It demonstrates how the implementation of suitable urban and heritage strategies, can allow a transformation of our cities without renouncing to the conservation of their pasts.

Keywords: anastylosis, andalusian heritage, conservation project, Roman Theater of Málaga.

1. Presentation: Transformation of the city of Malaga

Recently the city of Málaga has undergone a series of urban transformations that have changed its urban stage. These variations have had as one of its goals the revival of the historical, artistic and cultural life of the city. Largely for this reason, it is becoming the Historical Center of Malaga since the nineties [1]. So, the urban and heritage actions practiced in the city, joined with its privileged location on the Costa del Sol, make Malaga a focus of cultural tourism. The transforming work of the Historical Center of Malaga is embodied in *Plan Especial de Protección y Reforma Interior del Centro* in 1986, which continues until 1999 thanks to funds of *Plan Urban*, funds of *Interreg de la Unión Europea*, aid municipal and private initiative. Another incentive of transformations is program POL, that took place 2000-2004 and whose goals are to promote the commercial sector of Historical Center and create new cultural spaces. This program was funded by European funds and the city council of Malaga [1].

Those plans have resulted in the rehabilitation of the Palace of Buenavista as Picasso Museum, the conversion of the old market in Contemporary Art Center, the recovering of the Corachagarden, the action in the area of Alcazabilla, the restoration of the Roman Theatre, the intervention in the Aduana building and Alcazabilla-Gibralfaro, the rehabilitation of Rectorate of Malaga, and the qualifications of the path of the Arab Wall, among other interventions (Fig. 1)

Our goal is to study the particular case of the rehabilitation of the Roman Theatre of Malaga, situated in Alcazabilla Street, pedestrian avenue where it is held –from its rehabilitation– the most varied cultural activities: concerts, performances, festivals, etc. It is an enclave where harmonically attend a series of highly relevant architectural pieces, including the Alcazaba in Málaga, military fortification of kingdom of Taifa which it is possible a phoenician origin and an irrefutable Roman past, as recently

important ruins of this historical period have been found at the foot of the hill. Note that between the thirteenth and sixteenth centuries, the building was renovated and Alcazaba merged with the Gibralfaro Castle. Also of interest in the place cited the presence of the Picasso Museum, located in the Palace of Buenavista, with Renaissance style to which are added Plateresque façade and several Mudéjar solutions [2].

2. Appearance of the remains of Roman Theater

Numerous proposals have suggested the demolition of the Alcazaba in Málaga, charting new alignments and gradients, but fortunately they did not ever undertake due to budgetary constraints. The proposals demolition can be explained by the poor image that the Alcazaba radiated, because neighbours had their houses inside in appalling conditions, both internally and externally, living in humble dwellings attached to the wall of the fort from the eighteenth century.

After the visit of Leopoldo Torres Balbás to Málaga in 1933, it was assigned to Ricardo Orueta the project to recover the Alcazaba and its surroundings, considering that it was declared National Monument in 1931 [3] (Fig. 2). In this context, it is projected the Casa de la Cultura, where years later it would find the remains of the Roman Theatre. In 1940 the *Diputación* and the City Council reached an agreement on the construction of the Palacio de Archivos, Bibliotecas y Museos of Málaga, group known as the Casa de la Cultura. The assignment of the project was made by Luis Moya Blanco, who built the file-library, but not before several cheap houses knock on the street Alcazabilla [3]. Gradually, the street was being transformed into an institutional avenue with public equipment, such as the Theater Albeniz (1947), the neorationalist building of Enrique Atencia (1948), the Palacio de Archivo y las Bibliotecas.

Years later, when the building of Casa de la Cultura was being completed, in the process of excavation of land necessary to act on a wall of Alcazaba, remains of blocks were found forming an arbor. At first it was thought that it was an ancient city gate, until the appearance of bleachers and it was known that they are the remains of a Roman Theater. Despite this, the construction of the new building continued and was inaugurated on 30th April, 1956 [3].

Subsequently, as a result of the finding named, it was decided to address the recovery jobs of the Roman Theatre in 1957, initially focusing on the recovery of the main access and south side door, located next to the gardens of the Casa de la Cultura. So, the architect named Pons Sorolla who in 1958 would take care of the "*discovery of the Theater Works and ambience of the area*" [3].

In the second phase of the operation, a large area was excavated in a short time and without archaeological strict control, which caused a great loss of data and countless archaeological items value. Two years later, they classified the material found which would be used as a container of the same file next to a sector. The third phase would be undertaken in 1961, placing the blocks of the bleachers from the excavation supported on a new surface.

Finally, in 1995 the Casa de la Cultura was demolished, under the leadership of architect Rafael Martín. The demolition of this, but resulted in the loss of a valuable building not only for its architecture but also for hosting the Library and Regional File, on the other hand it contributed to recovery the Theater, showing the west wall of the Alcazaba, and allowing to appreciate the relationship between the fort and the city. In the demolition there were several problems of execution; one of them was the elimination of the foundation of the Casa de la Cultura – anchored at Roman Theater-, which required a delicate task of excavation [3]. (Fig. 3)

3. Historical research of archaeological remains

The research about the Theatre has revealed that in the area archaeological roman remains were located, other than verifying the presence of a Phoenician settlement in the seventh century before Christ. It was also found the existence of public baths in the first century before Christ, which were destroyed for implementing the scene use building [4]. Thus the Theatre dates from the early years of Augustus, and its function was maintained until the third century after Christ. In later centuries, the building would be converted to other uses as a cemetery in the centuries V-VI after Christ, military compound in the century VIII, and finally site occupied by humble homes in century XIX [5].

According to research by Corrales [3], it has been shown that the theater was conceived as: "... a free building with a semicircular bleacher, belonging to the building type called mixed or semi-built, therefore, it taking advantage of the slope of the hill and also makes an important artificial terrace construction to support terraces".

Thus, in the theater is divided into following parts:

- Cauea*: grandstand, where spectators are situated. He's thirty-meter radius of sixteen high. Within the bleachers are distinguished: *inma cavea*, *media cavea* and the *cavea sunma*, separated by corridors.
- Orchestra*: semicircular space of fifteen meters, where famous people were placed lower.
- Proscaenium*: stage. We must distinguish between *pulpitum* -place of representation- and *pulpiti frons* -front wall that served as protection and have an acoustic function-.
- Vomitorium*: main entrances to the stands.

-*Aditus maximus*: main entrance to the *orchestra*.

-*Parascenium*: stage sides.

After extraction work of archaeological remains, we can state that kept half the *cauea* addition to the *orchestra*, the *aditus*, the marble floor and marble grilles to drain water passing below the base of stage [6]. As for *pulpitum*, had an excellent decorative richness to be made from a variety of marbles. The *frons pulpiti* was retained a central exedra, exactly where the stairs connecting the *orchestra* with stage [3] (Fig. 4).

4. Intervention Project

With the intervention of the Roman theater of Málaga, the Consejería de Cultura of Andalucía sought recovery of the archaeological site, thus a place for receiving tourists and holding performances was setting up. The intervention project was entrusted to the architects Antonio Tejedor and Mercedes Linares (Figs. 5 & 6). As a preface, it began with an exhaustive classification and characterization of the elements discovered in archaeological excavations. As for how to deal with the recovery work, we chose to employ procedures anastylosis in much of the building as *cauea*, the *orchestra* and the *frons-pulpiti* [7], the meaning of anastylosis is a physical reconstruction, and even virtual of a site or monument from its ruins. It is a method criticized for the difficulty of knowing with certainty the hypothetical original layout remains. That is why in the present case, in order to successfully bring the return of parts to its original position, it was necessary to apply advanced mathematics to archeology. Based on the principle that knowing the radius of any part of a tier, each ashlar can be positioned in the stands, which the performance was achieved on the remains minimal direct out. Despite the above, new rows of travertine *cauea* would be over building with the same tone in 1996, and years later, Iroko wood would be placed on a floor *pulpitum* (Figs. 7 & 8).

Theatre Rehabilitation is finally completed with the construction of a contemporary piece of architecture; it was designed to function as a reception of the archaeological site. This is a free piece of 170 m², located perpendicular to Alcazabilla Street, which is the end of the party wall of building called Albéniz (Fig. 9). Among the new functions of the piece are to introduce the visitor to the exhibition, organize the visit routes, and report on the values of archaeological site. The materiality of the new piece of architecture encourages lightness and provisional, having etched glass and wood used in its construction. The interior of the building is in constant dialogue with the outside (Figs. 10 & 11), the new building accommodates various elements found in the excavations that require certain conditions of conservation and protection, as small sculptural elements, plaques and headstones, ornamental reliefs, masks and sconces, chandeliers, inscriptions, musical instruments, coins, ... [8]. The building also has an exhibition of mockups and screening room. The building also includes a gazebo in the southern part of *aditus*, a light wooden platform that leans slightly to the *cauea* (Fig. 12). In terms of lighting and irrigation installations, which are placed under the wooden platform, that it is complementing with light and sound installations with three restraints located in *cauea* [8]. As a public building that is, it must comply with the rules of safety and accessibility; this is why they set a series of additional structures in *cauea* like handrails, seats and stairs adapted.

After intervention, the theater currently develops a dual functionality as a museum and as a public stage. Finally, we would like to note that recently a very interesting initiative has been taken in order to the maintenance of the monument. It is the creation of an International Festival, whose profits are intended solely to the conservation of the building. These types of actions are which, together with the necessary implementation of suitable economic and urban strategies, transform and improve our cities.

Designing Future Heritage: Aldo Rossi's *Città Analoga* as Incomplete Algorithm of Individual Expression within Collective Imagination

Jean-Pierre Chupin

Director of the Research Chair on Competitions and Contemporary Practices in Architecture and codirector of the Laboratoire d'étude de l'architecture potentielle (L.E.A.P),
School of Architecture, Université de Montréal (www.leap.umontreal.ca)
jean-pierre.chupin@umontreal.ca

Abstract

Left unfinished at the turn of the 1980s, partly published as *A Scientific Autobiography* (1981), and since the unveiling of his personal notebooks (*quaderni azzurri*) by the Getty Research Institute in 1999, Aldo Rossi's theory of the *Città analoga* (Analogous City) can now be recognised as an original algorithm of architectural design within historical contexts. Furthermore, Aldo Rossi's analogical principles can be included in a general theory of the role of analogical thinking in design thinking be it at the architectural, landscape or urban scales. In a widespread situation of cultural uncertainty, the concept of the analogous city proposed to establish new relationships between "reality and imagination." This reality concerned the state of cities, historic centres and suburbs of Italy in the early 1970s and the fault – for Rossi – lay with architects as well as with critics and theorists unable to offer anything convincing against land speculation and fraudulent historic preservation. Among the problems listed by Rossi were broad questions on the role of architecture or the training of the architect, to issues of the city in a crisis of modernity: all still pertinent in our present condition. This criticism led him to set out two hypotheses: imagination and analogy. Although, in retrospect, Rossi's theory is illuminating in many ways, it is understood that he could have seemed cryptic in his Jungian tinted call to the problematic concept of "collective imagination".

Keywords: Analogous City, Aldo Rossi, imagination, analogical thinking, cultural landscapes

1. Aldo Rossi in search of design method in historical urban contexts

How can an architect intervene in a historical context without putting in danger the inherent quality of a city or a place? How can a project be in tune with the complexity of past and future urban interventions? In other words, what would be the most appropriate way to design the "architecture of the city"? If it is well known that some of these everlasting issues have been carefully addressed in Aldo Rossi first work as early as 1966, in his classic *L'Architettura della Città*, it is also understood by most readers and followers that Rossi was not entirely satisfied with this first essay. Although some of his proposals have given way to a series of design methods of what came to be named the "typological / morphological" school, it was not clear in this seminal book how to operate in the complexity of urban texture from a contemporary, if not postmodern, standpoint. Since 1999, thanks to the reproduction his *quaderni azzurri*, blue notebooks gathering a collection of notes devoted to architecture that cover the period 1968 to 1992, we understand a bit better Aldo Rossi's reflexive path during a pivotal phase of his intellectual and professional maturity [1]. These notebooks reveal that as of 1969 (barely three years after the publication of *L'Architettura della Città*) Rossi envisaged the composition of a major book on the theory and pedagogy of the architectural project. In a way that could not be more symbolic, this book would have been entitled *La Città analoga*. Unless one considers certain passages in *A Scientific Autobiography* published in 1981 as fragments of such a work, the draft of the great treatise that Rossi nurtured for a time, would never see the light of day [5].

What did we know to date of the *Città analoga*? For some, it was a panel by Arduino Cantafora exhibited in Milan in 1973 (Fig. 1), for others, a provocation issued in Venice in 1976 by Rossi and some of his young assistants and disciples (Fig. 2), and for others still, a series of drawings circulating in New York in 1979, then in Toronto and elsewhere. Nothing in this would allow us to imagine the scope of the theoretical project on which Rossi worked assiduously during a period of almost 15 years. There were a few allusions to the theory of the “analogous city” as of the second Italian edition of the *L'Architettura della Città* (written in 1969, published in 1970) and in the Introduction to the Portuguese edition (written in 1971, published in 1977). But could Italian readers have imagined the central place that Rossi would accord to analogy at the turn of the 1970s? It is doubtful. Spanish readers would have had a little more luck because in 1975, Aldo Rossi published an article entitled, “La arquitectura análoga” in a special issue of the journal *2C: Construcción de la ciudad* [2]. In it he proposes a new strategy for the architectural project that rests on a definition of analogical thinking borrowed from Carl Gustav Jung, and he expresses his fascination for the analogical compositions of the painter Canaletto, master of the *vedute* and the *capriccio* (Fig. 3). But until 1976, only a few dispersed texts in Spanish, Japanese or Italian publications would be available to an attentive reader [3] [4].

Contributing to this in 1973, in the middle of the debate on *La Tendenza*, visitors to the Milan triennial discovered a large panel by Arduino Cantafora, reminiscent of the canvases of Giorgio de Chirico, enigmatically entitled “*La Città analoga*”. In this oil on canvas, measuring almost 2m in height and 7m in length, Cantafora, then a regular collaborator of Rossi's presented an urban landscape comprised of numerous architectural references. In the Introduction to the architecture section of the catalogue of the 15th Triennale, it is in his role of guest director that Rossi comments on Cantafora's panel and defines the *Città analoga* as a system of composition that refers to the human dimension of the construction of cities over time, as an ethical stance making monuments as much points of reference as the articulation of collective memory. But Rossi does not co-sign this work, which he nevertheless commissioned, presenting instead a film, “*Ornamento e delitto*,” inspired by the theories of Adolf Loos.

Fig.1: La Città Analoga by Arduino Cantafora (1973)

It must be said, that in its craftsmanship this first *Città analoga* resembles a décor, a painting more than a scene, in the double sense of theatrical and psychoanalytic, as I would now like to show with regards to the ambiguous and ambivalent version that was shown at the Venice Biennale in 1976. A collective undertaking by the architects Aldo Rossi, Eraldo Consolascio, Bruno Reichlin and Fabio Reinhart, this large, composite *Città analoga* measuring 2m by 2m is a monochromatic image (Fig. 2). This plate, intended to serve as a roadmap for *La Tendenza*, was published in most of the monographs and catalogues devoted to the oeuvre of the emblematic figure of this architectural circle of influence. Judging from issue 13 of the journal *Lotus international* that appeared in December 1976 and which devotes its opening pages to a connection ever since considered to be historic, between the explanation that Rossi gives of the *Città analoga* and the scathing response by Manfredo Tafuri, there is every indication to suggest that things were not so clear for the visitors to the Venice Biennale. Solicited by the editorial staff to comment on this image, Rossi agrees ambivalently, specifying that he is not explaining the piece, but rather stating its political and theoretical significance. In fact, as Pierluigi Nicolini will admit twenty-five years later, Aldo Rossi responded in anticipation of the attacks by Tafuri, which are included immediately after his text in this issue of *Lotus international* [4].

Among the problems that Rossi listed was nothing less than broad questions on the role of architecture or the training of the architect, to issues of the city in a crisis of modernity. In the context of a widespread situation of uncertainty, the concept of the analogous city proposed to establish new relationships between “reality and imagination.” The principle of reality concerns the state of cities, the historic centres and the suburbs of Italy in the early 1970s and the fault would lie with architects as

well as with critics and theorists unable to offer anything convincing against land speculation and fraudulent historic preservation. This reading of the modern city leads him to set out two hypotheses: imagination and analogy. Although, in retrospect, this text of Rossi's is illuminating in many ways, it is understood that he could have seemed cryptic in his criticism of contemporary architecture coupled with a call to the imagination, going far beyond an analysis of the urban developments asserted in *The Architecture of the City*: a capacity of the imagination that must be pitted against reason and fits into the scheme of that which he calls a "dialectics of the concrete".

Fig.2: *La Città Analoga* by Aldo Rossi, Fabio Reinhart, Bruno Reichlin and Eraldo Consolascio. This emblematic scene was displayed at the "Europa/America" exhibition within the Venice Biennale in 1976. It is the object of many reproductions in the majority of monographs devoted to the work of Aldo Rossi. The theoretical legend of the *Città analoga* is generally associated with this montage.

For Rossi, the hypothesis of the *Città analoga* was based on the capacity of the imagination to be born of the materiality of things in itself, of their history, and the painter's gaze, the work of Canaletto in particular, would serve as a reliable method and model. A panel framing a Venetian scene dating from 1759, here plays a decisive role that will never lose its power in Rossi's development. This painting brings together the project for the Rialto Bridge, the Basilica of Vicenza and a view of the Palazzo Chiericati, juxtaposing real or imagined projects of Palladio on a site in Venice thus constituted as an intermediary world (Fig. 3). Rossi will confirm, on many occasions, that this painting constitutes an "Analogous Venice", a Venice that is imaginary and therefore very real: "Without the capacity to imagine the future there can be no solution to the city as an essentially social fact" [4].

But, he hastens to add that the panel exhibited at the Venice Biennale is not an explanation of the analogous city, for it cannot have an interpretation! This panel (*tavola* in Italian) advances an “analogical” process – in fact a true algorithm as designers would say nowadays – consisting of making new meanings emerge from the reinsertion of objects and projects according to a relatively arbitrary montage, but one that is of a moderate automatism: the whole is aimed at expressing a sense of environment and memory. Territories, concludes Rossi, with their signs and their emblems, are also the constitutive elements of collective memory.

Fig. 3: Giovanni Antonio Canal (1697-1768) referred to his painting as “Capriccio con il ponte di Rialto secondo il progetto di Palladio, il Palazzo Chiericati e le Logge palladiane di Vicenza” (1759).

The *Analogous City* would be the emblem of a reality that one seeks to destroy but which resists. In the blue notebook number 21 (October 1976 – May 1977), a comment confirms this interpretation. In a nervous hand, Aldo Rossi qualifies the “analogous city” as “the response to the destruction of the urban centres and at the same time the construction of a new city.” If the city is the ultimate human creation, as Rossi enjoys reminding us from his first book onward, alternately citing Viollet-le-Duc and Lévi-Strauss, he writes, “[t]he quality of architecture – the quality of the human creation – is the meaning of the city.”

2. Critical fortune

Interestingly enough, and in spite of its cryptic character, the hypothesis of the *Città analoga* quickly found an echo and influence in various architectural doctrines that can be traced back in Italy, Spain, the USA or France. Indeed, we find several texts referring to analogy in the wake of Rossi’s theories, spanning nearly a decade after 1976, which include Giancarlo Durisch, Vittorio Gregotti, Ignasi de Solà-Morales Rubió and Kenneth Frampton [7]. For example, in issue 15 of *Lotus international*, Giancarlo Durisch introduces an “analogical analysis” of his house of Riva San Vitale in an article entitled, “Le figure analoghe – Analogous figures”. In 1979, this time in issue 22 of the same journal, Vittorio Gregotti also engages in the game of analogy in an article entitled, “Analogie e confronti – Analogies and comparisons.” In the two cases, we note that the composition of each page layout is as analogical as it is carefully thought out and didactic. The blossoming series of *Lotus* issues extends until 1985, when, in volume 46, Ignasi de Solà-Morales Rubió publishes a fine article entitled, “From Contrast to Analogy: Developments in the Concept of Architectural Intervention [15].” This text, that draws from the Gestalt theory of Köhler and of Koffka, returns to the question of the tension between

ancient and contemporary architecture. For Solà-Morales, the technique of photomontage or those of “analogous perspective drawings” can highlight a contrast between the old and the new that does not mean a repudiation of historical heritage. They are techniques of “extracting” that facilitate a mutual recognition between the present and the past. Alluding to (but not quoting) the title of Gilles Deleuze’s 1972 book, *Différence et répétition*, he redefines analogy by drawing at times from the project by Erik Gunnar Asplund for the extension to Göteborg’s City Hall (1913-36), and at times from Carlo Scarpa’s project for Castelvechio (1957-67). Here again, the definitions are worthy of insertion into the general framework of our inquiry into analogy. Concerning Asplund he writes: “Difference and repetition were seen simultaneously through a controlled handling of the relations between similarity and diversity that are proper to any *analogical* operation”. The architecture of Scarpa inspires in him a different understanding of architectural analogy: “Here the *analogical* procedure is not based on the visible synchronism of interdependent orders of form, but on the association made by the observer over the course of time. By this means situations of affinity are produced and, thanks to the connotative capacity of the languages evoked in the intervention, relations or links are established between the historic building – real and/or imaginary – and the elements of design that serve to make the building effectively dependent” [15].

This definition, clearly influenced by Rossi’s argument, interprets the *Città analoga* as an intermediary space between the real and the imaginary. In the end, Solà-Morales evokes the critical reception of Rossi’s “typo-morphological” analyses and confirms the failure of the architectural analysis in its operative relationship to the project. Instead he valorizes an aesthetic operation, an imaginative approach that is arbitrary and liberating (the allusion to Rossi’s proposition being evident here too), before concluding with the pertinence of the comparative dimension of analogy in architecture (as Gregotti did six years prior).

3. Aldo Rossi’s quest for an analogical algorithm

At this point we can already summarize Rossi’s path through the hypothesis of an “analogical algorithm” by distinguishing three periods:

- The first period that we could describe as “the shock of Canaletto” and which goes back to the mid-1960s;
- The second period, corresponding to a definition of analogy written in a letter from Jung to Freud which comes to light in 1975, coinciding with the publication of the first monograph on Rossi’s oeuvre by Vittorio Savi resulting in a process of an increasingly pronounced process of personal identification between Rossi’s life, his work and his theory;
- And finally the third period, which corresponds to a reading tinged with mysticism, of the surrealist novel *Mount Analogue* by René Daumal (1943), the analysis of which would go beyond the scope of this paper.

As part of this overview, we will stick to emphasizing that the reference to Canaletto will remain a consistent backdrop for Rossi, the absolute model of an operative ambition articulating the project around a principle of architectural composition. We need to focus, however, on the second period in which an obscure letter from Jung to Freud plays a major role in Rossi’s understanding of analogical thinking as opposed to rational or logical thinking. Beginning with the passage in Rossi’s text “An Analogical Architecture”, published in the Japanese journal *A+U*, the original translation by David Stewart facilitates our understanding of the issue central to our demonstration [3]. Rossi summons that which he presents as Jung’s intellectual authority in matters concerning analogy: “This concept of the analogical city has been further elaborated in the spirit of analogy toward the conception of an analogical architecture. In the correspondence between Freud and Jung, the latter defines the concept of analogy in the following way: ‘I have explained that ‘logical’ thought is what is expressed in words directed to the outside world in the form of discourse. ‘Analogical’ thought is sensed yet unreal, imagined yet silent: it is not a discourse but rather a meditation on themes of the past, an interior monologue. Logical thought is ‘thinking in words’. Analogical thought is archaic, unexpressed, and practically inexpressible in words.’ ‘I believe [writes Rossi] I have found in this definition a different sense of history conceived of not simply as fact, but rather as a series of things, of affective objects to be used by the memory of a design’”.

For Rossi, this remark of Jung’s is anything but insignificant. It opens the way, literally, to a redefinition of the history of architecture, no longer a simple repertoire but a series of affective objects mobilized by memory during the design of a project: as a “meditation of subjects from the past”. To understand how Jung’s suggestion will have a double effect of liberating both visual analogical thinking and self-censorship regarding the possibility of theorizing, and thus, to put into words, the architecture of the

city, in other words, to appreciate this confrontational turning point, it is necessary to introduce an actor and key witness to his American period. Rossi's experience of America will coincide with a characteristic acceleration of psychological explanations of the *Città analoga*, and the American architect Peter Eisenman will play a key role in this introspective phase [6].

In the catalogue for the exhibition *Aldo Rossi in America: 1976 to 1979*, Peter Eisenman publishes a first attempt to interpret that which he calls straightforwardly "analogical thought" under a title that is at once inspired and binding: "The House of the Dead as the City of Survival [8] [12]." The essay is structured in three parts functioning as a dramatic crescendo: "Part I: Architecture assassinée: Architecture Abandonnée [sic], Part II: Città analoga: The City of Survival, Part III: The House of the Dead". Few commentators will go as far as Peter Eisenman in the inferences they draw from the Jungian quotation, but all or most, reproduce it alongside the 1976 image of the *Città analoga*: as two mutually-completing emblems. We cannot however, name Eisenman as the main protagonist of analogy's Jungian spin, since Rossi himself was particularly negligent in the semantic dissemination of the translations. When we consider the phenomenon more attentively, we discover surprising operations of semantic distortion, and it requires the greatest vigilance to follow our architect quoting Jung (in his blue notebooks), from an Italian translation of the English (the original in German unpublished), translating this quotation the same year in an article in Spanish, published a few months before an English translation, figuring prominently in a Japanese journal. This quotation is found later in an American version of the original Italian (referring to the Spanish publication), but distances itself considerably from the version offered in the English publication edited by McGuire and translated by Hull and Manheim in 1974, being the most common and most reliable reference [13]. From a strictly historical point of view, it is also the first time these letters were published. One thing that is certain is that the systematic comparison of the excerpts reveals the reason for the semantic slippage: analogy's inexpressible dimension.

4. An incomplete algorithm

Today we can rightfully ask if Rossi really read in depth the correspondence between Freud and Jung, published in English and in Italian beginning in 1974, or if he was familiar only with this excerpt [13]. One could already suspect the latter from reading the monograph by Vittorio Savi, which was the first to introduce this quotation [10]. This account exposes us to a case of assisted reflexivity, all the more troubling, in that it is based precisely on the role of analogy in the architect's process of thought and creation [16]. Rossi appropriated it and the successive translations did the rest.

That said, even if Rossi on his own would have unearthed this rare passage on analogy in the correspondence of the two psychoanalysts, it is clear that its true theoretical impact could not have been based on a stronger psychoanalytical ground. Everything indicates that analogy was not at issue in this letter between Jung and Freud, which certainly did not constitute an "act of revolt" as Peter Eisenman eagerly presents it, in a translation a bit too interested in the Italian expression "*un atto rivolto all'interno*" [12] [14]." Placed in its context, the exchange confirms that Freud and Jung, who return quickly to questions of organization surrounding a colloquium on psychoanalysis, were not engaging in a major debate on the inexpressible in analogy. Unfortunately, we do not have Freud's original and probably severe letter, to which Jung replies to what must have been his mentor and friend's criticism and lambasting. We have a sense of their imminent break through this tension that grows from letter to letter, and Jung's first words reveal the severity of the misunderstanding engendered by words. From there, to say that Carl Gustav Jung is going through a period of evaluation of the unspeakable and of images, there is but one step for him to cross into a redefinition of analogy or from that which he calls "fantasy thinking."

However, we realize also that which must have deeply inspired Rossi, in this presentation of history as a "rumination on materials belonging to the past": how this singular definition of analogy did not only sink into a return to metaphysical silence, but also, resulted in self-censorship with an emphasis on the visible to the detriment of the readable, on the unconscious instead of the reflexive, and on personal fiction at the expense of theorization. Having situated the imagination at the summit of a mountain as invisible as it is unattainable, and seeing in analogy a visible door – the means to climb its contours, both scientific and autobiographical – the case of Rossi is remarkable in the way in which an architect seeks to think through a theory starting from his own projects.

Placed under the emblem of *la Città analoga* at the turn of the 1970s, the theoretical work of Aldo Rossi continues to avail itself as a hypothesis of the central place of analogy within the architectural project. Rossi's quest, which was even more personal than intellectual, nevertheless experienced setbacks that were intimately related to the risks of a body of research that led him from an attempt to state the principles of architectonic composition, to the poetic silence of a mysticism of inversion, by

passing through a Jungian redefinition of archetypal imagination, which was as risky an undertaking as it was incomplete. From that moment on, it is not so much the misinterpretations that matter, as what they reveal about a search that is openly mystical. This has to do with a definition of analogy able to formulate a theory largely going beyond the one operative goal, to make the project of architecture a process in which we never know the outcome, itself analogous to something else that we do not know: from project to project, from one silence to another. As Rossi admirably summarizes in a particularly inspired aphorism: "Perhaps a project is merely the space where the analogies in their identification with things once again arrive at silence" [5].

Invested in this quest for autonomy and opposing himself to the prospective expectations of modern architecture that, in his eyes, made a *tabula rasa* of the history of places, Rossi wanted to define the conditions of a retrospective anticipation of the architecture of the city, bringing into play memory and perception in a vision of that which Walter Benjamin called the "aura" of the city. And the architect of the "Theatre of the World" believed very early on in finding the sign of an absolute method in the emblem of the "analogous city" that would be even more aesthetic than scientific. But, that which quickly became a legend – to the point of inspiring a generation of architects, some of whom still hold high positions, particularly in the Swiss schools – however, was lost in a holistic, unifying and inexpressible conception of analogy [17]. The contradictions between the fragments of its definition were insurmountable, to the point that today we may conclude that despite his efforts, Rossi had voided analogy of its power to open up the realms of difference and otherness. When the cycle of inversions ends with bringing the player to the starting point, the risk of condemning the project to immobility and repetition is great, despite being hidden behind the talent of the poet.

Abstract

As in most Italian cities, the historic center of Perugia has been experiencing for some time now a steadily accelerating process of social deterioration. Despite this deterioration, the city center's identifying features, understood as the sum of its material and immaterial goods remains strong and rich in positive elements. The latest evidence of this continuing vitality is Perugia's candidacy to be designated as European Capital of Culture for the year 2019; the city's commitment to outfit itself with facilities and spaces capable of hosting large-scale cultural events.

In this context, the research project Kultur-Fabrik-Perugia, inspired by Stefano Boeri's invitation to "do more with less," aims to promote the revitalization of the historic center and encourage the internationalization of culture. The project is founded on the idea of transforming the historic center of Umbria's capital city into a European Capital of Culture in the literal sense, or rather, to reorganize it as a system of strategically-distributed European-state "cultural embassies," by identifying, studying, and recovering its areas and locations which are currently in disuse. These rediscovered locations will then be integrated into a network for the virtuous transformation of the city into a veritable "factory of cultural awareness and dialogue" of international rank, thus prefiguring a possible strategy for the regeneration of the historic center at no cost to the local community.

Keywords: Perugia, regeneration, culture, survey, project

1. From city-cum-museum to museum-cum-city

In 1975 the Council of Europe published a cartoon titled *It is your town: know how to protect it* signed by Yona Friedman. It listed the problems plaguing the historic centre of *Whateborough*, an imaginary sample-city built upon successive layers and integrations of the original central nucleus. The main caption was a question meant to be rhetorical: *who wants to live in a museum?* [1]. Aiming to defend the right to gain access to even the most difficult-to-get-to areas of our cities, such a question left no room for uncertainty as to what the right answer should be: *nobody!* And back then it could not have been any different. After the 1964 promulgation of the International Charter for the Conservation and Restoration of Monuments and Sites [2, pp. 162-164], museification represented a real disciplinary nightmare with which every project undertaken in the field of historic centre recovery had to come to terms. The inevitable result was its entanglement in a series of issues set against the trend to turn heritage sites of historic and artistic interest into picture-postcards. Things, however, change, and so too does our point of view. Indeed today, if posed the same question, we would not be so quick to answer and would, to the contrary, entertain several doubts. Perhaps we might even think back to what Aldo Rossi lucidly said on the topic, and that is, that the problem of the postindustrial age has never been a matter of avoiding the risk of the city-cum-museum, but rather managing the opportunities of the museum-cum-city [3, pp. 365-369]. Besides, the crusades launched against the excessive development of historic centres as picturesque discoveries placed at the mercy of tourist consumption have proven to be a failure. Consider too that, despite its small size, with 60 million people living just over 300 square kilometres, our country holds approximately 40 per cent of the planet's artistic and architectural heritage [4]. Perhaps, then, it is well worth the effort to seek out alternative solutions. Why should we not endeavour to go beyond the sterile struggle between conservation and innovation and bet, rather, on an hypothesis of reconciliation? In such a way, we would not be sitting back passively but, to the contrary, actively participating in the transformation of

our historic centres into a veritable network of cultural producers. That is to say, given that culture regards not only the past but also the present, and topics such as progress and sustainability, why not endeavour to guide the process of museification concerning our historic centres with greater virtuosity (from certain points of view it is unstoppable anyway) while contrasting the drift towards formal inbalsamation and favouring the convergence towards functional development? Besides, in the era of mass culture, museums are no longer obsolete structures or static places, but rather dynamic containers evolving all the time. They are receptacles of interrelated knowledge that, in actual fact, are the only urban component truly capable of taking on omnivorous city logic [5, 6, 7, 8]. Taking the opportunity to expose the most anachronistic of prejudices, on the one hand, it is precisely the small historic towns that participate the most in cultural activities and display the greatest capacity for innovation. On the other, not only is residential attractiveness not penalized, but it is actually fostered by the opening of local museums [9]. This is demonstrated by exemplary projects which the various local governmental bodies have taken on with great commitment and at great expense, such as the *Great Court at the British Museum* in London, the *Museumsinsel* in Berlin and the *Musée des civilisations de l'Europe et de la Méditerranée* in Marseille, or at no expense at all, such as the experiment carried out by the City of Milan *Piano City*: “240 piano concerts over three days in private apartments, studios, courtyards, and libraries, carried out thanks to the appeal made to all the pianists of Milan, including concert pianists, teachers and amateurs, to execute one piece each. A web site managed all the bookings and venues for the audience who then wandered around the city gradually piecing together their own concert programme” [10, p. 31].

2. From regional capital to European capital

The Cities of Perugia and Assisi emblematically set out on their joint venture together as candidates to become the European Capital of Culture when the respective mayors shook hands in front of a line up of flashing cameras in November 2010 [11]. Since then, the candidature has taken on form and made vital decisions, the most important of which was the competition in search of a logo. On 31 January 2011, 225 proposals were made by professionals, students and other keenly interested persons [12]. In time, and respecting its own ideals, the candidature extended its reach to all its regional boundaries where the main municipal administrations expressed their support [13]. Such support was also expressed by the President of the Region of Umbria, Catiuscia Marini [14]. The undertaking then received even greater coverage when its candidature became official on the last day of Festarch 2012 (International Festival of Architecture) that was held Perugia 5 June 2012 during which the winning proposal, created by the designer Francesco Panzella, was also presented as the official logo [15]. Nevertheless, beyond the buzz of the press, it is also obvious that the Perugiassisi 2019 Foundation is facing a complex challenge that, before anything else, implies a re-thinking of the role of urban reality in Umbria within the national and European context [16]. It implies, that is, renewed emphasis on themes such as sustainability, which should be cultural before it can be environmental, inclusiveness in social solidarity, and innovativeness in the model of development. On 12 April 2012 the Foundation (constituted by the Region of Umbria, the Municipality of Perugia and the Municipality of Assisi, with the participation of, amongst others, the University of Perugia, the University for Foreigners of Perugia, and the Academy of Fine Arts of Perugia) nominated the Administrative Board in the persons of Bruno Bracalente, as president, Stefania Giannini and Andrea Ragnetti. It then nominated the Advisory Committee, including illustrious names such as Ilaria Borletti Buitoni, Pierluigi Celli, Giuseppe De Rita, Alberto Grohmann and Bruno Toscano, and the Artistic Director, Arnaldo Colasanti. The first job that the various bodies were to carry out was to draw up a plan defining the vision on which the entire candidature should be founded: the title of European Capital of Culture is assigned on the basis of the capacity to plan events in the long term “of European significance [...] placing culture as the strategic resource for economic and social growth” [17]. It is with this very spirit that the European Union selects two nations every year whose cities, which may draw upon their own surrounding territories, can enter the competition for the title; Italy and Bulgaria were offered this possibility for the year 2019. For this reason the cities of the two nations chosen must present their final dossiers for the candidature by September 2013. In September 2014 the selection panel, made up of seven European experts and six national experts, shall select the winning city. Over the years, the coveted title has come to be known as a flywheel for economic, social and cultural growth for the cities that have been lucky enough to hold it. A case in point is Lille (2004) which significantly boosted the image of the region on an international level. To reach such an objective, however, the historic-artistic patrimony or the cultural events already up and running are not the only elements taken into consideration. An evaluation is made of the long-term cultural projects that a candidate city proposes to carry out before, during and after the year for which the title is assigned. This brings out the creative capacity to develop its own historic and cultural heritage with a sense of belonging to the European Community while favouring the use of new technologies and the involvement of young people. In particular, what this means for Perugia, Assisi and Umbria is the need to hone its capacity to re-read in an innovative fashion all those unique characteristics that have made them famous today, starting from their heritage (from

preservation to development) and including the architectural treasures (from the medieval hamlet to the smart city) while passing through (lan)design (preservation of the landscape to landscape design) [18] and thus truly transforming Perugiassisi into an “augmented European capital” of culture.

3. From a place of physical constraint to a place where ideas can freely circulate

Taking on Stefano Boeri's invitation to “do more with less” [10], the research project Kultur-Fabrik-Perugia, co-financed by ANCE Umbria and the Chamber of Commerce of Perugia, plans to promote the revitalization of the historic centre, knowledge, cultural dialogue and the internationalization of culture. Indeed, Perugia's candidature (together with Assisi and Umbria) to become the 2019 European Capital of Culture, has also brought about a collaborative project between the University of Perugia and the Perugiassisi 2019 Foundation founded on an idea which is both simple yet also subversive: to turn the historic centre of the capital city of Umbria literally into a European Capital of Culture by re-organising it as a system of “cultural embassies” of the member states of the European Union strategically distributed within its heart. Via investigation and project experimentation carried out also perhaps as learning experiences, the areas and containers currently abandoned or under-used can be sought out, taken over and brought back to life by involving them in a network aimed at virtuously transforming the city into a “knowledge factory” at an international level. One such area and container of particular importance is the former men's prison in Piazza Partigiani. It was built as a true icon in the area of greatest potential for transformation created in post-unification Perugia after the sixteenth-century Rocca Paolina, designed by Antonio da Sangallo, had been demolished by popular acclaim. Built between 1865 and 1870 on a project by Giuseppe Polani (who in the same period also signed the imposing detention structure in Turin called *Le Nuove*), the building presents distributive characteristics typical of structures for detention and segregation, with a panoptic plan with four arms and a cell-like scheme comprising nearly 350 units. The modifications the building took on in the course of the twentieth century have not, however, altered the original structure to any substantial degree and have effectively seen it through to the third millennium practically intact from the point of view of its typology. The former prison has not been used as such for more than twenty years and various proposals have been made as to what should be done with it, the most interesting of which were developed during the project *Disegnare Perugia. Tra natura e artificio* [19]. The final exhibition of this project showed sketches and plans for its transformation developed in the early nineteen-nineties in the teaching programmes enacted by the then Istituto di Disegno Architettura Urbanistica (Institute of Design & Urban Architecture). These depictions raised an issue, which is still undeniably topical today, and brought it to the attention of both the people of Perugia and the scientific community at large. Many other examples, analogous in both typology and aim, have been made throughout Italy, Europe and the world. These range from the former jail called Le Murate, in Florence, converted into a residential-managing-commercial mix on a concept by Renzo Piano, to the former jail in Ferrara that now houses the National Museum of Hebraism and the Holocaust; from the Langholmen Hotel in Stockholm to Hostel Celica in Lubiana, both former penitential centres now remodelled as hotel structures; from the Plaza de Toros Las Arenas in Barcelona, turned into a state-of-the-art shopping mall, to the New University of the Arts in London, set up in the former Granary Building after complete refurbishing; from the Jail Hostel in Ottawa, which was hewn from the former Nicholas Street Gaol, to the Liberty Hotel in Boston, built out of the former Charles Street Jail. In the wake of such transformational successes, the Advisory board of the Perugiassisi Foundation has chosen the former jail in Piazza Partigiani as both its symbolic seat and its manifesto for the candidature of Perugia as 2019 European Capital of Culture. Workshop events will be organized in conjunction with Italian universities to turn this place of physical constraint into a place where ideas can freely circulate via its transformation into a “smARTvillage”, a citadel-cum-laboratory-cum-workshop dedicated to the development and enhancement of youth creativity. At the same time a possible strategy is thus foreseen for regenerating the urban fabric at no cost for the local community so as to create yet another example, in the light of pilot experiences such as Gianfranco Caniggia's in Como, Pier Luigi Cervellati's in Bologna and Giuseppe Pagnano's in Siracusa, of a new “Italian way” of understanding historic centres and bringing them back to life.

Interpreting the Transformation of the Identity of Asmalimescit

Avşar KARABABA (MSc, PhD Candidate)

Architectural Design, Faculty of Architecture, Istanbul Technical University, Istanbul, Turkey
avsarkarababa@gmail.com

Abstract

This study focuses on an old quarter of Beyoglu in the city of Istanbul, called Asmalimescit. In the last decade this historical settlement, where once out of sight taverns, artisan shops and artist ateliers were used to be located, became a favored place for urban nightlife activities and entertainment. Both the historical pattern of its built environment and the lifestyles of its users have significant influence on the socio-cultural transformation of the area. At the same time the neo-liberal economy and the global culture politics that are transforming the area are reflected on the architectural production in the area. Transformation can be investigated in relation to the concept of identity. This study aims to interpret the identity of Asmalimescit, which is in a state of *Becoming*, as Lefebvre puts it “a continuous development ... punctuated by leaps.” In this regard, the prevalent and ongoing transformation of the identity of the area is read through relational experience. The superimposed relations of the tangible and the intangible stimuli of the area are studied through a parallax position. Could understanding Asmalimescit through the concept of identity interpreted as *Becoming* problematize the relations of materiality and immateriality and generate alternative ways of dealing with the effects of globalization?

Keywords: transformation, *Becoming*, identity, relational experience, parallax position

1. Introduction

This article attempts to understand the constant transformation of Asmalimescit through the concept of identity, which is employed to construct an interpretive framework. Asmalimescit [1] is scrutinized as a fragment of the city of Istanbul, which includes relations in itself and related to the city - and the global world on a higher scale. The transformation of its identity is explored, in Lefebvre's terms, as *Becoming*, via the contradictions of local-global, past-future, repetition-difference, tangible-intangible. In this study, the identity of Asmalimescit is understood and interpreted through relational experience of the body within space-time. Merleau-Ponty refers to the body as the source of experience, without which the experience would not be possible.[2] Furthermore he argues that the body is the very location of metamorphosis and exchange. The body produces and reproduces itself through relations it constitutes with space-time as well as other bodies. Therefore the body is not a closed and static entity, but it is open to interaction and therefore in a constant transformation. The space is also constantly transformed due to its relations with body and time, and transforms the body simultaneously.

2. Re-interpreting the Concept of Identity

In the Western oriented modern thought, identity of a place was not subject to change; it was static and frozen in time. However today, it is not possible to grasp the global world and its constantly transforming relations (economic, political, social, cultural, historical, geographical) as part of a static understanding of identity. The body perceives, experiences and imagines the space simultaneously and produces the space and also the images related to it. The concept of identity refers to these constant but ever-shifting images of a space-time, in one's consciousness. These images are reflected by space-time and are being articulated to the transformation of space-time as well as the body. Thus, moving from the tangible aspects of the space, the body relates them to its intangible aspects, and transforms both the tangible and the intangible while the concept of identity emerges and its being re-

interpreted. The ever-transforming and superimposed body-space-time relations could be explored via what Lefebvre defines as *Becoming*:

“The *Becoming* is a continuous development (an evolution) yet at the same time it is punctuated by leaps, by sudden mutations and upheavals. At the same time it is an involution, since it carries with it and takes up again the content from which it began, even while it is forming something new. No *Becoming* is indefinitely rectilinear.” [3]

Lefebvre is not referring to *Becoming*, as a development, which pursues a linear path and aims for the better. On the contrary, the path of *Becoming* is constantly being interrupted by many dynamics, regardless for the better or worse. For instance in Asmalimescit, the events of 6-7 September opening of Babylon, removal and banning outside table placement of cafés/bars could be regarded as some of the dynamics that interrupted its path. Every interruption shifts the route of the path, transforms it, along with both the subject of interruption and the path itself. Although the path of *Becoming* is not linear, the shift in its route does not put an end to its relation with its previous route. In its present route it is still in relation with its past as well as its future in one-way or the other. These shifts, the relation with the past as well as the future, the transformation of the route as well as the object and the subject that Lefebvre’s understanding of *Becoming* points to, could be employed to re-conceptualize identity as *Becoming*. For example in Asmalimescit, the inhabitation of artists to the area, due to its physical attraction and economically moderate living standards, transformed the socio-cultural environment of the area and the artists and their relation to the area. When the body encounters with tangible aspects of the site, its intangible aspects are re-constituted, putting its identity in a new route, while transforming the tangible aspects and the body simultaneously. In this regard understanding the concept of identity as *Becoming* could make it possible to explore the transformation of Asmalimescit.

Considering Lefebvre’s idea of *Becoming*, the transformation of Asmalimescit could be scrutinized in relation to its identity. It could be argued that a transformation occurs when an intervention is faced. The transformation of identity seems like a natural route of its transformation when the interventions do not cause big changes. While the space is transformed within the historical process, a political decision of the government or a personal act of a regular person, or a natural disaster such as an earthquake or flood can be the cause of that transformation as well, and can cause big changes. These interventions might shift the route of the transformation of space or change the speed (accelerate or decelerate) of transformation. It should be noted that, who or what intervenes in the transformation is also being transformed in a reflexive relationship. In this regard it could be argued that Asmalimescit is being transformed every year, every month, every day, hour and even second in relation to the perceiving body. While the body re-imagines the identity of Asmalimescit, the body simultaneously becomes the subject of intervention and it is also being transformed along with Asmalimescit and its identity.

The concept of identity as *Becoming* could be understood as a reflexive action of the body that refers to relations of the space-time and the body and also transforms them. In order to interpret the identity as *Becoming*, a parallax position should also be embraced while relational experience takes place. Relational experience indicates lived experiences of the body simultaneously producing images about space-time, shifting between contradictions of its past and future, tangible and intangible dimensions, forgetting and remembering memories and so on. The complexities and contradictions that the space has can be grasped by identity as *Becoming*, through a parallax position. According to Žižek (who borrowed the term from Karatani), parallax position refers to the shift in the understanding of the body-space-time relations, generated by the positional difference of the body that offers a new and a different line of sight.[4] Considering this, the identity of Asmalimescit could be interpreted as *Becoming* regarding the constant transformation it is being subject to via a parallax position, as long as the body relationally experiences it.

Fig.1 A Diagrammatic interpretation of Becoming

3. Reading Asmalimescit's Identity as *Becoming*

3.1. Occurrence (of a Locality)

Sitting at the Tunnel Square, at the end of Istiklal Avenue, neighboring Asmalimescit, waiting for the tram, gives one time to think about how Asmalimescit transformed not only in the past decade but during centuries as well. The Tunnel square is enclosed by the Lodge of Mevlevi Dervishes, the old Tunnel Building and the old Sixth District Municipality Building which are a few of the many reminders of its past and they relate the body to its future. These architectural productions trigger the imagination of the body, and take it to a journey in time, to both its past and its future. The Lodge of Mevlevi Dervishes reminds how and why Asmalimescit was established.

It could be claimed that Asmalimescit quarter is itself an intervention to the historical scene of Beyoglu district, since it was established as a Muslim district within a Christian and Jewish settlement. Walking down the slope of Galip Dede Road, passing through the lodge, Galata Tower is seen. The tower still stands as a reminder of the past inhabitants of the area, at a time when it was an important harbor-city. Until the Conquest of Istanbul in 15th Century, by Mehmet II, Venetian and Genovese merchants who were busy with sea trade, ruled Galata (which is now within the boundaries of the Beyoglu district). Following the dominance of the Ottoman Empire, the city extended outside the city walls of Galata, through Beyoglu (also known as Cite de Pera). Asmalimescit was established in this century as a Muslim quarter in order to form a Muslim population in the Christian and Jewish populated district. It was located, at the intersection of main trade routes of those days: Kumbharaci Street, Istiklal Street (it was not an avenue in those days) and Asmalimescit Street. In order to encourage the increase of the Muslim population the Lodge of Mevlevi Dervishes was built in the following years. Thinking back to those days it could be interpreted that the establishment of Asmalimescit quarter as well as locating a Mevlevi Dervish Lodge are political acts that shifted the economic, social and cultural relations in Galata and Beyoglu. While these establishments articulated to the non-Muslim scene of Galata they triggered the development of the area towards Beyoglu, transforming the identity of Galata. On the other hand, today they are considered as some of the main locations that give Beyoglu its identity.

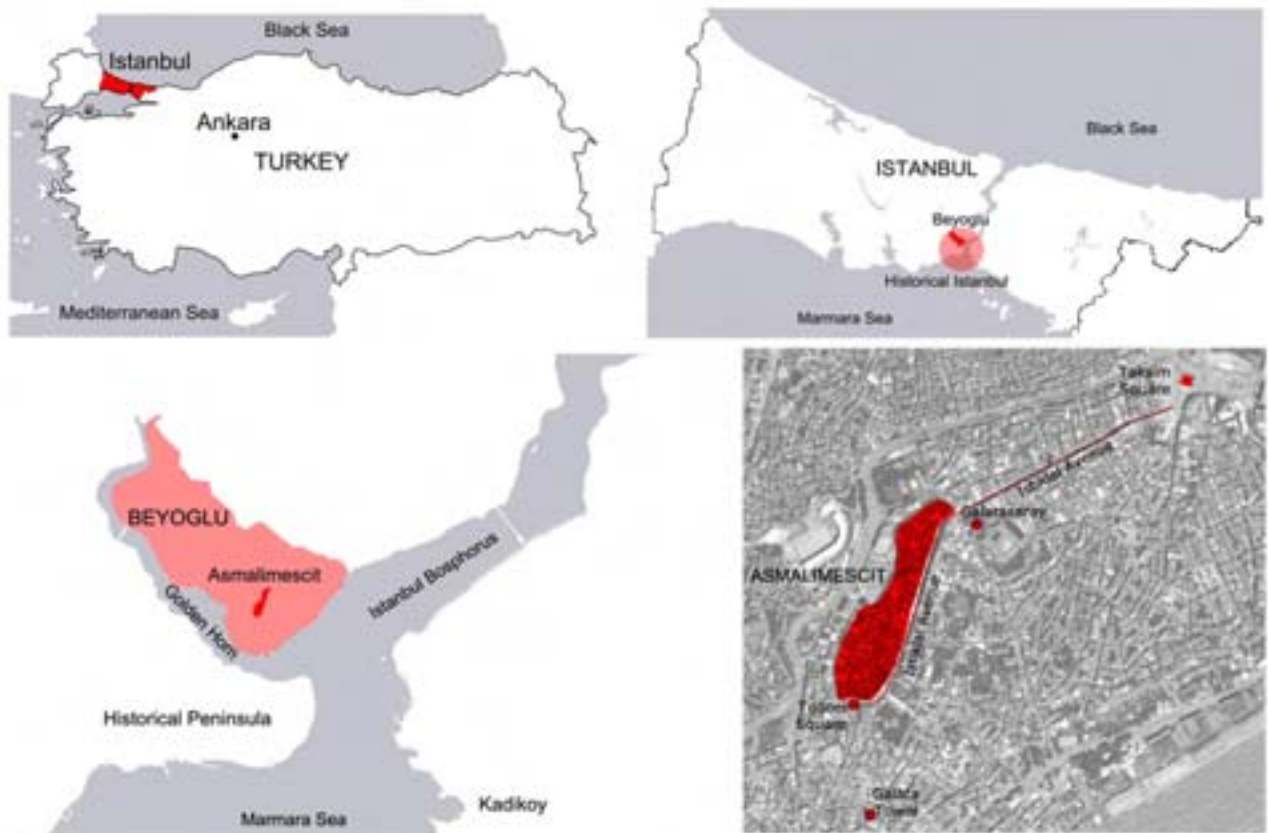

Fig 2. Location of Asmalimescit quarter.

The Sixth District Municipality building built in 1880s, which is under renovation today –a polemical process in the contemporary political and cultural scene–, reminds the glory days of both Asmalimescit quarter and Beyoglu district, gives clues about the modernization process of Ottoman Empire –and makes one anxious about the future of the area. Following the establishment of Asmalimescit quarter, keeping it as the commencement point, Galata began to extend to Beyoglu, on the main axis of Istiklal Avenue (Grand Rue de Pera). Beyoglu, especially Istiklal Avenue, was the European face of the Ottoman Empire in 18th and 19th Centuries. While strolling on Istiklal Avenue today, it is not surprising to encounter architectural productions of the glorious lifestyles of its former cosmopolite society. The embassies for international business and governmental activities, schools providing education for the European communities (Germans, French, Italian, English etc.), along with Huseyin Aga Mosque, many churches and synagogues, luxury shops selling imported products from all around the world, bohemian cafés, restaurants, bars and theatres providing rich intellectual environment, hotels offering first class accommodation for merchants and tourists, and all other necessities of a modern European lifestyle were located along and around the avenue and built in European architectural style of the time. The district benefitted from Istanbul's position as an important harbor city at the intersection of international trade routes and was dominated by the non-Muslim (Jews, Greeks, Armenians etc.) communities. Beyoglu was identified with international economy that generates cultural diversity and constitution of a cosmopolite society. It could be interpreted that the center of the district was still the Muslim populated Asmalimescit quarter. Thus the implementations regarding modernization such as the establishment of municipal governments was embodied as the Sixth District Municipality Building. Seeing this building today, wrapped with scaffold covering, makes the body to think about the future of the area as well. The contemporary renovation process of the building is undergoing in an secret way. This process raises questions on not only restoration but also the commodification of a locality, and also relates to similar implementations that take place in Asmalimescit quarter along with Istanbul in general.

The built environment offer relational experiences if the body relates itself to it by a parallax position. Architectural productions that belong both to a past and a future that could be experienced in the present, enable the body to imagine various dimensions of the locality, and produce images that resemble its identity. These images constantly shift; they re-appear in every moment and they are never fixed. The attempt to fix these images arise the problematic of aesthetization and/or commodification of the locality. Locality is a fluid and hybrid entity, which is constituted and re-constituted over and over again and transformed within the relations of body, space and time. It could be claimed that in relation to the late-capitalist economy and neo-liberal politics of the global world, since they aim to maximize profit, localities are threatened to become commodities. Asmalimescit could be referred as a locality, where the relations of body, space and time superimpose and form a complex, fluid –and endless– entity. The increased land values of Asmalimescit, due to its popularity today, attract various investors. The old buildings in the area, dating back to 19th Century are re-functioned mostly as commercial buildings, such as long or short-term accommodation buildings. However, instead of restoring the small buildings separately, as they are, the investors rebuild single but larger buildings in their places to utilize them as commercial facilities like a hotel. A single high square meter building becomes even more valuable in this area, since it does not need to be re-built, renovated with a new facade. This is what seems to take place in the old municipality building however it is not very obvious since the process takes place under covers. Furthermore, new buildings, equipped with latest technologies are designed to reflect the styles of the past, through their facades while they are re-built. Tearing down the old buildings and re-building them in the historical styles could be considered as an attitude to stabilize the locality as an image at a certain time in its history or its made-up history. In this regard the historical pattern and cultural dynamics of the area are being reduced to an image, while it is being adapted to late-capitalist relations as a commodity of material culture. This process could also be considered as an intervention to the transformation of Asmalimescit quarter.

The Tunnel Building is another reminiscent of the significance of Asmalimescit quarter in 19th century. Along with Beyoglu district, Asmalimescit quarter was highly benefiting from the technical developments of the century. Tunnel, as the world's second subway line was built in 1875, working up and down between Karakoy and Tunnel Square, and is still in use today. This modern vehicle accelerated the speed of transportation of people and goods, and triggered commercial activities in the area and transformed the social life. Construction of Tunnel as a tangible intervention to the site articulated its intangible dimensions and reflected its identity. In relation to the aforementioned interventions it could be argued that Asmalimescit gained its identity as a Muslim quarter, which was not densely populated but has preserved its importance in economic, political and socio-cultural scene of Beyoglu for almost two centuries (18th and 19th Centuries).

3.2. Decay

Passing through the Tunnel Passage, just across the Tunnel Building, the body finds itself in Asmalimescit. The tables and chairs scattered on both sides and even on the hallway of the passage, inviting the body to sit for a moment and explore its historical atmosphere. The apartment blocks that constitute the passage are delicate examples of the productions of modern European architecture of 19th and 20th Centuries in Asmalimescit. They are the resembles of the 5-6 story apartment blocks in Asmalimescit quarter which were built with modern infrastructures of their times such as elevators, making them favored places in the first half of the 20th Century. Walking across the Sofyali Street, occupied with bars, cafes and restaurants on both sides, the body reaches Asmalimescit Street. Yakub Tavern and the Asmalı Cavit Tavern just across it are some of the taverns that have been settled in the historical buildings of the area on this street. Their physical existences as well as their functions allow the body to remember the socio-cultural scene of Asmalimescit in the first half of the 20th Century.

Following the fall of the empire and proclaim of the Republic of Turkey in 1923, Istanbul was losing its importance slightly in the global arena. This could be noted as another intervention to Beyoglu as well as Asmalimescit quarter that shift the social, cultural and economic relations in Asmalimescit. Although the population of non-Muslim communities had decreased due to the political and economic implementations of the Republic, they continued to live in the district and pursue the lifestyle they grew up with, in a moderate way until the 1950s. In those days, Asmalimescit was not only hosting artisan shops and artist ateliers but also entertainment places such as taverns. The White Russians owned these taverns that give service to the non-Muslim community living and working in Beyoglu (including Galata), as well as the intellectual community of the new Republic.[5] Unlike today, Asmalimescit was also an accommodation place for the people who worked in the shops and restaurants of the area. Today the land-value of the area is probably higher than ever increasing the rents as well. However, raise of the luxury apartments do not date back more then a decade, since the socio-cultural scene as well as the economical activities that took place in 1950s was to shift once more.

Strolling in the narrow, empty streets of Asmalimescit in 2002, old buildings, most of them left to decay were giving a gloomy atmosphere to the area. Different from today, there were only a few daytime cafés and a few out of sight taverns. It was not hard to tell that something had happened and was only beginning to be recovered. The decaying, abandoned buildings, recall the unpleasant memories of 6-7 September. In September 1955 a bomb was set in Atatürk's house in Selanik. 6-7 September refers to the event that began as a protest, especially in the streets of Beyoglu, and turned into indignation and the actions of plunder and destruction towards the Greek community. This event forced the Greek minority to emigrate, who were highly populated in Beyoglu. This event, which was a political act, could be considered as severe intervention both in Beyoglu in general, and Asmalimescit in particular. When Beyoglu district was abandoned in the mid 1950s and 1960s, Asmalimescit was also neglected. Abandoned houses of the minorities in Beyoglu were occupied by the workers migrated from Anatolia in the 1960s. In the following decades, Beyoglu and Istiklal Avenue slowly fell from grace. The glittering lifestyle of the area, which dominated its identity for the past two centuries, was a history. In the mid 1970s until the end of 1990s Beyoglu was a rundown city center.

3.3. Rebirth

Entering Sehbender Street one Friday night, the crowd makes it hard to walk, but forces the body to hang around and identify the reason of the crowd. The crowd is probably waiting for a band, whose concert is about to begin at Babylon Music Hall. Babylon Music Hall could be referred as the first significant intervention to the area in the recent past that enabled the body to re-think Asmalimescit, both before and after its operation and re-discover its past and relate to its future. At the end of the 1980s some of the artists started to move into the district, because of the low-rents and the attraction old buildings. The area evoked a bohemian image, with various artisan shops, artist ateliers and introverted daytime cafés where the regular customers were actors, musicians, poets, writers and fine-art artists and their assistants who live and/or work in the area.

It could be stated that following the opening of Babylon Music Hall in 1999, Asmalimescit was developed into one of the focal points of eating, drinking and entertainment in Istanbul, that still dominates its identity. It was designed and built as a music hall and it introduced live music concerts to the nightlife scene of Beyoglu. Fans of musicians and groups started to visit Asmalimescit more, to listen to the concerts taking place at Bablyon. In the following years, especially the ground floors of the historical apartment blocks began to be re-functioned as cafés and bars for knocking back a few drinks before the concert. In the 1990s Asmalimescit was a hide-away place in the nightlife scene of Beyoglu for artists and university students, but this was changing due to the appearance of Babylon.

Although Istiklal Avenue was developed historically from Asmalimescit to Taksim Square, part of the avenue between Galatasaray and Tunnel Square was a secluded place, from 1970s until mid-2000s. Following the articulation of new eating, drinking and entertainment places, to the historical taverns, intelligentsias as well as university students began to visit Asmalimescit more. This motive force-

increased the circulation between Galatasaray and Tunnel Square as well and encouraged new shops and restaurants to be located along the route. As the regular customers of Asmalimescit were increasing, some new customer types also evolved, such as urban professionals working at the corporate firms and foreigners who stayed for either long or short term in Istanbul. Babylon Lounge, which is connected to Babylon Music Hall inside the building, but faces a parallel street, points to the transformation of the user profile of the area in relation with its built environment. While some new buildings were added to the setting of Asmalimescit, such as Babylon Lounge, the renovation of decaying historical buildings were also supporting this transformation (Fig.3). While strolling around the streets of Asmalimescit, the boutique of the fashion designer Umit Unal or the interior architecture firm Autoban and its showroom are some of the few stores and offices that the body can come across. The site is also a host for creative industries such as the Apartment Project, an exhibition and interdisciplinary collaboration space for artists. This diversity of functions –as the tangible aspect of the site-, emerges from its economical potentials and the socio-cultural environment –as its intangible aspects. Simultaneously these functions transform the site from a hideaway place of the artists and students to a new gathering place in the city as well as provide prestige to offices and attract the creative industries. While the body experiencing its tangible and intangible aspects, constitutes and re-constitutes the identity of Asmalimescit as *Becoming*, the forces/relations of global capitalism pulls its transformation into another direction, by favoring the material culture. The popularity of Asmalimescit becomes an attraction for the investors who wish to make profit out of its vivid cultural scene and for its present local government who aims to market its locality to them. The local government (in relation to general government policies) put the culture politics of neo-liberal economy into work. The neo-liberal economy and the politics that place culture to its center, regard culture not as an entity that emerges in a historical process but rather as a given thing. Regarding culture as a given thing, freezes its historical process and converts culture into a commodity. The locality and its culture that exists in relation to it, becomes a tool for generating heterogeneity as cultural difference and market it under the name of local culture. This kind of production of difference points to the production and consumption relations of late-capitalist economy: the mass-customization of post-industrialization. In Asmalimescit, the entertainment places, cafés and hotels that only aim to make profit, hold on to its culture through its historical pattern, and freeze it as an image by reproducing the historical buildings. Since these places serve to an image of culture that is not subject to transformation they are not being articulated to the locality and become an extension of its social and cultural life. However, since they survive with this image of culture, they also wish to stabilize the culture of Asmalimescit in time as an attractive entertainment place that smells history. In this regard the material culture of Asmalimescit is predominated and its locality carries the risk of being commodified. On the other hand the transformation of Asmalimescit continues due to the effects of global socio-politics.

Fig. 3: Diagrammatic interpretation of Asmalimescit through old-new contradiction / tension.

Fig. 4: Diagrammatic interpretation of Asmalimescit through indoor-outdoor contradiction / tension.

The pale yellow light of the lit historical buildings mix with the warm red lights of the heaters, located outside, hanging down from the ceiling of the balconies on the ground floor of the cafés. This combination gave Asmalimescit a cozy atmosphere at night while making you think of both the smoking ban in Turkey and the outside table placement ban in Asmalimescit (as well as Beyoglu). Regarding the process of alignment with the European Union (EU) norms, Turkey banned smoking in indoor public areas in 2008. This ban can be considered as an intervention of the general government, triggered by global forces, that deeply transformed Asmalimescit's new identity as a popular night-life spot. As a way of dealing with this ban, the shop owners took permission from the local government to place tables and chairs on the narrow streets of the quarter. The establishments located heaters on the walls to host their guests outdoors even in the cold days. In the mid-2000s, the refreshed face of Asmalimescit was already attracting people. People enjoying themselves in the streets made the guest population of the area visible. As the population was rendered visible the quarter was turning into a popular place for both daytime use and nightlife activities. The street tables were full of people, and the pedestrian flow on the streets was dense especially in the evenings and at night. Tunnel Square became a meeting point at nights where people were enjoying their drinks, from the enclosed bars such as Lokal, while stretching along the square. Another hotspot of the quarter was Otto, at the end of Sehbender Street. Otto was not only a restaurant-bar, but its music spreading into the street from within was one of the transformative powers of Asmalimescit for half a decade. People were dancing, chatting and meeting with each other in an interactive relationship with the place through the immaterial aspect of music (Fig.4).

Today that crowd is not visible on the outside because of the table ban of the local government. The crowded streets are left empty, while the users moved to the terraces of the buildings, or the back gardens on the ground floors. For the ones who preferred to stay on the street (for smoking or breathing in the autumn breeze) were moved to the tiny balconies added to the buildings. These balconies could be read as the reflection of a political act and the social and economical reaction to it, to the built environment. While strolling around in the emptier streets of Asmalimescit at one autumn night, the times when it was hard to move along the street to go to the bar you were supposed to meet with your friends could come to the memory. The streets, where you came across with very few people today, remind you the street filled with tables on both sides, people enjoying themselves on the street, while eating, drinking, smoking, talking and laughing. The table-free streets become the trigger for the dreams of its future while at the same time it becomes a reminder of the recent past of Asmalimescit. Just like when the crowded streets with the people and tables were the reminder of the times when the place was only know by regular costumers of out of sight taverns and artisan ateliers. The interplay between the contradictions and tensions of the locality, in one's mind, produces and reproduces the space and the body continuously over and over again. Flashes of past memories and future imaginations, experiences of the materiality of the empty streets and the immateriality of the emotions it recalls when it was crowded and full of life make it possible to experience the identity of Asmalimescit -that is in a constant transformation- as *Becoming* (Fig.5).

Fig. 5: Diagrammatic interpretation of Asmalimescit through flow-pause contradiction / tension.

4. Concluding Remarks

The architectural production that belongs both to a past and a future, that could be perceived, lived and imagined at the present, work as an interface to interpret the identity of Asmalimescit as *Becoming*. The architectural production and the built urban environment of Asmalimescit can be regarded as one of the prominent elements that offer a relational experience to the body, when the body embodies a parallax position. The differences in the background of different bodies generate many identities of Asmalimescit through their relational experiences. These identities shift at every moment, since the bodies are transformed at every encounter with the locality, and transform it. In this regard, the concept of identity could be re-interpreted, not only as something that refers to a multiplicity, but also as *Becoming*, that is in a constant transformation simultaneously departing from the body and space time through the interplay of contradictions and contrasts.

It could be argued that the transformation took place in Asmalimescit during centuries was due to the interaction of the people with the place, in every scale, that shift the relations in it, while they are being a part of its transformation and being transformed. In the contemporary world, this transformation carries the risk to be manipulated in the favor of neo-liberal economy of global capitalism though its culture politics. The neo-liberal culture politics seek to engender the materiality of the built environment as opposed to its immateriality by commodifying the localities. This tendency could be unstabilized, through the understanding of identity as *Becoming*. This understanding of identity puts the interplay of material and immaterial into work. The interplay of materiality and immateriality that the body generates, do not aim to predominate one another or balance them at one point, but become the reason for the body to constantly transform both of them, through which the identity is explored as *Becoming*.

Abstract

Snow avalanche hazard in the Alpine region represents a dramatic factor of risk not only for skiers and mountaineers but also for dwellings and villages, with relevant consequences for local economies and transportation networks.

Traditional alpine architecture and land planning show that, in the past, there was respect of humans versus Nature. Nowadays, the increasing demand of building and leisure spaces pushes the occupancy of the territory to more risky areas where appropriate design is therefore needed.

Modern techniques of land surveying, e.g., laser scanner and 3D CAD, permit to model the avalanche phenomenon with great precision and to study the effects of impacts against buildings and structures, thereby enhancing the mapping of associated risk and suggesting strategies for protection. An experimental site has been realized by the Politecnico di Torino in the Gressoney Mountains - Valle d'Aosta, where monitoring of snow avalanches under different climatic conditions allows a progressive improvement of knowledge.

Sustainable urban planning can therefore be pursued also thanks to these modern technologies, coupled with respect to Nature and attention to traditional architectural solutions.

Keywords: snow avalanche, impact pressure, hazard maps, risk prevention and protection.

1. Introduction

The snow is one of the keys of life in mountain environments: a cover against winter frost for ground, animals and vegetation protection, renewable energy and water resource and happiness for children and adults. But today, snow is the "White Gold", the heart of the economic (tourism and winter sports industries) and social development of mountain regions. However as water with debris-flows, rocks with rocks falls, wind with tornadoes, snow can lead human-life to uncomfortable (e.g., interruption of roads or access restrictions in temporary avalanche hazard areas), dangerous (e.g., avalanche interference with populated areas such as communication routes, ski slopes, villages) and catastrophic situations (e.g., destructive avalanche impact causing damage to people and property).

Since people were settled in the mountain (from a few tens of thousands of years), an adequate protection from snow avalanches has been needed. The first historical references to avalanche were found in documents written by Greek geographer Strabo (63-23 BC) and Roman historian Livy (59 BC - 14 AD) which describes the crossing of the Alps by Hannibal (218 BC), but the first reports of accidents caused by snow avalanches go back to the retreat of the 10,000 Greek soldiers through the mountains of Armenia in 1.401 BC, told in Anabasi by Senofonte [1].

Today, along the Alpine region, the memory of the destructive power of the snow is alive as a result of the tragic 1998/99 and 2008/09 winter seasons. Characterized by exceptional avalanches, the Winter 1998/99 saw the occurrence of 850 events in February. In the week between 23.02.1999 and 01.03.1999, 12 people death, 5 buildings were destroyed together with over 200ha of forest, 6,000 people were evacuated from 1,320 buildings and 71 road sections were closed only in Valais (CH) [2]. In Austria, on February 23rd, the avalanche fell on the village of Galtuer and stroked on 24 buildings (6 completely destroyed and 7 severely damaged), with 60 people buried with 31 killed and 22 wounded. On the same day, in Italy, the avalanche of Lavancher (Morgex - AO) provoked the destruction of 1 building and 1 victim [3]. In France, the event of Montroc (Chamonix) destroyed 14 chalets and caused 12 victims [2].

December 2008 was characterized by intense precipitations, in particular in the middle of the month (14th – 17th) throughout all the Italian Western Alps. Numerous avalanches occurred causing damages to villages and affecting the viability. In Aosta Valley (IT), the winter started dramatically: from 15 to 17th the avalanche Warning Service detected 419 natural avalanches, 69 of them exceeded the avalanche cartographic limits and 68 are never detected [3]. In December 15th, under extreme snow and meteorological conditions, at about 1:00 p.m., a thick and soft snow slab of about 50.000 mc (maximum width of 350m and thickness up to 1.5 m) released from the slope "La Tour" and stopped with a big jump over Les Thoules village at 1.600m asl.. Splitting into two branches just before the regional road, the avalanche destroyed 7 houses (Fig. 1), the telephone and power lines (a lot of masts and also a high voltage pylon) and portions of wood. It also damaged buildings and one hydroelectric power-plant, interrupting the regional and the communal roads. The branch on the left side of the basin destroyed 4 houses whereas the branch on the right side impacted two chalets and one house [3, 4, 5]. In Piemonte (IT), in the period between the 15th and the 16th of December 2008, the meteorological situation and the intense avalanche activity influenced the area around Ceresole Reale, a small village at 1.570 m asl in the high Orco Valley and many avalanches occurred. Some of them have been classified as extreme avalanches and flowed in areas where no avalanches were reported in the past, overcrossing the limits of the official regional avalanche map. In particular, 4 simultaneous avalanches released from Monte Cialme and destroyed 6 houses and 12 ha of forest. The deposit and damages analysis has shown that the avalanches presented both a dense and a powder part. The volume of snow was estimated around 100.000 mc released from 2.450 m asl and flowed into the lake Ceresole at 1.580 m asl [6]. Not least are the usually Winters in Alpine regions. In Aosta Valley, the winter 2011/12 saw the avalanche interference with 3 alpine huts: the first newly built – the "Rifugio Letey" in Doues (AO), the second after maintenance – the Agriturismo "Le Lapin" in La Thuile (AO), and the latter the new extended part – the "Rifugio Bezzi" in Valgrisenche (AO)) [7].

Fig. 1: A mountain chalet in Les Thoules – Valsavarenche (AO) before and after the avalanche event in December 2008 [4, 5].

2. Avalanche risk prevention and protection

The aim of the paper is to provide a quick overview on the role of the planning, the architecture and the engineering compared to the avalanche hazard to protect human-life. From the management of avalanche hazard thanks to zoning restrictions to how to design and construct buildings against avalanche impact, the paper overcomes the gaps in our knowledge of the avalanche phenomenon, supported by field research and numerical models. These are only two paths to increase the structure safety in avalanche hazard zones considering the purpose of territory to construct new buildings and the lack of public financial support for the expensive structure defences (e.g., snow nets, tunnels, dams, etc. ...).

2.1 Planning and avalanche hazard

Today, Urbanism is one of the main tools for the prevention of avalanches.

Permanent measures against snow avalanches directly indicate urban management and land use planning (zoning) of mountain areas. For example, in Italy, the Carte di Localizzazione Probabile delle Valanghe (C.L.P.V.) highlight the areas potentially affected by avalanche phenomena based on eyewitness and/or historical archives, as well as the analysis of the parameters that characterize an potential area of avalanche release (dynamics, morphology, inclination, exposition, vegetation, etc ...). The C.L.P.V. are coupled with Piani delle Zone Esposte al Pericolo Valanghe (P.Z.E.V.) which subdivide the recognised avalanche basin in three danger degrees (high, medium and low) plus the "presumed" null. On the basis on the different regional laws, in each of the identified avalanche areas, the planning indicates a well-defined requirements such as the prohibition to build [8].

Example of EU excellence and the first (and only) in Italy, the Regional Law n.11/98 of the Aosta Valley links the planning of the regional territory on the natural hazard: landslides, snow avalanches and floods. About snow avalanches, in all regional territory the avalanche basins are identified thanks to the historic information and environmental features (altitude, slopes, vegetation, geology, weather conditions, etc ...). Each basin is subdivides according to estimated (by dynamical models) impact pressure induced by the maximum avalanche event known or statistically defined considering a return period of 100 years. The human-life in the avalanche basin is governed by the planning of three avalanche danger degrees (high in red, medium in yellow and low in green) based on a range of the estimated avalanche impact pressure (more than 3 t/mq, between 0,5 and 3 t/mq and less than 0,5 t/mq, respectively) of the reference avalanche (Fig. 2). For each avalanche degrees, the regional law defined the requirements to build (or not to build) and what it is possible to build, but not how to build. Nowadays, in Europe, there are no laws or technical standards that regulate how to protect structures from the danger of dense or powder part of snow avalanches, reducing their vulnerability or designing and building properly. These hazard maps are obviously the result of an important analysis of the territory, from the morphological, geological and forestry point of view, linked to the study of the local climatic conditions, avalanche investigations on the past events (historical memory) together with the analysis of possible dynamics of the avalanche phenomenon based on different snow conditions and the subsequently choose of the best avalanche dynamics model (analytical, statistical or continuous) to identify, essentially, two unknown dynamic variables: the velocity and the density of the flow avalanches in time and space. Fundamental parameter to estimate the runout distance and the avalanche impact pressure for each basin, the flux velocity can be estimated thanks to a sophisticated commercial dynamic 3D models based on the morphology of the ground. The variability in space and time of the flux density is now not physically understand: for instance the flux density is considered constant and chosen in the range of 200 and 550 kg/mc.

So, avalanche hazard maps are “dynamic”: they may update over the years with the integrations of information given studying new events. For example, after the event in 2008 of Les Thoules avalanche in Valsavarenche (AO), the old hazard map (in which destroyed houses where in a low risk – green - zone) was update with the perimeter of catastrophic avalanche of 2008. After the realisation of active structure defences (714 snow-umbrella to cover 2,6 km of the length and an amount of 2.245.000 Euro), considering the positive effect of the structure defence, the definition of the risk in the hazard map has been revised (Fig. 2).

Fig. 2: The avalanche hazard map (Carta Ambiti inedificabili Art. 37 LR 11/98) of Loc. Les Thoules in Valsavarenche (AO) revised after major intervention in relelease area.

An example of erased historical memory is the event of the same December 2008 in Ceresole Reale (TO) [6]. In this case, the chalets destroyed by avalanche were cartographically indicated in white or “free of risk” area, outside the avalanche perimeter. Few years ago, a deeper historical research discovered the presence of a wall against avalanche to protect houses now flooded by the artificial lake of Ceresole Reale. The water covered the ancient defence structure and lose the historical memory on the arrest distance at 200m height below the houses destroyed in December 2008.

The Past usually helps avalanche planning. Easily, avalanche areas usually present toponyms as Lavanche, Lavanchey, Lavancher (which reminds us the avalanche of Lavancher village in Morgex-AO); lavèntsé in patois means a place where an avalanche falls. The word lavèntse (snow avalanche), derived from the Latin word Labina (landslide). In the lower Aosta Valley, to designate avalanche areas, it is possible to find Combia, Quiomba, probably from Latin word Cumulus, in this case, of snow. The Lavancher village is also an example of urban land influenced by natural hazard. The village is developed around the church (dedicated to St. Anna, protector of landslides and snow avalanches) in the right hands of the avalanche basin, while the two new houses destroyed by ‘90s event are isolated and away from the core of the village.

Another example of urban land development influenced by natural hazard is the village of Elevaz in Pré-Saint-Didier (AO). At an altitude of 1.302m asl, Elevaz is a sixteenth-century village with a population about 40 people and set on degrading bands parallel to the main road that connects it with La Thuile and Pré Saint Didier. In this village, avalanche phenomenon is directly related to the urban land development and this architecture. With the South limit dictated by S.S. 26, Elevaz grew up to North to a major rock, to East up to the gutter line and to West to avalanche structure defence (Fig. 3 in black). The inhabited area presents a triangular shape with the oldest (1600’s) to the northwest. The town is therefore protected from interference with snow avalanches.

The viability of the village consists in 3 main roads that allow vehicular traffic - two parallel to the S.S. 26 and the other one that reaching the centre across the fields. The internal only pedestrian roads are a tangle of narrow rock paved streets leading to the core of the village represented by a chapel (Fig. 3 in red) dedicated to San Defendente, another Saint devoted to snow avalanches [1].

Fig. 3: The village of Elevaz – Pré-Saint_Didier (AO): avalanche phenomena directly meddled with architecture and urban land development.

2.2 Avalanche and Architecture

Not only the planning, but also the interior and exterior design was influenced by avalanches. For example, in Elevaz, the typical houses made in wood and stone present the stable (on the ground floor), the living area (on the first floor) and the barn (on the top floor), which are usually accessed by way upstream. All households, also built in later periods (eighteenth century), have openings only in the downstream facades and the door on the first floor served by stairs, essential in the presence of the snowpack or avalanche deposit. The development of the Elevaz shows also a characteristic construction method that inserted house into another one – sharing, for example the roof or a wall - giving rise to a complex and articulated plot that composes a real boundary wall against avalanche around the perimeter of the village.

Typical architecture against snow avalanche can be found also in some recent underground or semi-underground constructions (80's) devoted as garages in which there is not the necessity of natural lighting inside the building. In Swiss literature, they are called Ebenhöch (Fig. 4) where the side of the roof exposed to avalanche is continuous with the morphology of the ground. The idea of this type of building stems from the belief that the continuity of the slope and a good fit to the ground can protect the building from the direct impact of the avalanche, loaded only by sliding snow masses. In this way, the absence of directly impact surfaces on the external walls and obstacles on the avalanche flow, eliminates the risk of damage to the structure. Typical for avalanche hazard areas, this architecture derives directly from hiding to protect people from an event. The concept of hiding arises from the inability to stop the avalanche without causing damage or injury.

Fig. 4: Some examples of Ebenhöch: a garage in Elevaz, Pré-Saint-Didier (AO) and a Durupt's house in Pesey Nancroix (FR) [9].

Transferring the project design of the passive structure defense against typical architecture of dams and braking wedges is directly integrated with the architecture of the houses, giving a particular shapes of buildings called, in Swiss literature, Spaltkeil. Although not new (in alpine areas, there are some distinctive architecture protected upstream by a wedge of stone, for example the Credemi-Kredemi pasture in the Gressoney Valley (AO) – Fig. 5), the idea is also used for new construction or maintenances in avalanche hazard area. For example the Frauenkirch in Davos (CH) (Fig. 5) built in 14th century and an '70s house in Le Pont village in Val Ferret - Courmayeur (AO).

Fig. 5: Some examples of Ebenhöch: the Credemi-Kredemi pasture in the Gressoney Valley (AO) [10] and the Frauenkirch in Davos (CH) [11].

A deviation of a slow avalanche flow can be easily obtained thanks to the extension of a wall on the side avalanche impact direction to protect access, balconies, gardens and external lateral zones of a building. Typically in concrete, this “wing of wall” is just an arm of the deviating wedge directly integrated in the architecture of the building [9]. Other typical architectures against avalanche require a little change in Alpine architecture of the roof with the elimination of its drip edge, in order to avoid uncovering of the roof due to the depression induced by the avalanche impact.

The architecture against snow avalanche shows its highest expression on the study of the shape of construction: the reconstruction (1990's) of the 1600's church dedicated to San Giovanni Battista in Mogno - Maggia Valley, Canton Ticino (CH), destroyed by a catastrophic event in 1986 is the most important project (Fig. 6). With its cylindrical shape elliptical sloping down to the circular shape at the roof (to reduce areas of potential impact and, consequently, the impact pressure), the structure is made in double masonry blocks of Riveo grey stone and Peccia white marble filling with reinforced concrete, while the roof is made in glass supported by a metal structure [12].

Fig. 6: The church dedicated to San Giovanni Battista, Mogno, Valle Maggia (CH) [12, 13].

2.3 Avalanche and Engineering

Thanks to the reliability of construction techniques, new technologies and the application of innovative materials, the avalanche risk mitigation may be done by an appropriate and targeted design. Subject to the estimation of the impact pressure and height of the avalanche flow provided by a proper analysis of the avalanche dynamics, it is now possible to realise structures and infrastructures that resist to avalanche interference in a medium and low hazard areas.

There are two most important research objectives in this framework: the first is the understanding the load induced by the avalanche impact on the building, the second sees the correct design using innovative materials (e.g. FRP, etc ...) for both new construction as well as renovations. The DISEG - Department of Structural Building and Geotechnical Engineering of Politecnico di Torino wrote the first European guidelines for the mitigation of avalanche risk through the design [14]. Beyond the guidelines, through a deep understanding of the dynamics of the avalanche phenomenon, there is an analysis of the effects of the avalanche impact on the structures thanks to the study of: theoretical and experimental (from direct measurements on site) pressure profiles, shape coefficients, direction of the snow flow and its velocity profiles. This is linked to the Civil Engineering evaluating the resistance of structural elements for each type of building material (reinforced concrete, wood, steel and masonry) against the stresses imposed by the avalanche phenomenon. The guidelines (on-line at www.risknat-alcotra.org) are the one of the most important result of a research activity of Snow and Avalanche Engineering group at DISEG - Politecnico di Torino. They are addressed to the two key issues of the study of avalanche dynamics: the measurements and the estimation of the impact pressures range induced by an avalanche and the understanding of the failure mechanisms of different kinds of buildings.

The available tools at DISEG to pursue the research on avalanche impact on building are essentially three. The first is the experimental site of Punta Seehore in Gressoney-La-Trinité (AO) in the Monterosa Ski resort [15, 16, 17, 18]. The slope, with an altitude difference of about 300 m (from 2.300 to 2.570 m asl), has a mean inclination of about 38°. Generally small/medium size avalanches are artificially released for the security of the ski-runs; they are usually dense flow avalanches but also a powder cloud may occasionally form; the release volume is around 200-400 mc (Fig. 7). The site is instrumented with a steel obstacle on which load cells and other devices are installed in order to measure the effects of the avalanche impact on it. The first two recorded avalanches showed an

impact force on the obstacle up to 5 kN on a flow height of 60 cm. Different kind of activities are made before, during and after each artificial release: physical and mechanical properties of the snow in the release, track and deposition zones of the avalanche are recorded, front velocity, erosion and deposition mass are estimated by field surveys or by multi-pictures analysis and laser-scan measurements.

Fig. 7: Avalanche artificial release at P.ta Seehore experimental site in Gressoney-La-Trinité (AO) [15,16,17,18].

The second is the back-analysis of structural damage caused by avalanches events. Thanks to the structural back-analysis of avalanche events of Lavancher in Morgex (AO) [19] and Les Thoules in Valsavarenche (AO) [4, 5] and forest damage in Lavancher and in Ceresole Reale (TO) [6] was possible understand some collapse mechanisms of roofs and walls for reinforced concrete, masonry and wood structures and the total possible collapse of traditional wooden chalets.

The third is the development and use of dynamics models for the assessment of avalanche flow velocity lines. In order to analyse the problem from a numerical point of view, a FEM model considering the avalanche as a fluid is implemented. It can be considered in its transient version (the two dimensional Navier-Stokes equations are coupled with the level set method, suitable for the free boundary conditions with the evolution in time) as well as in its stationary one (the Navier-Stokes equations are sufficient to describe the avalanche behaviour and a simplified a 3D analysis can be carried out). The software is able to understand the influence of the shape of obstacle on the avalanche impact pressure (Fig. 8) and calculate the C_d and C_p coefficients [4].

The research carried out, coupled with the guidelines, is essential to develop the research on snow and avalanches engineering and to support technicians and experts to design structures and planning maps considering a quasi-unknown (from physical, dynamic and loading point of view) hydrogeological phenomenon without technical and national regulations.

Fig. 8: Simulation of a impact pressure on the velocity field streamline on buildings of Les Thoules village (Valsavarenche – AO) during the 2008 avalanche event [4].

3. Conclusions

In recent years we are witnessing a resurgence of events attributed to various causes: from climate changes on our planet, the lack of maintenance of the environment, poor urban management of the territory. But the rapid development of the mountain tourism and the economy has led to its rapid and intense urbanization, resulting in increased attendance and consequent rise up of the risk.

However, people have always lived with hydrological hazard by observing, assessing and trying to avoid its consequences. Today, thanks to technological innovation, we are able to adequately protect from catastrophic avalanche events, respect for nature and the environment that surrounds us.

The financial support provided by Regione Autonoma Valle d'Aosta in the framework of MAP³ project – P.O. Italia-Francia (Alps – ALCOTRA) is gratefully to acknowledge.

The gap between the developed and the experience in the architectural space

Najar_ons@topnet.tn

Abstract

The aim of this work is to look at the interaction between the man and his surrounding architectural space. The purpose of the research investigation is to demonstrate the gap between the designer's conception as a way of space thinking and users perception. The investigation takes place from the principle that in a same spatial outfit many levels of apposite places are interlinked, and that these places are themselves tributary of temporal space configurations outlined by the space users. The main task is to extract the values and further concepts in order to make a distinction between static and dynamic configurations. These gaps have allowed us to put forward the different levels of opposite places, knowing that concepts are 'interpreted' and 'said' in different ways according to their understanding, perception and representation by different users and actors.

The study makes two assumptions, valuing the singularity of human being in his behaviour and the importance of his integration during the space design phase, in order to reduce from one side the gap between the conceived and the perceived space, and to highlight the complexity of these two actions. In this context banking space is taken as investigation support.

Keywords: Gap, Conceived/perceived, apposite places, semiotic reading, concepts.

Architectural space is a contextual configuration of the space that allows the development of the activity. Architectural space is often interpreted in relation to its form, distribution, function but not in the signification it generates. The space is defined through its Cartesian dimensions and the space is apprehended by the designer as a two-dimensional image representing approximately a three dimensional space. The notion of movement gave birth to a fourth dimension that is "time", space is constantly evolving over time. As in the visual sense, the space is seen, but also experienced by other senses. The space is taken up by all the human senses, they can have a spatial perception which gives rise to a reaction in humans causing an emotional connection with the perceived space. Man interacts with the space through sensor motor abilities, he uses all of his five senses to define the first benchmarks understanding of space, and this is the primary means of making contact space. The space is also included to the direction it generates and its function, as it awakens in us in terms of feelings and sensations.
